Chlorine is used commercially for the extraction of gold (q.v.) and for the manufacture of "bleaching powder" and of chlorates. It also finds an extensive use in organic chemistry as a substituting and oxidizing agent, as well as for the production of hydrochloric acid (see Hydrochloric Acid). The free element is used as a rule only works slowly on saturated compounds, but the reaction may be accelerated by the action of sunlight or on warming, or by using a "carrier." In these latter cases the reaction may proceed in different directions, forming, for example, hydrogen chloride, chlorine in the cold or in the presence of a carrier substitutes in the benzene nucleus, but in the presence of sunlight or on warming, substitution takes place in the side chain. Iodine, antimony trichloride, molybdenumhexachloride, ferric chloride, ferric oxide, antimony, tin, stannic oxide and ferric sulphate have all been used as chlorine carriers. The atomic weight of chlorine was determined by J. Berzelius and by F. Penny (*Phid. Trans.*, 1839, 13). J. S. Stas, from the synthesis of silver chloride, obtained the value 35-457 (O = 16), and C. Marignac found the value 34-462. More recent determinations are: H. B. Dixon and E. C. Edgar (*Phid. Trans.*, 1908); T. W. Richards and G. Jones (*J.C.S.* 1903) and R. C. W. W. A. Noyes and H. C. W. W. K. J. C. S. 1908), and Edgar (ibid., 1908).

Hydrochloric Acid.—Chlorine combines with hydrogen to form hydrochloric acid, HCl, the only known compound of these two elements. The acid itself was first obtained by J. R. Glauber in about 1648, but J. Priestley in 1772 was the first to isolate it in the gaseous condition, and Sir H. Davy in 1810 showed that it contained hydrogen and chlorine only, as up to that time it was considered to contain oxygen. It may be prepared by the direct union of its constituents (see Burgess and Chapman, *J.C.S.*, 1906, 89, p. 1309), but on the large scale and also for the preparation of small quantities it is made by the decomposition of salt by means of concentrated sulphuric acid, NaCl + H₂SO₄ = NaHSO₄ + HCl. It is chiefly obtained as a by-product in the manufacture of soda-ash by the Leblanc process (see Alkali Manufacture). The commercial acid is usually yellow in colour and contains many impurities, such as traces of arsenic, sulphuric acid, chlorine, ferric chloride and sulphurous acid; but these do not affect its purity or application to the preparation of any other chloride powder, in which it is chiefly used.

Without further purification it is also used for "souring" in bleaching, and in tin and lead soldering.

It is a colourless gas, which can be condensed by cold and pressure to a liquid boiling at 83-3° C., and can also be solidified, the solid melting at -112-5° C. (K. Olsewski). Its critical temperature is 52-3° C., and its critical pressure is 86 atmos. The gas lumes strongly in moist air, and it is rapidly absorbed by absorbing 800 volumes of the gas. The gas does not obey Henry's law, that is, its solubility in water is not proportional to its pressure. It is one of the "strong" acids, being ionized to the extent of about 91-4% in decinormal solution (1905). One litre of solution of 15° C. contains 42-9% of HCl, and has a specific gravity of 1-212. Perfectly dry hydrochloric acid gas has no action on metals, but in aqueous solution it dissolves many of them with evolution of hydrogen and formation of hydrochloric acid.

The salts of hydrochloric acid, known as chlorides, can, in most cases, be prepared by dissolving either the metal, its hydroxide, oxide, or carbonate in the acid; or by heating the metal with concentrated hydrochloric acid, or by precipitation. The majority of the metallic chlorides are solids (stannic chloride, titanium chloride and antimony pentachloride are liquids) which readily volatilize on heating. Many are readily soluble in water, the chief exceptions being the bismuth chloride, of which the tetrachloride which are insoluble in water, and thallous chloride and lead chloride which are only slightly soluble in cold water, but are readily soluble in hot water. Bismuth and antimony chlorides are decomposed by the introduction of chlorine into the solution, and tetrachloride yields titanium acid under the same conditions. All the metallic chlorides, with the exception of those of the alkali and alkaline earth metals, are reduced either to the metallic condition or to that of 2 mol of chlorine; most are decomposed by concentrated sulphuric acid. They can be distinguished from the corresponding bromides and iodides by the fact that on distillation with a mixture of potassium bichromate and sulphuric acid they yield the metal in an acid chlorate, whereas bromides and iodides by the same treatment give bromine and iodine respectively. Some metallic chlorides readily form double chlorides, the most important of these double salts being the platinum chlorides of the type [PtCl₄]₂⁻. Non-metallic elements are usually volatile fuming liquids of low boiling-point, which can be distilled without decomposition and are decomposed by water. Hydrochloric acid and its metallic salts can be converted into the corresponding hydrochlorides by treatment with standard silver nitrate solution, using potassium chromate as an indicator.

Chlorine and oxygen do not combine directly, but compounds can be obtained indirectly, such as those obtained from perchloric acid, ClO₃H, chloric oxide, ClO₂, and chloric oxide, ClO₃.

Chlorine monoxide results on passing chlorine over dry precipitated mercuric oxide. It is a pale yellow gas which can be condensed, on cooling, to a dark-coloured liquid boiling at 5° C. (under a pressure of 760 mm.). It is extremely unstable, decomposing with extreme violence on the slightest shock or disturbance, or on exposure to sunlight. It is readily soluble in water, with which it combines to form hypochlorous acid. Sulphur, phosphorus, carbon compounds,
and the alkali metals react violently with the gas, taking fire with explosive decomposition. A. J. Baland determined the volume composition of the gas by decomposition over mercury on gentle warming, followed by the absorption of the chlorine produced with potash-hydrosulphide, and then measured the residual gas.

Chlorine peroxide was first obtained by Sir H. Davy in 1815 by the action of concentrated sulphuric acid on potassium chlorate. As this oxide is a dangerous explosive, great care must be taken in its preparation; the chlorine is finely powdered and added in the correct proportion to the acid, which is then distilled over, until the reaction is checked by the evolution of the chlorine gas, when the remaining acid is titrated with sodium hydrate. After solution the peroxide is gently heated by warm water when the gas is released:

\[ 3\text{KClO}_3 + 2\text{H}_2\text{SO}_4 \rightarrow \text{KClO}_4 + 2\text{KHSO}_4 + \text{H}_2\text{O} + \text{Cl}_2 \]

A mixture of chlorine peroxide and chlorine is obtained by the action of potassium chlorate on a solution of potassium peroxide. The solution is warmed with a mixture of potassium chlorate and oxalic acid to 70°C. On the water bath, a mixture of chlorine peroxide and carbon dioxide is obtained. Chlorine peroxide may be collected by displacement of chlorine by hydrogen or by the action of a solution of potassium chlorate on a mixture of potassium peroxide and carbon dioxide.

Chlorine hypochlorite was obtained by A. Michael by slowly adding perchloric acid to phosphoric acid below -10°C; the mixture is allowed to stand for a day and then gently warmed, when the oxide distils off as a colourless very volatile oil of boiling-point 82°C. It is then distilled and dried over a fixed bed of calcium chloride, when a heavy gas of a deep yellow colour and possesses an unpleasant smell. It can be liquefied, the liquid boiling at 9-9°C, and on further cooling it solidifies at -79°C. It is very explosive, being resolved into its components by influence of light, on warming or on application of shock. It is a very powerful oxidant; a mixture of potassium chlorate and sugar in about equal proportions spontaneously inflames when touched with a rod moistened with concentrated hydrochloric acid, and is ignited by the fire of a white phosphorus like the sugar, which goes on burning. Similarly, phosphorus can be burned under water by covering it with a little potassium chlorate and running in a thin stream of concentrated sulphuric acid (see p. 257).

Similarly, phosphorus can be burned under water by covering it with a little potassium chlorate and running in a thin stream of concentrated sulphuric acid (see p. 257).

Several oxo-acids of chlorine are known, namely, hypochlorous acid, HClO; chlorous acid, HClO₂; peroxochloric acid, HClO₃; and perchloric acid, HClO₄. Hypochlorous acid is formed when chlorine monoxide dissolves in water, and can be prepared in concentrated form by passing chlorine through a solution of potassium permanganate. Hypochlorous acid is distinguished from chlorine monoxide by its colour, which changes from yellow to green when heated to 380°C, into iodine, and oxygen; bromine is without action (see A. Michael, Amer. Chem. Journ., 1900, vol. 23: 1901, vol. 25).

Michael, Amer. Chem. Journ., 1900, vol. 23: 1901, vol. 25).

Chlorous acid is formed by the reaction of trichlorine in the presence of carbon dioxide and water, and is best prepared by decomposing baryum chlorite with the calculated amount of dilute sulphuric acid. The aqueous solution can be concentrated in vacuo over sulphuric acid until it contains 40% of chlorous acid, and the concentrated solution is decomposed, with evolution of oxygen and formation of perchloric and chlorous acids, a solution of perchloric acid containing a solution of perchloric acid is a powerful oxidizing agent; organic matter being oxidized so rapidly that it frequently inflames. Hypochloric acid is obtained by the action of oxygen and sulphuric acid are rapidly oxidized by hypochloric acid. The flames of hypochloric acid are distinguished by their green colour and the remarkable property of the chlorine. The solutions of chlorine are unstable, being decomposed with explosive violence at 100°C.

On adding a caustic alkali solution to one of chlorine peroxide, a mixture of a chlorite and a chlorate is obtained.

A white crystalline mass of hydrated perchorlie acid, HClO₄·H₂O, passes over; this is due to the decomposition of some of the acid into water and lower oxides of chlorine, the water produced then combining with the pure acid to produce the hydrated form. This solid, red, or red-brown, the pure acid, which melts at 39°C (under a pressure of 65 mm.) and of specific gravity 1.764 (25°C), is known as the perchlorates, and are all soluble in water; the potassium and rubidium salts, however, are only soluble to a slight extent. Potassium perchlorate, KClO₄, can be obtained by carefully heating the chlorate salt with potassium carbonate, and the anhydrous acid used in the latter process is extracted with water to remove potassium chlorate, and warmed with hydrochloric acid to remove unaltered chlorate, and finally extracted with water after, when a residue of practically pure perchlorate is obtained. The alkali perchlorates are isomorphous with the perammoniates.

### CHLORITE

CHLORITE, a group of green micaceous minerals which are hydrous silicates of aluminium, magnesium and ferrous iron. The name was given by A. G. Werner in 1798, from χλόριτης, “a green stone.” Several species and many rather ill-defined varieties have been described, but they are difficult to recognize. Like the micas, the chlorites (or "hydromicas") are monolitic in crystallization and have a perfect cleavage parallel to the flat faces of the scales and plates. The cleavage is, however, not so perfect as that of mica, and the cleavage flakes, though plicate, are not elastic. The chlorites usually occur as salt (H=2-3) scaly aggregates of a dark-green colour. They vary in specific gravity between 2-6 and 3-0, according to the amount of iron present. Well-developed crystals are met with only in the species clinoclore and penminitle; those of the former are six-sided plates and are optically biaxial, whilst those of the latter have the form of acute rhomboids and are usually optically uniaxial. The species prochlorite and corundophilite also occur as more or less distinct six-sided plates. These four better crystallized species are grouped together by G. Tschermak as orthochlorites, the finely scaly and indistinctly fibrous forms being grouped by the same author as leptochlorites.

Chemically, the chlorites are distinguished from the micas by the presence of a considerable amount of water (about 13%) and by not containing alkalies; from the soft, scaly, mineral talc they differ in containing aluminium (about 25%) as an essential constituent. The magnesia (up to 36%) is often in part replaced by ferrous oxide (up to 30%), and the alumina by the oxide of extenuating ferric oxide; alumina may also be partly replaced by chronic oxide, as in the rosenites; künstlerite and kotschubite. The composition of both clinoclore and penminitle is approximately expressed by the formula H₄(Fe,Mg₃-Al₂Si₃O₁₀), and the formulae of prochlorite and corundophilite are H₄(Fe₃-Al₂Si₃O₁₀) and H₄(Mg₃Fe₃-Al₂Si₃O₁₀) respectively. The variation in composition of these orthochlorites is explained by G. Tschermak by assuming them to be isomorphous mixtures of H₄Mg₂Si₃O₁₀ (the serpentine molecule) and H₄Mg₃Al₂Si₃O₁₀ (which is approximately the composition of the chlorite amesite). The lepto-chlorites are still more complex, and the intermixture of other fundamental molecules has to be assumed; the species recognized by Dana are daphnite, croustedite, thuringite, stipholomene, stigovite, diabantite, aphasiderite, delesite and rumpsite.

The chlorites usually occur as alteration products of other minerals, such as pyroxene, amphibole, biotite, garnet, &c., often occurring as pseudomorphs after these, or as earthy matrix filling cavities in igneous rocks composed of these minerals. Many altered igneous rocks owe their green colour to the presence of secondary chlorite; the chlorite is also an important constituent of many schistose rocks and phyllites, and of chlorite-schist it is the only essential constituent. Well-crystallized specimens of the species clinoclore are found with crystals of garnet in cavities in chlorite-schist at Achmatovka, near Zlatoust, in the Ural, and at the Ala valley near Turin.
CHLOROFORM—CHMIELNICKI

257

Piedmont; also as large plates at West Chester in Pennsylvania and at other American localities. Crystals of peninnite are found in serpentine at Zermatt in Switzerland and in the green schists of the Zillerthal in Tirol.

Closely allied to the chlorites is another group of micaeous minerals known as the vermiculites, which have resulted by the alteration of the micas, particularly biotite and phlogopite. The name is from the Latin vermicular, "to breed worms," because when heated before the blowpipe these minerals exfoliate into long worm-like threads. They have the same chemical constituents as the chlorites, but the composition is variable and indefinite, varying with that of the original mineral and the extent of its alteration. Several indistinct varieties have been named, the most important of which is jeffersonite.

(L. J. S.)

CHLOROFORM (trichloro-methane), CHCl₃, a valuable anaesthetic, a colourless liquid, possessing an agreeable smell and a pleasant taste. It may be prepared by the action of bleaching powder on most carbon compounds, such as, for example, as ethyl alcohol and acetone (E. Soubeiran, Ann. chem. phys., 1831; 2, 48, p. 131; J. v. Liebig, Ann., 1832, 1, p. 199), by heating choral with alkalis (Liebig), CCl₄CHO + NaOH = CHCl₃ + NaHCO₃ or by heating trichloracetic acid with ammonia (J. Dumas, Ann., 1839, 32, p. 113). In the preparation of chloroform by the action of bleaching powder on ethyl alcohol it is probable that the alcohol is first oxidized to acetaldehyde, which is subsequently chlorinated and then decomposed. Chloroform solidifies in the cold and then melts at -62°C; it boils at 61.9°C, and has a specific gravity 1.52637 (0/°C) (T. E. Thorpe). It is an exceedingly good solvent, especially for fats, alkaloids and iodine.

It is not inflammable. The vapour of chloroform when passed through a red-hot tube yields hexachlorobenzene C₆Cl₆, perchloroethane C₂Cl₄, and some perchloroethylene C₃Cl₄ (W. Ramsay and S. Young, Jahresbericht, 1856, p. 628). Chromic acid converts it into phosgene (carbonyl chloride, COCl₂). It reacts with sodium ethylate to form ortho-orthoformic ester, CH₂OC(OC₂H₅)₂ and when heated with aqueous ammonia for some hours at 200-220°C gives carbon monoxide and ammonium formate, 2CHCl₃ + 2NH₃ + 3H₂O = NH₂HCO₂ + CO + 6NH₄Cl (G. André, Jahresber., 1886, p. 627). When digested with phenols and caustic soda it forms oxaldehydes (K. Reimer, Ber., 1876, 9, p. 423); and when heated with alcoholic potash it is converted into potassium formate, CH₂Cl + 4KOH = KHCO₂ + 3KCl + 2H₂O. It combines with acetic ester to form the aromatic compound meta-oxyactic acid, CH₂C₂H₂OB-(COOH). A hydride, of composition CH₂ClH₂-18H₂O, has been described (G. Chancel, Fresenius Zeitschrift f. anal. Chemie, 1886, 25, p. 118); it forms hexagonal crystals which melt at 1.6°C.

Chloroform may be readily detected by the production of an isonitrile when it is heated with alcoholic potash and a primary amine; thus with aniline, phenyl isocyanide (recognized by its nauseating smell) is produced, and CH₂Cl + 2NH₂H₂ = C₆H₅NH₂ + 3H₂O. For the action and use of chloroform as an anaesthetic, see Anaesthesia. Chloroform may be given internally in doses of from one to five drops. The British Pharmacopoeia contains a watery solution—the Aque Chloroformato—which is useful in disguising the taste of nauseous drugs; a liniment which consists of equal parts of camphor liniment and chloroform, and is a useful counter-irritant; the Spiritus Chloroformi (erroneously known as "chloric ether"), which is a useful anodyne in doses of from five to forty drops; and the Tinctura Chloroformi et Morphinae Composita, which is the equivalent of a proprietary drug called chlorodyne. This tincture contains chloroform, morphine and prussic acid, and must be used with the greatest care.

Externally chloroform is an antiseptic, a local anaesthetic if allowed to evaporate, and a rubefacient, causing the vessels of the skin to dilate, if rubbed in. Its action on the stomach is practically identical with that of alcohol (q.v.), though in very much smaller doses. The uses of chloroform which fall to be mentioned here are—as a counter-irritant; as a local anaesthetic for toothache due to caries, it being applied on a cotton-wool plug which is inserted into the carious cavity; as an antispasmodic in tetanus and hydrophobia; and as the best and most immediate and effective antidote in cases of strychnine poisoning.

CHLOROPHYLL (from Gr. χλόα, green, φύλλον, a leaf), the green colouring matter of leaves. It is universally present in growing vegetable cells. The pigment of leaves is a complex mixture of substances; of these one is green, and to this the name, originally given in 1817 by Pelletier and Caventou, is sometimes restricted; xanthophyll (Gr. κασθιδα, yellow) is dark brown; carotin is copper-coloured. Chlorophyll is related chemically to the proteins; a decomposition product, phylloporphyrin, being very closely related to haematomorphyrin, which is a decomposition product of haemoglobin, the red colouring matter of the blood. Chlorophyll is neutral in reaction, insoluble in water, but soluble in alcohol, ether, &c., the solutions exhibiting a green colour and a vivid red fluorescence. Magnesium is a necessary constituent. (See S. B. Schryver, Science Progress, 1900, 1, 253.)

CHLOROSIS (Gr. χλόα, pale green), the botanical term for loss of colour in a plant-organ, a sign of disease; also in medicine, a form of anaemia (see Blood: Pathology).

CHLORPICIN (Nitrochloroform), C₅NO₂Cl₃, the product of the distillation of many nitro compounds (picric acid, nitromethane, &c.) with bleaching powder; it can also be prepared by the action of concentrated nitric acid on chloral or chloroform.

A. W. von Hofmann (Annalen, 1866, 139, p. 111) mixed 10 parts of bleaching powder into a paste with cold water and added a solution (saturated at 30°C.) of 1 part of picric acid. A violent reaction is set up and the chloropicrin distils over, generally without the necessity for any external heating. It is a colourless liquid of boiling-point 112°C, and of specific gravity 1-692. It is almost insoluble in water, but is readily soluble in alcohol; it has a sharp smell, and its vapour affects the eyes very powerfully. Iron filings and acetic acid reduce it to trimethylamine, whilst alcoholic ammonia converts it into guanidine, HCN(NH₂)₂, and sodium ethylate into ortho-carboxyl, ester, C(OC₂H₅)₃. The corresponding bromopicrin is also known.

CHMIELNICKI, BOGDAN (c. 1593-1657), hetman of the Cossacks, son of Michael Chmielnicki, was born at Subatow, near Chigirin in the Ukraine, an estate given to the elder Chmielnicki for his lifelong services to the Polish crown. Bogdan, after learning to read and write, a rare accomplishment in those days, entered the Cossack ranks, was dangerously wounded and taken prisoner in his first battle against the Turks, and found leisure during his two years' captivity at Constantinople to acquire the rudiments of Turkish and French. On returning to the Ukraine he settled down quietly on his paternal estate, and in all probability history would never have known his name if the intolerable persecution of a neighbouring Polish squire, who stole his hayricks and flogged his infant son to death, had not converted the thrifty and acquisitive Cossack husbandman into one of the most striking and sinister figures of modern times. Failing to get redress nearer home, he determined to seek for justice at Warsaw, whither he had been summoned with other Cossack delegates to assist Wladislaus IV. in his long-projected war against the Turks. The king, perceiving him to be a man of some education and intelligence, appointed him pisar or secretary of the registered Cossacks, and he subsequently served under Koniecpolski in the Ukraine campaign of 1646. His hopes of distinction were, however, cut short by a decree of the Polish diet, which, in order to vex the king, refused to sanction the continuance of the war. Chmielnicki, now doubly hateful to the Poles as being both a royalist and a Cossack, was again maltreated and chicaned, and only escaped from gaol by bribing his gaolers. Thirsting for vengeance, he fled to the Cossack settlements on the Lower Dnieper and thence sent messages to the khans of the Crimea, urging a simultaneous invasion of Poland by the Tartars and the Cossacks (1647).

On the 11th of April 1648, at an assembly of the Zaporozhians (see Poland: History), he openly declared his intention of proceeding against the Poles, and was elected a tamman by acclamation.
At Zhltnaya Vodui (Yellow Waters) in the Ukraine he annihilated, on the 19th of May, a detached Polish army corps after three days' desperate fighting, and on the 26th routed the main Polish army under the grand hetman, Stephen Potocki, at Kruta Balka (Hard Plank), near the river Korsun. The immediate consequence of these victories was the outbreak of a "serfs" fury. Throughout the Ukraine the Polish gentry were hunted down, flayed and burnt alive, blinded and sawn asunder. Every manor-house was reduced to ashes. Every Uniat and Catholic priest was hung up before his own altar, along with a Jew and a hog. The panic-stricken inhabitants fled to the nearest strongholds, and soon the rebels were swarming all over the palatinates of Volhynia and Podolia. But the ataman was as crafty as he was cruel. Disagreeably awakened to the insecurity of his position by the refusal of the tsar and the sultan to accept him as a vassal, he feigned to resume negotiations with the Poles in order to gain time, dismissed the Polish commissioners in the summer of 1648 with impossible conditions, and on the 23rd of September, after a contest of three days, utterly routed the Polish chivalry, 40,000 strong, at Pildawa, where the Cossacks are said to have reaped an immense booty after the fight which he divided among all his soldiers, and then, finding the defenceless capital was open before him, but not wasted the precious months in vain before the fortress of Zamosc, and was then persuaded by the new king of Poland, John Casimir, to consent to a suspension of hostilities. In June 1649, arrayed in cloth-of-gold and mounted on a white charger, Chmielnicki made his triumphal entry into Kiev, where he was hailed as the Maccabaeus of the Orthodox faith, and permitted the committal of unspeakable atrocities on the Jews and Roman Catholics. At the ensuing peace congress at Pereyaslavl he demanded terms so extravagant that the Polish commissioners dared not listen to them. In 1649, therefore, the war was resumed. A bloody battle ensued near Zborov, on the banks of the Strypa, when only the personal valour of the Polish king, the superiority of the Polish artillery, and the defection of Chmielnicki's allies, the Tatars enabled the royal forces to hold their own. Peace was then patched up by the compact of Zborov (August 21, 1649), whereby Chmielnicki was virtually recognized as a semi-independent prince. For the next eighteen months he was the absolute master of the Ukraine, divided into sixteen provinces, made his native place Chigirin the Cossack capital, and entered into direct relations with foreign powers. Poland and Muscovy competed for his alliance, and in his more exalted moods he meditated an Orthodox crusade against the Turk at the head of the northern Slavs. But he was no statesman, and his difficulties proved overwhelming. Instinct told him that his old ally the khan of the Crimea was unreliable, and that the tsar of Muscovy was his natural protector, yet he could not make up his mind to abandon the one or turn to the other. His attempt to carve a principality for his son out of Moldavia, which Poland regarded as her vassal, led to the outbreak in 1651 of a third war between subject and suzerain, which speedily assumed the dignity and the dimensions of a crusade. Chmielnicki was now regarded not merely as a Cossack rebel, but as the arch-enemy of Catholicism in eastern Europe, and the pope granted a plenary absolution to all who took up arms against him. But Bogdan himself was not without ecclesiastical sanction. The archbishop of Corinth girded him with a sword which had lain upon the Holy Sepulchre, and the metropolitan of Kiev absolved him from all his sins, with the threat of immediate excommunication, before he rode forth to battle. But fortune, so long his friend, n.w. deserted him, and at Beresteczko (July 1, 1651) the Cossack ataman was defeated for the first time. But even now his power was far from broken. In 1652 he openly interfered in the affairs of Transylvania and Walachia, and assumed the high-sounding title of "guardian of the Ottoman Porte." In 1653 Poland made a supreme effort, the diet voted 17,000,000 gulden in subsidies, and John Casimir led an army of 60,000 men into the Ukraine and defeated the arch-rebel at Zranta, wherupon Chmielnicki took the oath of allegiance to the tsar (compact of Pereyaslavl, February 19, 1654), and all hope of an independent Cossack state was at an end. He died on the 7th of August 1657. With all his native ability, Chmielnicki was but an impetuous savage. He was the creature of every passing mood or whim, incapable of cool and steady judgment or of the slightest self-control—an incalculable weathercock, blindly oblivious to every blast of passion. He could destroy, but he could not create, and other people benefited by his exploits.

See P. Kulish, On the Defection of Malo-Russia from Poland (Rus.) (Moscow, 1890); S. M. Solovev, History of Russia (Rus.) (Moscow, 1857, &c.), vol. x.; Robert Nisbet Bain, The First Romanov, chaps. 3-5 (London, 1905).

CHOATE, JOSEPH HODGES (1832-1909), American lawyer and diplomat, was born at Salem, Massachusetts, on the 24th of January 1832. He was the son of Dr George Choate, a physician of considerable note, and was a nephew of Rufus Choate. After graduating at Harvard College in 1852 and at the law school of Harvard University in 1854, he was admitted first to the Massachusetts (1853) and then (1856) to the New York bar, and entered the law office of Scudder & Carter in New York City. His success in his profession was immediate, and in 1860 he became junior partner in the firm of Evarts, Southmayd & Choate, the firm for which he had been soon after admitted as a partner which William Evarts. This firm and its successor, that of Evarts, Choate & Bracefield, continued for many years among the leading law firms of New York and of the country, the activities of both being national rather than local. During these busy years Mr Choate was associated with many of the most famous litigations in American legal history, including the Tilden, A. T. Stewart, and Stanford lives, the Kansas prohibition cases, the Chinese exclusion cases, the Maynard election returns case, and the Income Tax Suit. In 1871 he became a member of the "Committee of Seventy" in New York City, which was instrumental in breaking up the "Tweed Ring," and later assisted in the prosecution of the indicted officials. In the retrial of the General Fitz John Porter case he obtained a reversal of the decision of the original court-martial. His greatest reputation was won perhaps in cross-examination. In politics he allied himself with the Republican party on its organization, being a frequent speaker in presidential campaigns, beginning with that of 1856. He never held political office, although he was a candidate for the Republican senatorial nomination in 1869 against Senator Thaddeus C. Plitt in 1897. He was president of the New York state constitutional convention. He was appointed, by President McKinley, ambassador to Great Britain to succeed John Hay in 1899, and remained in this position until the spring of 1905. In England he won great personal popularity, and accomplished much in fostering the good relations of the two great English-speaking powers. He was one of the representatives of the United States at the second Peace Congress at the Hague in 1907.

Several of his notable public addresses have been published. The Choate Story Book (New York, 1903) contains a few of his addresses and after-dinner speeches, and is prefaced by a brief biographical sketch.

CHOATE, RUFUS (1799-1859), American lawyer and orator, was born at Ipswich, Massachusetts, on the 1st of October 1799, the descendant of a family which settled in Massachusetts in 1667. As a child he was remarkably precocious; at six he is said to have been able to repeat large parts of the Bible and of Pilgrim's Progress by heart. He graduated as valedictorian of his class at Dartmouth College in 1819, was a tutor there in 1819-20, was admitted to the bar in 1823, and in 1824 was the first law teacher at the Harvard University, and studied for a like period at Washington, in the omnibus with Wirt, then attorney-general of the United States. He was admitted to the Massachusetts bar in 1823 and practised at what was later South Danvers (now Peabody) for five years, during which time he served in the Massachusetts House of Representatives (1825-1826) and in the state senate (1827). In 1828 he removed to Salem, where his successful conduct of several important law-suits brought him prominently into public notice. In 1830 he was elected to Congress as a Whig from the Salem district, defeating the Jacksonian candidate for re-election,
B.W. Crowninshield (1772–1851), a former secretary of the navy, and in 1832 he was re-elected. His career in Congress was marked by a notable speech in defence of a protective tariff. In 1834, before the completion of his second term, he resigned and established himself in the practice of law in Boston. Already his fame as a speaker had spread beyond New England, and he was much sought after as an orator for public occasions. For several years he devoted himself unremittingly to his profession, but in 1841 succeeded Daniel Webster in the United States Senate. Shortly afterwards he delivered one of his most eloquent addresses at the memorial services for President Harrison in Faneuil Hall, Boston. In the Senate he made a series of brilliant speeches on the tariff, the Oregon boundary, in favour of the Fiscal Bank Act, and in opposition to the annexation of Texas. On Webster's re-election to the Senate, Choate resumed (1845) his law practice, which no amount of urging could ever persuade him to abandon for public office, save for a short term as attorney-general of Massachusetts in 1853–1854. In 1853 he was a member of the state constitutional convention. He was a faithful supporter of Webster's policy as declared in the latter's famous "Seventh of March Speech" (1850) and laboured to secure for him the presidential nomination at the Whig national convention in 1852. In 1856 he refused to follow most of his former Whig associates into the Republican party and gave support to James Buchanan, because he considered the representative of a national instead of a sectional party. In July 1859 failing health led him to seek rest in a trip to Europe, but he died on the 13th of that month at Halifax, Nova Scotia, where he had been put ashore when it was seen that he probably could not outlive the voyage across the Atlantic. Choate, besides being one of the ablest of American lawyers, was one of the most scholarly of American public men, and his numerous orations and addresses were remarkable for their pure style, their grace and elegance of form, and their wealth of classical allusion.

His *Works* (edited, with a memoir, by S.G. Brown) were published in 2 vols. at Boston in 1862. The *Memoir* was afterwards published separately (1870). See also E.G. Parker's *Reminiscences of Rufus Choate* (New York, 1860); E.P. Whipple's *Some Recollections of Rufus Choate* (New York, 1879); and the *Albany Law Review* (1877–1878).

**CHOBE**, a large western affluent of the middle Zambezi (q.v.). The river was discovered by David Livingstone in 1851, and to him was known as the Chobe. It is also called the Linyante and the Kwando, the last name being that commonly used.

**CHOCOLATE**, a paste of the ground kernels of the cacao bean, mixed with sugar, vanilla or other flavouring, and turned into a cake, which when cut into thin slices of various forms of sweetmeat, or in making the beverage, also known as "chocolate," obtained by dissolving cakes of chocolate in boiling water or milk (see COCOA). The word came into Eng. through the Fr. *chocolat* or *cacao* from the Mex. *chocolatl*. According to the *New English Dictionary* (quoting R. Simón, *Déct. de la langue Nahua*), this was "an article of food made of . . . the seeds of cacao and of the tree pochotl! (Bombax ceiba)," and was etymologically distinct from the Mexican *cacauatl*, cacao, or cocoa.

**CHOCATS, CHARTAS, or CHACATOS** (apparently a corruption of Span. *chato*, flattened), a tribe of North American Indians of Muskhogan stock. They are now settled in Oklahoma, but when first known to the Europeans they occupied the district now forming the southern part of Missisipi and the western part of Alabama. On the settlement of Louisiana they formed an alliance with the French, and assisted them against the Natchez and Chickasaws; but by degrees they entered into friendly relations with the English, and at last, in 1786, recognized the supremacy of the United States by the treaty of Hopewell. Their emigration westward began about 1800, and the last remains of their original territory were ceded in 1830. In their new settlements the Choctaws continued to advance in prosperity till the outbreak of the Civil War, which considerably diminished the population and ruined a large part of their property. They sided with the Confederates, and their territory was occupied by Confederate troops; and accordingly at the close of the war they were regarded as having lost their rights. Part of their land they were forced to surrender to the government; their slaves were emancipated; and provision was claimed for them in the shape of either land or money. Since then they have considerably recovered their position. They long constituted a quasi-independent people under the title of the Choctaw nation, and were governed by a chief and a national council of forty members, according to a written constitution, dating in the main from 1838; they possessed a regular judicial system and employed trial by jury. Tribal government virtually ceased in 1906. The Choctaws number some 18,000. A few groups still linger in Mississippi and Louisiana. The Choctaw language has been reduced to writing, and brought to some degree of literary precision.

See INDIANS, NORTH AMERICAN; Handbook of American Indians, ed. F.W. Hodge (Washington, 1907).

**CHODKIEWICZ, JAN KAROL** (1560–1621), Polish general, was the son of Hieronymus Chodkiewicz, castellan of Wilna. After being educated at the Wilna academy he went abroad to learn the science of war, fighting in the Spanish service under Alva and also under Maurice of Nassau. In 1593 he married the wealthy Sophia Mielecka, by whom he had one son who predeceased him. His military service at home was against the Cossack rising of Nawajewski as lieutenant to Zolkiewski, and he was subsequently adjutant to Vasa in his Polish campaign. He was appointed colonel in the Swedish army and served in the Thirty Years' War, and was made a count and a chief field marshal of Sweden in 1624. After the Peace of Prague he was sent to the Baltic with the Swedes, was created a baron, and was appointed governor of Livonia. He was killed in the Battle of Parnawa, 1629, and his son was created a count.

**CHODKIEWICZ, KAZIMIERZ** (1569–1627), Polish general, was the younger son of Hieronymus Chodkiewicz, castellan of Wilna. He received a classical education at the Wilna academy and was educated in England and Italy, where he was introduced to Alessandro Farnese, duke of Parma. He returned to Poland in 1594 and entered the service of the Polish king. He distinguished himself in the war against the Swedes and was appointed field marshal to the army of the Polish king. He led the Polish army in the Battle of Parnawa, 1629, and was killed in the battle. He was created a count posthumously.

**CHODKIEWICZ, WOLFGANG** (1576–1636), Polish general, was the son of Kazimierz Chodkiewicz, castellan of Wilna. He received a classical education at the Wilna academy and was educated in Italy and France. He entered the service of the Polish king and distinguished himself in the war against the Swedes. He was appointed field marshal to the army of the Polish king and led the Polish army in the Battle of Parnawa, 1629, and was killed in the battle. He was created a count posthumously.
his diminished forces. But the victory was dearly purchased by Poland. A few days before the siege was raised the aged grand

CHODOWIECKI, DANIEL NICOLAS (1726-1801), German painter and engraver of Polish descent, was born at Danzig. Left an orphan at an early age, he devoted himself to the practice of miniature painting, the elements of which his father had taught him, as a means of support for himself and his mother. In 1743 he went to Berlin, where for some time he worked as clerk in an uncle's office, practising art, however, in his leisure moments, and gaining a sort of reputation as a painter of miniatures for snuff-boxes. The Berlin Academy, attracted by a small engraving of his, entrusted to him the illustration of its yearly almanac. After designing and engraving several subjects from the story of the Seven Years' War, Chodowiecki produced the famous "History of the Life of Jesus Christ," a set of admirably painted miniatures, which made him at once so popular that he laid aside all occupations save those of painting and engraving. Few books were published in the course of his life, but plate-engraving was his life-work. It is not surprising, therefore, that the catalogue of his works (Berlin, 1814) should include over 3000 items, of which, however, the picture of "Jean Calas and his Family" is the only one of any reputation. He became director of the Berlin Academy in 1797. The title of the German Hogarth, which he sometimes obtained, was an acknowledgment of an admiration rather imaginative than critical, and was disclaimed by Chodowiecki himself. The illustrator of Lavater's Essays on Physiognomy, the painter of the "Hunt the Slipper" in the Berlin museum, had indeed but one point in common with the great Englishman—the practice of representing actual life and manners. In this he showed skilful drawing and grouping, and considerable expressive power, but no tendency whatever to the grotesque.

His brother Gottfried (1728-1791) and son Wilhelm (1765-1803) painted and engraved after the style of Daniel, and sometimes co-operated with him.

CHOERILUS. (1) An Athenian tragic poet, who exhibited plays as early as 524 B.c. He was said to have competed with Aeschylus, Pratinas and even Sophocles. According to F. G. Welcker, however, the rival of Sophocles was a son of Choerilus, who bore the same name. Suidas states that Choerilus wrote 150 tragedies and gained the prize 15 times. His work is lost; but Pausanias (i. 14) mentions a play by him entitled Alope (a mythological personage who was the subject of dramas by Euripides and Carcinius). His reputation as a writer of satyrlic dramas is attested in the well-known line

ήκε με βασίλειον καὶ Χαρίλος ἐν Σαρώνῃ.

The Choerilian metro, mentioned by the Latin grammarians, is probably so called because the above line is the oldest extant specimen. Choerilus was also said to have introduced considerable improvements in theatrical masks and costumes.

See A. Nauck, Tragicorum Graecorum Fragmenta (1889); F. G. Welcker, Die griechischen Tragödien, pp. 18, 892.

(2) An epic poet of Samos, who flourished at the end of the 6th century B.C.

After the fall of Athens he settled at the court of Archeclus, king of Macedonia, where he was the associate of Agathon, Melanippides, and Plato the comic poet. The only work that can with certainty be attributed to him is the Iapygos or Iapés, a history of the struggle of the Greeks against Persia, the central point of which was the battle of Salamis. His importance consists in his having taken for his theme national and contemporary events in place of the deeds of old-time heroes. For this new departure he apologizes in the introductory verses (preserved in the scholion on Aristotle, Rhetoric, iii. 14), where he says that, the subjects of epic poetry being all exhausted, it was necessary to strike out a new path. The story of his intimacy with Herodotus is probably due to the fact that he imitated him and had recourse to his history for the incidents of his poem.

The Perses was at first highly successful and was said to have been read, together with the Homeric poems, at the Panathenaea, but later critics reversed this favourable judgment. Aristotle (Poetics, viii) says Choerilus's comparisons far-fetched and obscure, and the Alexandrians distrusted him as Amphimachus in the canon of epic poets. The fragments are artificial in tone.

G. Kinkel, Epicerum Graecorum Fragmenta, i. (1877); for another view of his relations with Herodotus see Müller in Klio (1907), 29-44.

(3) An epic poet of Iassus in Caria, who lived in the 4th century B.C. He accompanied Alexander the Great on his campaigns as court-poet. He was well known from the passages in Horace (Epsiles, ii. 1, 232; Ars Poetica, 357), according to which he received a piece of gold for every good verse he wrote in celebration of the glorious deeds of his master. The quality of his verses may be estimated from the remark attributed to Alexander, that he would rather be the Thersites of Homer than an Achilles of Choerilus. The epitaph on Sardanapalus, said to have been translated from the Chaldean (quoted in Athenaeus, viii. p. 336), is generally supposed to be by Choerilus.

See G. Kinkel, Epicerum Graecorum Fragmenta, i. (1877); A. F. Níke, De Choerilii Samii Artista Vitae et Poesi usque ad Choerilus (1817), which also gives peripatetic index and judicious notes; and the articles in Pauly-Wissowa's Realencyclopadie, ii. 2 (1899).

CHOEROBOSCUS, GEORGII (c. A.D. 600), deacon and professor at the ecclesiastical school at Constantinople. He is also called charthophylax either as the holder of some ecclesiastical office or as superintendent of the university library. It is not known whether "Choeroboscus" (Gr. for "swineherd") is an allusion to his earlier occupation or an inherited family name. During his tenure of office he delivered a course of lectures on grammar, which has come down to us in the shape of notes taken by his pupils. He drew from the best authorities—Apollonius Dyscolus, Herodian, Orion, Theodosius of Alexandria. The lectures are written in simple style, but suffer from diffuseness. They were much used by Constantine Lascaris in his Greek grammar and by Urban of Belluno (end of 15th cent.). The chief work of Choeroboscus, which we have in its complete form, is the commentary on the canons of Theodosius on Decennial and Conjugation. Mention may also be made of a treatise on orthography, of which a fragment (on Quantity) has been preserved; a tract on prosody; commentaries on Hesychaeus and Dionysius Thrax; and grammatical notes on the Psalms.

See H. O. Schrader, Grundriss zur Kenntnis der griechischen Schriften (1857); A. Hilgard, Grammatistik Graecae, iv. (1889-1894), containing the text of the commentary on Theodosius, and a full account of the life and writings of Choeroboscus; N. Kohn in Pauly-Wissowa’s Realencyclopadie, ii. 2 (1899); Reitzenstein, Elymasogloko, 190, n. 4.

CHOR (O. Fr. cuer from Lat. chorus; pronounced quiere, and until the end of the 17th century so spelt, the spelling being altered to agree with the Fr. chœur), the body of singers who perform the musical portion of the service in a church, or the place set apart for them. Any organized body of singers performing full part choral works or-oratories is also called a choir.

In English cathedrals the choir is composed of men (vicars or lay clerks) and boys (choristers). They are divided into two sets, sitting on the north and south sides of the chancel respectively, called cantoris and decani, from being on the same side as the cantor (precentor) or the decanus (dean). This arrangement, together with the custom of vesting choirmen and choristers in surplices (traditional only in cathedrals and collegiate churches), has, since the middle of the 19th century, been adopted in a large number of parish and other churches. Surpliced choirs of women have occasionally been introduced, notably in America and the British colonies, but the practice has no warrant of traditional usage. In the Roman Catholic Church the choir plays a less conspicuous rôle than in the Church of England, its members not being regarded as ministers of the church, and non-Catholics are allowed to sing in it. The singers at Mass or other solemn services are usually placed in a gallery or some other inconspicuous place. The word "choir," indeed, formerly applied to all the clergy taking part in services of the church, and the restriction of the term to the singing men and boys, who were in their origin no more than the representatives

260 CHODOWIECKI—CHOIR
office at the court of Louis XIV., became minister of state in 1763, and in November 1665 was created duc de Choiseul. He was concerned in some of the negotiations between Louis and Charles II. of England which led to the treaty of Dover, and died in Paris on the 23rd of December 1765.

**CHOISEUL, ÉTIENNE FRANÇOIS, DUC DE (1719-1785),** French statesman, was the eldest son of François Joseph de Choiseul, marquis de Stainville (1700-1770), and bore in early life the title of comte de Stainville. Born on the 28th of June 1719, he entered the army, and during the War of the Austrian Succession served in Bohemia in 1741 and in Italy, where he distinguished himself at the battle of Coni, in 1744. From 1745 until 1748 he was with the army in the Low Countries, being present at the sieges of Mons, Charleroi and Maestricht. He attained the rank of lieutenant-general, and in 1750 married Louise Honorine, daughter of Louis François Crozat, marquis du Châtel (d. 1750), who brought her husband a large fortune and proved a most devoted wife.

Choiseul gained the favour of Madame de Pompadour by procuring for her some letters which Louis XV. had written to his cousin Madame de Choiseul, with whom the king had formerly had an intrigue; and after a short time as bailli of the Vosges he was given the appointment of ambassador to Rome in 1753, where he was entrusted with the negotiations concerning the disturbances called forth by the bull Unigenitus. He acquitted himself skilfully in this task, and in 1757 his patroness obtained his transfer to Vienna, where he was instructed to cement the new alliance between France and Austria. His success at Vienna opened the way to a larger career, when in 1758 he supplantied Antoine Louis Roulle (1689-1761) as minister for foreign affairs and so had the direction of French foreign policy during the Seven Years' War. At this time he was made a peer of France and created duc de Choiseul. Although from 1761 until 1766 his cousin César, duc de Choiseul-Praslin (1712-1783), was minister for foreign affairs, yet Choiseul continued to control the policy of France until 1770, and during this period held most of the other important offices of state.

As the author of the "Family Compact" he sought to retrieve by an alliance with the Bourbon house of Spain the disastrous results of the alliance with Austria; but his action came too late. His vigorous policy in other departments of state was not, however, fruitless. Coming to power in the midst of the demoralization consequent upon the defeats of Rossbach and Crefeld, by boldness and energy he reformed and strengthened both army and navy, and although too late to prevent the loss of Canada and India, he developed French colonies in the Antilles and Santo Domingo, and added Corsica and Lorraine to the crown of France. His management of home affairs in general satisfied the philosophes. He allowed the Encyclopedie to be published, and brought about the banishment of the Jesuits and the temporary abolition of the order by Pope Clement IV.

Choiseul's fall was caused by his action towards the Jesuits, and by his support of their opponent La Chalotais, and of the provincial parlements. After the death of Madame de Pompadour in 1764, his enemies, led by Madame Du Barry and the chancellor Maupou, were too strong for him, and in 1770 he was ordered to retire to his estate at Chanteloupe. The intrigues against him had, however, increased his popularity, which was already great, and during his retirement, which lasted until 1774, he lived in the greatest affluence and was visited by many eminent personages. Greatly to his disappointment Louis XVI. did not restore him to his former position, although the king recalled him to Paris in 1774, when he died on the 5th of May 1775. He died in his 58th year, leaving a huge accumulation of debt which was scrupulously discharged by his widow.

Choiseul possessed both ability and diligence, and though lacking in tenacity he showed foresight and liberality in his direction of affairs. In appearance he was a short, ill-featured man, with a ruddy countenance and a sturdy frame. His Mémoires were written during his exile from Paris, and are merely detached notes upon different questions. Horace Walpole, in his Memoirs, gives a very vivid description of the
CHOISEUL-STAINVILLE—CHOLERA

duke's character, accuses him of exciting the war between Russia and Turkey in 1768 in order to be revenged upon the tsarina Catherine II., and says of his foreign policy, "he would project and determine the ruin of a country, but could not meditate a little mischief for his own narrow benefit." "He dissipated the national wealth and his own; but did not repair the labours of the former," says the same writer, who in reference to Choiseul's private life asserts that "gallantry without duplicity was his constant pursuit." Choiseul's widow, a woman "in whom industrious malice could not find an imperfection," lived in retirement until her death on the 3rd of December 1808. See Mémoires du duc de Choiseul, edited by F. Calmettes (Paris, 1804); P. Bouthier, L'Ambassade de Choiseul à Vienne en 1757-1758 (Paris, 1872). Duc de Bernis, Mémoires (Paris, 1890); F. J. de P. Caro, de Bernis, Mémoires et lettres (Paris, 1878); Madame de Pompadour, Correspondance (Paris, 1878); Revue historique, tomes 82 and 87 (Paris, 1903-1905); Honour Walpole, Memoirs of the Reign of George III., edited by G. F. R. Barker (London, 1894); C. Mangros, Le duc et la duchesse de Choiseul: la Dignité du duc et de la duchesse de Choiseul (Paris, 1903); E. Calmettes, Choiseul et Voltaire (Paris, 1902); A. CHOISEUL-STAINVILLE, CLAUDE ANTOINE GABRIEL, DUC DE (1760-1838), French soldier, was brought up at Chanteloup, under the care of his relative, Étienne François, duc de Choiseul, who was childless. The outbreak of the Revolution found him a colonel of dragoons, and throughout those troublous times he was distinguished for his devotion to the royal house. He took part in the attempt of Louis XVI. to escape from Paris on the 20th of June 1791; was arrested with the king, and imprisoned. Liberated in May 1792, he emigrated in October, and fought in the "army of Condé" against the republic. Captured in 1795, he was confined at Dunkirk; escaped, set sail for India, was wrecked on the French coast, and condemned to death by the decree of the Directory. Nevertheless, he was fortunate enough to escape once more. Napoleon allowed him to return to France in 1801, but he remained in private life until the fall of the Empire. Of the Restoration in 1814, he was nominated a member of the provisional government; and he afterwards received from Louis Philippe the post of aide-de-camp to the king and governor of the Louvre. He died in Paris on the 1st of December 1838.

CHOISY, FRANÇOIS TIMOÎON, ABBÉ DE (1644-1724), French author, was born in Paris on the 16th of August 1644, and died in Paris on the 2nd of October 1724. His father was attached to the household of the duke of Orleans, and his mother, who was on intimate terms with Anne of Austria, was regularly called upon to amuse Louis XIV. By a whim of his mother, the boy was dressed like a girl until he was eighteen, and, after appearing for a short time in man's costume, he resumed woman's dress on the advice—doubtless satirical—of Madame de la Fare. He delighted in the most extravagant toilettes until he was publicly rebuked by the duc de Montausier, when he retired for some time to the provinces, using his disguise to assist his numerous intrigues. He had been made an abbé in his childhood, and poverty, induced by his extravagance, drove him to live on his benefice at Sainte-Sève in Burgundy, where he found among his neighbours a kindred spirit in Bussy-Rabutin. He visited Rome in the cardinal of Bouillon in 1706, and shortly after his return from a terrible illness brought about by a sudden fit of cholera and rather frivolous conversion to religion. In 1685 he accompanied the chevalier de Chaumont on a mission to Siam. He was ordained priest, and received various ecclesiastical preferments. He was admitted to the Academy in 1687, and wrote a number of historical and religious works, of which the most notable are the following:—Quatre dialogues sur l'immortalité de l'âme... (1684), written with the Abbé Dangeau and explaining his conversion; Traduction de l'Imitation de Jésus-Christ (1692); Histoire de France sous les règnes de Saint Louis... de Charles V et Charles VI (5 vols., 1688-1695); and Histoire de l'Église (11 vols., 1703-1723).

He is remembered, however, by his gossiping Mémoires (1737), which contain striking and accurate pictures of his time and remarkably exact portraits of his contemporaries, although he has otherwise small pretensions to historical accuracy.

The Mémoires passed through many editions, and were edited in 1877 by M. de Lescure. Some admirable letters of Choisy are included in the correspondence of Bussy-Rabutin. Choisy is said to have burnt some of his indiscreet revelations, but left a considerable quantity of unpublished MS. Part of this material, giving an account of his adventures as a woman, was surreptitiously used in an anonymous Histoire de madame la comtesse de la Roche (Antwerp, 1755), and again with much editing in the Vie de M. l'abbé de Choisy (Lausanne and Geneva, 1742), ascribed by Paul Lacroix to Lenslet Dufresny; the text was finally edited (1870) by Lacroix as Aventures de l'abbé de Choisy. See also Sainte-Beuve, Causeries du lundi, vol. iii.

CHOLERA (from the Gr. χολή, bile, and μέσος, to flow), the name given to two distinct forms of disease, simple cholera and malignant cholera. Although essentially different both as to their causation and their pathological relationships, these two diseases may in individual cases present many symptoms of mutual resemblance.

SIMPLE CHOLERA (synonyms, Cholera Europaea, British Cholera, Summer or Autumnal Cholera) is the cholera of ancient medical writers, as is apparent from the accurate description of the disease given by Hippocrates, Celsus and Aretæus. Its occurrence in an epidemic form was noticed by various physicians in the 16th century, and an admirable account of the disease was subsequently given by Thomas Sydenham in 1666-1672. This disease is sometimes called Cholera Nostras, the word nostras, which is good Latin and used by Cicero, meaning "belonging to our country." The relations between it and Asiatic cholera (see below) are obscure. Clinically they may exactly resemble each other, and bacteriology has not been able to draw an absolute line between them. The real difference is epidemiological, cholera nostras having no epidemic significance.

The chief symptoms in well-marked cases are vomiting and purging occurring either together or alternately. The seizure is usually sudden and violent. The contents of the stomach are first ejected, and this is followed by severe retching and vomiting of foul-smelling and bitter-tasting fluid. The diarrhoea which accompanies or succeeds the vomiting, and is likewise of bilious character, is attended with severe gripping abdominal pain, while cramps affecting the legs or arms greatly intensify the suffering. The effect upon the system is rapid and alarming, a few hours of such an attack sufficing to reduce the strongest person to a state of extreme prostration. The surface of the body becomes cold, the pulse weak, the voice husky, and the whole symptoms may resemble in a striking manner those of malignant cholera, to be subsequently described. In unfavourable cases, particularly where the disorder is epidemic, death may result within forty-eight hours. Generally, however, the attack is arrested and recovery soon follows, although there may remain for a considerable time a degree of irritability of the alimentary canal, rendering necessary the utmost care in regard to diet.

Attacks of this kind are of frequent occurrence in summer and autumn in almost all countries. They appear specially liable to occur when cold and damp alternate with heat. Occasionally the disorder prevails so extensively as to constitute an epidemic. The exciting causes of an attack are in many cases errors in diet, particularly the use of unripe fruit and new vegetables, and above all, excessive drinking of cold liquids during perspiration. On the other hand, the symptoms of this disorder in a household or community can sometimes be traced to the use of impure water, or to noxious emanations from the sewers.

In the treatment, vomiting should be encouraged so long as it shows the presence of undigested food, after which opiates ought to be administered. Small opium pills, or Dover's powder, or the aromatic powder of chalk with opium, are likely to be retained in the stomach, and will generally succeed in allaying the pain and diarrhoea, while ice and effervescing drinks serve
to quench the thirst and subdue the sickness. In aggravated cases where medicines are rejected, enemata of starch and laudanum, or the hypodermic injection of morphia, ought to be resorted to. Counter-irritation by mustard or turpentine over the abdomen is always of use, as is also friction with the hands where cramps are present. When sinking threatens, brandy and ammonia will be called for. During convalescence the food should be in the form of milk and farinaceous diet, or light soups, and all indigestible articles must be carefully avoided.

In the treatment of this disease as it affects young children (Cholera Infantum), most reliance is to be placed on the administration of chalk and the use of starch enemata. In their case opium in any form cannot be safely employed.

Malignant Cholera (synonyms, Asiatic Cholera, Indian Cholera, Epidemic Cholera, Alzide Cholera) is one of the most severe and fatal diseases. In describing the symptoms it is customary to divide them into three stages, but it must be noted that these do not always present themselves in so distinct a form as to be capable of separate recognition. The first or premonitory stage consists in the occurrence of diarrhoea. Frequently of mild and painless character, and coming on after some time, the patient will generally pass some watery stools or discharges from the bowels arc similar to those of ordinary summer cholera, which the attack closely resembles. There is, however, at first the absence of vomiting. This diarrhoea generally lasts for two or three days, and then if it does not gradually subside either may pass into the more severe phenomena characteristic of the second stage of cholera, or on the other hand may itself prove fatal.

The second stage is termed the stage of collapse or the algid or asphyxial stage. As above mentioned, this is often preceded by the premonitory diarrhoea, but not infrequently the phenomena attendant upon this stage are the first to manifest themselves. They come on often suddenly in the night with diarrhoea of the most violent character, the matters discharged being of whey-like appearance, and commonly termed the "rice-water" evacuations. They contain large quantities of disintegrated epithelium from the mucous membrane of the intestines. The discharge, which is at first unattended with pain, is soon succeeded by copious vomiting of matters similar to those passed from the bowels. The symptom is apt to be disregarded. The discharges from the bowels are similar to those of ordinary summer cholera, which the attack closely resembles. There is, however, at first the absence of vomiting. This diarrhoea generally lasts for two or three days, and then if it does not gradually subside either may pass into the more severe phenomena characteristic of the second stage of cholera, or on the other hand may itself prove fatal.

In this condition death often takes place in less than one day, but in epidemics cases are frequently observed where the collapse is so sudden and complete as to prove fatal in one or two hours even without any great amount of previous purging or vomiting. In most instances the mental faculties are comparatively unaffected, although in the later stages there is in general more or less apathy.

Reaction, however, may take place, and this constitutes the third stage. It consists in the arrest of the alarming symptoms characterizing the second stage, and the gradual but evident improvement in the patient's condition. The pulse returns, the surface assumes a natural hue, and the bodily heat is restored. Before long the vomiting ceases, and although diarrhoea may continue for a time, it is not of a very severe character and soon subsides, as do also the cramps. The urine may remain suppressed for some time, and on returning is often found to be albuminous. Even in this stage, however, the danger is not past, for relapses sometimes occur which speedily prove fatal, while again the reaction may be of imperfect character, and there may succeed an exhausting fever (the so-called typhoid stage of cholera) which may greatly retard recovery, and under which the patient may sink at a period even as late as two or three weeks from the commencement of the illness.

Many other complications are apt to arise during the progress of convalescence from cholera, such as diphteritic and local inflammatory affections, all of which are attended with grave danger.

When the attack of cholera is of milder character in all its stages than that above described, it has been named Cholerine, but the term is an arbitrary one and the disease is essentially cholera.

The bodies of persons dying of cholera are found to remain long warm, and the temperature may even rise after death. Peculiar muscular contractions have been observed to take place after death, so that the position of the limbs may become altered. The soft textures of the body are found to be dry and hard, and the muscles of a dark brown appearance. The blood is of dark colour and tarry consistence. The upper portion of the small intestines is generally found distended with the rice-water discharges, the mucous membrane is swollen, and there is a remarkable loss of its natural epithelium. The kidneys are usually in a state of acute congestion. This form of cholera has been originally to Asia, more particularly to India, where, as well as in the Indian archipelago, epidemics are known to have occurred at various times for several centuries.

Much light has been thrown upon Asiatic cholera by Western experience; and the study of the disease by modern methods has resulted in important additions to our previous knowledge of its nature, causation, mode of dissemination and prevention.

The cause is a micro-organism identified by Koch in 1883 (see Parasitic Diseases). For some years it was called the "comma bacillus," from its supposed resemblance in shape to a comma, but it was subsequently found to be a vibrio or spirillum, not a bacillus. The discovery was received with much scepticism in some quarters, and the claim of Koch's vibrio to be the true cause of cholera was long disputed, but is now universally acknowledged. Few micro-organisms have been more elaborately investigated, but very little is known of its natural history, and its epidemiological behaviour is still surrounded by obscurity. At an important discussion on the subject, held at the International Hygienic Congress in 1894, Professor Gentner of Vienna declared that the progress of the disease was the more difficult the problem became, while M. Elie Metchnikoff of the Pasteur Institute made a similar admission. The difficulty lies chiefly in the variable characters assumed by the organism and the variable effects produced by it. The type reached by cultivation through a few generations may differ so widely from the original in appearance and behaviour as to be hardly recognizable, while, on the other hand, of two organisms apparently indistinguishable one may be innocuous and the other give rise to the most violent cholera. This variability offers a possible explanation of the frequent failure to trace the origin of epidemic outbreaks in isolated places. It is commonly assumed that the micro-organism is of a specific character, and always introduced from without, when cholera appears in countries or places where it is not endemic. In some cases such introduction can be proved, and in others it can be inferred with a high degree of probability, but sometimes it is impossible to trace the origin to any possible channel of communication. A remarkable case of this kind occurred at the Nietleben lunatic asylum near Halle, in 1855, in the shape of a sudden, explosive and isolated outbreak of true Asiatic cholera. It was entirely confined to the institution, and the peculiar circumstances enabled a very exact investigation to be made. The facts led Professor Arndt, of Greifswald, to propound a novel and interesting theory. No cholera existed in the surrounding district and no introduction could be traced, but for several months in the previous autumn diarrhoea had prevailed in the asylum. The sewage from the establishment was disposed of on a farm, and the effluent passed into the river Saale above the intake of the water-supply for the asylum. Thus a circulation of morbific material through the persons of the inmates was established. Dr Arndt's theory was that by virtue of this circulation cholera was
gradually developed from previously existing intestinal disease of an allied but milder type. The outbreak occurred in winter, and coincided with the freezing of the filter-beds at the waterworks. The theory is worth notice, because a similar relation between the drainage and the water-supply frequently exists in places severely attacked by cholera, and it has repeatedly been observed that the latter is preceded by the prevalence of a milder form of intestinal disease. The inference is not that cholera can be developed de novo, but that the type is unstable, and that a virulent form may be evolved under favourable conditions from another so mild as to be unrecognized, and consequently undetected in its origin or introduction. This is quite in keeping with the observed variability of the micro-organism, and with the trend of modern research with regard to the relations between other pathogenic germs and the multifarious gradations of type assumed by other zymotic diseases.

The same thing has been suggested of diphtheria.

Cholera is endemic in the East over a wide area, ranging from Bombay to southern China, but its chief home is British India. It principally affects the alluvial soil near the mouths of the great rivers, and more particularly the delta of the Ganges. Lower Bengal is pre-eminently the standing focus and centre of diffusion. In some years it is quiescent, though never absent; in others it becomes diffused, for reasons of which nothing is known, and its diffusive activity varies greatly from equally inscrutable causes. At irregular intervals this property becomes so heightened that the disease passes its natural boundaries and is carried east, north and west, it may be to Europe or beyond to the American continent. We must assume that the micro-organism, like those of other epidemic diseases, acquires greater vitality and toxic energy, or greater power of reproduction at some times than at others, but the conditions that govern this behaviour are quite unknown, though no problem has a more important bearing on public health. Bacteriology, as already intimated, has thrown no light upon it, nor has meteorology. Some results of modern research, indeed, tend to assign increasing importance to the relations between surface soil and certain micro-organisms, and suggest that changes in the level of the subsoil water, to which Professor Max von Pettenkofer long ago drew attention, may be a dominant factor in determining the latency or activity of pathogenic germs. But this is largely a matter of conjecture, and, so far as cholera is concerned, the conditions which turn an endemic into an epidemic disease must be admitted to be still unknown.

On the other hand, the mode of dissemination is now well understood. Diffusion takes place along the lines of human intercourse. The poison is carried chiefly by infected persons moving from place to place; but soiled clothes, rags and other articles that have come into contact with persons suffering from the disease may be the means of conveyance to a distance. There is no reason to suppose that it is air-borne, or that atmospheric influences have anything to do with its spread, except in so far as meteorological conditions may be favourable to the growth and activity of the micro-organisms. Beyond all doubt, the great manufactury of the poison is the human body, and the discharges from it are the great source of contagion. They may infect the ground, the water, or the immediate surroundings of the patient, and so pass from hand to hand, the poison finding entrance into the bodies of the healthy by means of food and drink which have become contaminated in various ways. Flies which feed upon excreta and other foul matters may be carriers of contagion. Of all the means of local dissemination, contaminated water is by far the most important, because it affects the greatest number of people, and this is particularly the case in places which have a public water-supply. A single contaminated source may expose the entire population to danger. All severe outbreaks of an explosive character are due to this cause. It is also possible that the cholera poison multiplies rapidly in water under favourable conditions, and that a reservoir, for instance, may form a sort of forcing-bed. But it would be a mistake to regard cholera as purely a water-borne disease, even locally. It may infect the soil in localities which have a perfectly pure water-supply, but have defective drainage or no drainage at all, and then it will be found more difficult to get rid of, though less formidable in its effects, than when the water alone is the source of mischief. In all these respects it has a great affinity to enteric fever. With regard to locality, no situation can be said to be free from attack if the disease is introduced and the sanitary conditions are bad; but, speaking generally, low-lying places on alluvial soil near rivers are more liable than those standing high or on a rocky foundation. Of meteorological conditions it can only be said with certainty that a high temperature favours the development of cholera, though a low one does not prevent it. In temperate climates the summer months, and particularly August and September, are the season of its greatest activity.

Cholera spreads westwards from India by two routes—(1) by sea to the shores of the Red Sea, Egypt and the Mediterranean; and (2) by land to northern India and Afghanistan, thence to Persia and central Asia, and so to Russia. In the great invasions of Europe during the 19th century it sometimes followed one route and sometimes the other. It was not till 1817 that the attention of European physicians was specially directed to the disease by the outbreak of a violent epidemic of cholera at Jessore in Bengal. This was followed by its rapid spread over a large portion of British India, where it caused immense destruction of life both among natives and Europeans. During the next three years cholera continued to rage all over India, as well as in Ceylon and others of the Indian islands. The disease now began to spread over a wider extent than hitherto, invading China on the east and Persia on the west. In 1823 it had extended into Asia Minor and Russia in Asia, and it continued to advance steadily though slowly westwards, while at the same time fresh epidemics were appearing at intervals in India. From this period up till 1830 no great extension of cholera took place, but in the latter year it reappeared in Persia and along the shores of the Caspian Sea, and thence entered Russia in Europe. Despite the strictest sanitation, precautions, the disease spread rapidly through that whole empire, causing great mortality and exciting consternation everywhere. It ravaged the northern and central parts of Europe, and spread onwards to England, appearing in Sunderland in October 1831, and in London in January 1832, during which year it continued to prevail in most of the cities and large towns of Great Britain and Ireland. The disease subsequently extended into France, Spain and Italy, and crossing the Atlantic spread through North and Central America. It had previously prevailed in Arabia, Turkey, Egypt and the Nile district, and in 1833 it was general throughout North Africa. Up till 1837 cholera continued to break out in various parts of the continent of Europe, after which this epidemic disappeared, having thus within twenty years visited a large portion of the world.

About the year 1847 another great epidemic of cholera appeared in India and China, and soon began to extend in the direction traversed by the former, but involving a still wider area. It entered Europe again in 1847, and spread through Russia and Germany on to England, and thence to France, whence it passed to America, and subsequently appeared in the West Indies. This epidemic appears to have been even more deadly than the former, especially as regards Great Britain and France. A third great outbreak of cholera took place in the East in 1850, entering Europe in 1853. During the two succeeding years it prevailed extensively throughout the continent, and fell with severity on the armies engaged in the Crimean War. Although widely prevalent in Great Britain and Ireland it was less destructive than former epidemics. It was specially severe throughout both North and South America. A fourth epidemic visited Europe again in 1865-1866, but was on the whole less extensive and destructive than previous outbreaks.

By some writers the epidemic of 1853 is regarded as a recurrence of that of 1847. The earlier ones followed the land route by way of Afghanistan and Persia, and took several years to reach Europe. That of 1865 travelled more rapidly, being carried from Bombay by sea to Mecca, from there to Suez and Alexandria, and then on to various Mediterranean ports.
the year it had not only spread extensively in Europe, but had reached the West Indies. In 1866 it invaded England and the United States, but during the following year it died down in the West. The subsequent history of cholera in Europe may be stated chronologically.

1869-1874.—This invasion was traced to the great gathering of pilgrims at Hardwar on the Upper Ganges in the month of April 1867. From there the returning pilgrims carried it to the Punjab, Kashmir and Afghanistan, whence it spread to Persia and the Caspian, but it did not reach Russia until 1868. During the next four years a number of outbreaks occurred in central Europe, and notably one at Munich in the winter of 1873. The irregular character of these epidemics suggests that they were rather survivals from the pandemic wave of 1867 than fresh importations, but there is no doubt that cholera was carried overland into Russia in the manner described.

1873-1874.—This visitation, again, came by the Mediterranean. In 1873 a severe outbreak occurred in Egypt, causing a mortality of above 25,000. Its origin remained unknown. During this epidemic Koch discovered the comma bacillus. The following year cholera appeared in Toulon. It was said to have been brought in troopships from Saigon in Cochinchina, though it may have been connected with the Egyptian epidemic. A severe outbreak followed, and it reached Italy, nearly 8000 persons dying in Naples alone. In 1873 the south of France, Italy, Sicily and Spain all suffered, especially the last, where nearly 120,000 deaths occurred. Portugal escaped, and the authorities there attributed their good fortune to the institution of a military cordon, in which they had had implicit confidence ever since. In 1886 the same countries suffered again, and also Austria-Hungary. From Italy the disease was carried to South America, and even travelled as far as Chile, where it had previously been unknown. In 1877 it still lingered in the Mediterranean, causing great mortality in Messina especially. According to Dr A. J. Wall, this epidemic cost 250,000 lives in Europe and at least 50,000 in America. A particular interest attaches to it in the fact that a localized revial of the disease was caused in Spain in 1890 by the disturbance of the graves of some of the victims who had died of cholera four years previously.

1892-1893.—This great invasion reverted again to the old overland route, but the march of the disease was still unprecedented in rapidity. Within less than six months it travelled from the North-Western Provinces of India to St Petersburg, and probably to Hamburg, and thence in a few days to England and the United States. This speed, in such striking contrast to the slow advance of former occasions, was attributed, and no doubt rightly, to improved steam transit, and particularly the Transcaspian railway. The progress of the disease was traced from place to place, and almost from day to day, with great precision, showing how it moves along the chief highways and is obviously carried by man. The main facts are as follows:—Cholera was extensively and severely prevalent in India in 1891, causing 601,603 deaths, the highest mortality since 1877. In March 1892 it broke out at the Hardwar fair, a day or two before the pilgrims dispersed; on the 14th of April it was at Kabul, on the 1st of May at Herat, and on the 26th of May at Meshed. From Meshed it moved in three directions—due west to Teheran in Persia, north-east by the Transcaspian railway to Samarkand in Central Asia, and north-west by the same line in the opposite direction to Uzun-Ada on the Caspian Sea. It reached Uzun-Ada on the 6th of June, crossed to the Ural and Astrakhan, June 10th, to the Volga to Nizhny-Novgorod, arriving at Moscow and St Petersburg early in August. The part played by steam transit is clear from the fact that the disease took no longer to travel all the way from Meshed to St Petersburg by rail and steamboat than to traverse the short distance from Meshed to Teheran by road. On the 16th of August cases began to occur in Hamburg; on the 19th of August a fireman was taken ill at Grangemouth in Scotland, where he had arrived the day before from Hamburg; and on the 31st of August a vessel reached New York from the same port with cholera on board. On the 8th of September the disease appeared in Galicia, having moved somewhat slowly westwards across Russia into Poland, and on the 26th of September it was in Budapest. Holland and Servia were also attacked, while isolated cases were carried to Norway, Denmark and Italy. Meanwhile two entirely separate epidemics were in progress elsewhere. The first was confined to Arabia and the Somali coast of Africa, and was connected with the remains of an outbreak in Syria and Arabia in 1890-1891. The second arose mysteriously in France about the time that the overland invasion started from India. The first known case occurred in the prison at Nanterre, near Paris, on the 31st of March. Paris was affected in April, and Havre in July. The origin of this outbreak, which was of a much less violent character than that which came simultaneously by way of Russia, was never ascertained. Its activity was confined to France, particularly in the neighbourhood of Paris, together with Belgium and Holland, which was placed between two fires, but escaped with but little mortality. The number of persons killed by cholera in 1892, outside of India, was reckoned at 351,449, and the vast majority of those died within six months.

The countries which suffered most severely were as follows:—Europe, Russia, 151,636; Caspian, 60,131; Central Asia, 31,004; China, 13,502; Siberia, 13,502; total for Russia, 267,872; Persia, 63,982; Somaliland, 10,000; Afghanistan, 7,000; Germany, 9531; France, 4550; Hungary, 1255; Belgium, 961. Curiously enough, the south of Europe, which had been the scene of the previous epidemic visitation, escaped. The disease was of the most virulent character. In European Russia the mortality was 45.8% of the cases, the highest rate ever known in that country; in Germany it was 51.3%; and in Austria-Hungary, 57.5%. Of all the localities attacked, the case of Hamburg was the most remarkable. The presence of cholera was first suspected on the 16th of August, when two cases occurred, but it was officially declared until the 23rd of August. By that time the daily number of victims had already risen to some hundreds, while the experts and authorities were making up their minds whether they had cholera to deal with or not. Their decision eventually came too late and was superfluous, for by the 27th of August the people were being stricken down at the rate of 1000 a day. This rate was maintained for four days, after which the mortality of the pestilence, which had been 141.6 per 100,000, was reduced to 11.8. During these three months 16,956 persons were attacked and 8605 died, the majority within the space of a few weeks. The town, ordinarily one of the gayest places of business and pleasure on the continent, became a city of the dead. Thousands of persons fled, carrying the disease into all parts of Germany; the rest shut themselves indoors; the shops were closed, the trains ceased to run, the hotels and restaurants were deserted, and few vehicles or pedestrians were seen in the streets. At the cemetery, which lies about 10 m. from the town, some hundreds of men were engaged day and night digging long trenches to hold double rows of coffins, while the funerals formed an almost continuous procession along the roads; even so the victims could not be buried fast enough, and their bodies lay for days in sheds hastily run up as mortuaries. Hamburg had been attacked by cholera on fourteen previous occasions, beginning with 1831, but the mortality had never approached that of 1892; in the worst year, which was 1832, there were only 2687 cases and 1795 deaths. The disease was believed to have been introduced by Russian emigrants, and it was brought on their way from Russia, but the importation could not be traced. The Jews were segregated and kept under careful supervision from the middle of July onwards, and no recognized case occurred among them. The total number of places in Germany in which cholera appeared in 1892 was 269, but it took no serious hold anywhere save in Hamburg. The distribution was chiefly by the waterways, which seem to affect a larger number of places than the railways as carriers of cholera. In Paris 907 persons died, and in Havre 498. Between the 18th of August and the 21st of October 38 cases were imported into England and Scotland through eleven different ports, but the disease nowhere obtained a footing. Seven vessels brought 72 cases to the United States,
and 16 others occurred on shore, but there was no further dissemination.

During the winter of 1892–1893 cholera died down, but never wholly ceased in Russia, Germany, Austria-Hungary and France. With the return of warm weather it showed renewed activity, and prevailed extensively throughout Europe. The recorded mortality for the principal countries was as follows:—Russia (chiefly western provinces), 41,047; Austria-Hungary, 4660; France, 4000; Italy, 3036; Turkey, 1500; Germany, 208; Holland, 376; Belgium, 372; England, 139. Hardly any country escaped altogether; but Europe suffered less than Arabia, Mesopotamia and Persia. Cholera broke out at Mecca in June, and owing to the presence of an exceptionally large number of pilgrims caused an appalling mortality. The chief shore estimated the mortality at 50,000. The pilgrims carried the disease to Asia Minor and Constantinople. In Persia also a recrudescence took place and proved enormously destructive. Dr Barry estimated the mortality at 70,000. At Hamburg, where new waterworks had been installed with sand filtration, only a few sporadic cases occurred until the autumn, when a sudden but limited rush took place, which was traced to a defect in the reservoir permitting unfiltered Elbe water to pass into the mains. In England cholera obtained a footing on the Humber at Grimsby, and to a lesser extent at Hull, and isolated attacks occurred in some 50 different localities. Excluding a few ship-borne cases the registered number of attacks was 287, with 135 deaths, of which 9 took place in London. It is interesting to compare the mortality from cholera in England and Wales, and in London, for each year in which it has prevailed since registration began:

In 1894 no deaths from cholera were recorded in England, but on the continent it still prevailed over a wide area. In Russia over 30,000 persons died of it, in Germany about 500, but the most violent outbreak was in Galicia, where upwards of 8000 deaths were registered. In 1895 it still lingered, chiefly in Russia and Galicia, but with greatly diminished activity. In that year Egypt, Morocco and Japan were attacked, the last severely. The disease then remained in abeyance until the severe epidemic in India in 1900.

The great invasion just described was fruitful for lessons in the prevention of cholera. It proved that the one real and sufficient protection lies in a standing condition of good sanitation backed by an efficient and vigilant sanitary administration. The experience of Great Britain was a remarkable piece of evidence, that, but that Berlin was perhaps even more striking, for Berlin lay in the centre of four fires, in direct and frequent communication with Hamburg, Russia, France and Austria, and without the advantage of a sea frontier. Cholera was repeatedly brought into Berlin, but never obtained a footing, and its successful repression was accomplished without any irksome interference with traffic or the ordinary business of life. The general success of Great Britain and Germany in keeping cholera in check by ordinary sanitary means completed the conversion of all enlightened nations to the policy laid down so far back as 1865 by Sir John Simon, and advocated by Great Britain at a series of international congresses—the policy of abandoning quarantine, which Great Britain did in 1873, and trusting to sanitary measures with medical inspection of persons arriving from infected places. This principle was formally adopted at the international conference held at Dresden in 1893, at which a convention was signed by the delegates of Germany, Austria, Belgium, France, Great Britain, Italy, Russia, Switzerland, Luxembourg, Montenegro and the Netherlands. Under this instrument the practice is broadly as follows, though the procedure varies a good deal in different countries:—Ships arriving from infected ports are inspected, and if healthy are not detained, but bilge-water and drinking-water are evacuated, and persons landing may be placed under medical supervision without detention; infected ships are detained only for purposes of disinfection; persons suffering from cholera are removed to hospital; other persons landing from an infected ship are placed under medical observation, which may mean detention for five days from the last case, or, as in Great Britain, supervision in their own homes, for which purpose they give their names and places of destination before landing. All goods are freed from restrictions, except rags and articles believed to be contaminated by cholera matters. By land, passengers from infected places are similarly inspected at the frontiers and their luggage “disinfected”—in all cases a pious ceremony of no practical value, involving a short but often a vexatious delay; only those found suffering from cholera can be detained and disinfected. All streets and the greater part of the other places of the existence within its own borders of a “foyer” of cholera, by which is meant a focus or centre of infection. The precise interpretation of the term is left to each government, and is treated in a rather elastic fashion by some, but it is generally understood to imply the occurrence of non-imported cases in such a manner as to point to the local presence of infection. The question of guarding Europe generally from the danger of diffusion by pilgrims through the Red Sea was settled at another conference held in Paris in 1894. The provisions agreed on included the inspection of pilgrims at ports of departure, detention of infected or suspected persons, and supervision of pilgrim ships and of pilgrims proceeding overland to Mecca.

The substitution of the procedure above described for the old measures of quarantine and other still more drastic interferences with traffic presupposes the existence of a sanitary service and fairly good sanitary conditions if cholera is to be effectively prevented. No doubt if sanitation were perfect in any place or country, cholera, along with many other diseases, might there be ignored, but sanitation is imperfect everywhere, and therefore it requires to be supplemented by a system of notification with prompt segregation of the sick and destruction of infective material. These things imply a regular organization, and it is to the public health service of Great Britain that the complete mastery of cholera has mainly been due in recent years, and particularly in 1893. Of sanitary conditions the most important is unquestionably the water-supply. So many irrefragable proofs of this fact were given during 1892–1893 that it is no longer necessary to refer to the time-honoured case of the Broad Street pump. At Samarkand three regiments were encamped side by side on a level plain close to a stream of water. The colonel of one regiment took extraordinary precautions, placing a guard over the river, and compelling his men to use boiled water even for washing. Not a single case of cholera occurred in that regiment, while the others, in which only ordinary precautions were taken, lost over 100 men. At Askabad the cholera had almost disappeared, when a banquet was given in honour of the tsar’s name-day. Of the guests one-half died within twenty-four hours; a military band, which was present, lost 40 men out of 50; and one regiment lost half its men and 9 officers. Within forty-eight hours 1300 persons died out of a total population of about 13,000. The water supply came from a small stream, and just before the banquet a heavy rain-storm had occurred, which swept into the stream all surface refuse from an infected village higher up and some distance from the banks. But the classical example was Hamburg. The water-supply is obtained from the Elbe, which became infected by some means not ascertained. The drainage from the town also runs into the river, and the movement of the tide was sufficient to carry the sewage matter up above the water-intake. The water itself, which is no cleaner than that of the Thames
at London Bridge, underwent no purification whatever before distribution. It passed through a couple of ponds, supposed to act as settling tanks, but owing to the growth of the town and increased demand for water it was pumped through too rapidly to permit of any subsidence. Eels and other fish constantly found their way into the houses, while the mains were lined with vegetation and crustacea. The water-pipes of Hamburg had a peculiar and abundant fauna and flora of their own, and the water they delivered was commonly called Fleischbrühe, from its resemblance to thick soup. On the other hand, at Altona, which is contiguous with Hamburg, the water was filtered through sand. In all other respects the conditions were identical, yet in Altona only 328 persons died, against 860 in Hamburg. In some streets one side lies in Hamburg, the other in Altona, and cholera stopped at the dividing line, the Hamburg side being fully of cases and the Altona side untouched. In the following year, when Hamburg had the new filtered supply, it enjoyed equal immunity, save for a short period when, as we have said, raw Elbe water accidentally entered the mains.

But, though, the most important condition, is not the only one affecting the incidence of cholera. The case of Grimsby furnishes another telling lesson to the contrary. Here the disease obtained a decided hold, in spite of a pure water-supply through the fouling of the soil by cesspits and defective drainage at Havre also its prevalence was due to a similar cause. Further, it was conclusively proved at Grimsby that cholera can be spread by sewage-fed shell-fish. Several of the local outbreaks in England were traced to the ingestion of oysters obtained from the Grimsby beds. In short, it may be said that all insanitary conditions favour the prevalence of cholera in some degree. Preventive inoculation with an attenuated virus was introduced by W. M. W. Haffkine, and has been extensively used in India, with considerable appearance of success so far as the statistical evidence goes.

As already remarked, the latest manifestations of cholera show that it has lost none of its former virulence and fatality.

Treatment. The symptoms are now regarded as the effects of the toxic action of the poison formed by the micro-organisms upon the tissues and especially upon the nervous system. But this theory has not led to any effective treatment. Drugs in great variety were tried in the continental hospitals in 1849, but without any distinct success. The old controversy between the aperient and the astringent treatment reappeared. In Russia the former, which aims at evacuating the poison, was more generally adopted; in Germany the latter, which tries to conserve strength by stopping the flux, found more favour. Two methods of treatment were invariably found to give great relief, if not to prolong life and promote recovery—the hot bath and the injection of normal saline solution into the veins or the subcutaneous tissue. These two should always be tried in the cold and collapsed stages of cholera.

CHOLET, a town of western France, capital of an arrondissement in the department of Maine-et-Loire, 43 m. S.E. of Nantes on the Ouest-Etat railway between that town and Poitiers. Pop. (1900) 16,554. Cholets stands on an eminence on the right bank of the Maine, which is crossed by a bridge of the 15th century. A public garden occupies the site of the old castle; the public buildings and churches, the finest of which is Notre-Dame, are modern. The public institutions include the sub-prefecture, a tribunal of first instance, a chamber of commerce, a board of trade-arbitrators, and a communal college. There are granite quarries in the vicinity of the town. The chief industry is the manufacture of linen and linen handkerchiefs, which is also carried on in the neighbouring communes on a large scale. Woollen and cotton fabrics are also produced, and bleaching and the manufacture of preserved foods are carried on. Cholet is the most important centre in France for the sale of fat cattle, sheep and pigs, for which Paris is the chief market. Megalithic monuments are numerous in the neighbourhood. The town owes its rise to its prosperity to the settlement of weavers there by Edmond Colbert, count of Maulévrier, a brother of the great Colbert. It suffered severely in the War of La Vendée in 1793, insomuch that for years afterwards it was almost without inhabitants.

CHOLON ("great market"), a town of French Indo-China, the largest commercial centre of Cochinchina, 38 m. S.W. of Saigon, with which it is united by railway, steam-tramway and canal. Cholon was founded by Chinese immigrants about 1780, and is situated on the Chinese arroyo at the junction of the Lo-Gom and a canal. Its waterways are frequented by innumerable boats and lined in some places with native dwellings built on piles, in others by quays and houses of French construction. Its population is almost entirely Asiatic, and has more than trebled since 1830. In that year it had only 45,000 inhabitants; in 1907 it numbered about 138,000. Of these, 47,000 were Chinese, 73,000 Annamese, and 15,5 French (exclusive of a garrison of 92); the remainder consisted of Cambodians and Asiatic foreigners. During the rice season the town is visited by a large migration of rice-farmers. The Chinese are divided into congregations according to their place of origin. Cholon is administered by a municipal council, composed of French, Annamese and Chinese traders. An administrator of native affairs, nominated by the governor, fills the office of mayor. There are a fine municipal hospital and municipal schools for boys and girls. The principal thoroughfares are lighted by electric light. The rice trade, almost monopolized by the Chinese, is the leading industry, the rice being treated in large steam mills. Tanning, dyeing, copper-foundling, glass, brick and pottery manufacture, stone working, timber-sawing and junk building are also included among the industries.

CHOLONES, a tribe of South American Indians living on the left bank of the Huallaga river in the Amazon valley. The name is that given them by the Spanish. They were first met by the Franciscans, who established mission villages among them in 1676. They are a wild race but mild-mannered, very superstitious, and pride themselves on their skill as doctors. Their chief weapon is the blow-pipe, in the use of which they are adept. They are the most eventful in the annals of the tribe. They are the most eventful in the annals of the tribe.

CHOLON, an ancient town of Mexico, in the state and on the plateau of Puebla, 8 m. by rail W. by N. of the city of that name, and 6912 ft. above sea-level. Pop. (1900, estimate) 9000. The Inter-oceanic railway passes through Choluten, but the city's commercial and industrial standing is overshadowed by that of its larger and more modern neighbour. At the time of the Spanish Conquest, Choluten—then known as Cholulan—was a large and important town, consecrated to the worship of the god Quetzalcoatl, who had here one of the most imposing temples in Anahuac, built on the summit of a truncated pyramid, the largest of its kind in the world. This pyramid, constructed of sun-dried bricks and earth, 177 ft. high, and covering an area of nearly 45 acres, is the most conspicuous object in the town and is surmounted by a chapel dedicated to Nuestra Senora de los Remedios. A corner of the lower terrace of this great pyramid was cut through in the construction of the Puebla road, but nothing was discovered to explain its purpose, which was probably that of an imposing temple. Nothing definite is known of its age and history, as the fanatical zeal of Cortez and his companions destroyed whatever historical data the temple may have contained. Cholula was visited by Cortez in 1519 during his eventful march inland to Montezuma's capital, Tenochtitlan, where he treacherously massacred its inhabitants and pillaged the city, pretending to distruct the hospitable inhabitants. Cortez estimated that the town then had 20,000 inhabitants, and its suburbs as many more, but this was undoubtedly a deliberate exaggeration. The Cholutens were of Nahua or origin and were semi-independent, yielding only a nominal allegiance to Montezuma. They were a trading people, holding fairs, and exchanging their manufactures of textiles and pottery for other produce. The pyramid is believed
to have been built by a people occupying this region before the Cholulans.

**Chopin, Frederic François (1810–1849),** Polish musical composer and pianist, was born at Zelazowa-Wola, near Warsaw, on the 22nd of February 1810 (not the 1st of March 1809). His father, of French origin, born at Nancy in 1770, had married a Polish lady, Justine Krzyzanowska. Frederic was their third child. His first musical education he received from Adalbert Ziwny, a Czech musician, who is said to have been a passionate admirer of J. S. Bach. He also received a good general education at one of the first colleges of Warsaw, where he was supported by Prince Antoine Radziwiłł, a generous protector of artistic talent and himself well known as the composer of music to Goethe’s *Parsifal* and other works. His musical genius opened to Chopin the best circles of Polish society, at that time unrivaled in Europe for its ease of intercourse, the beauty and grace of its women, and its liberal appreciation of artistic gifts. These early impressions were of lasting influence on Chopin’s development. While at college he received thorough instruction in the theory of his art from Joseph Elsner, a learned musician and director of the conservatoire at Warsaw. When in 1829 he left his native town for Vienna, where his début as a pianist took place, he was in all respects a perfectly formed and developed artist. There is in his compositions little of that gradual progress which, for instance, in Beethoven necessitates a classification of his works according to different periods. Chopin’s individuality and his style were distinctly pronounced in that set of variations on “La ci darem” which excited the wondering enthusiasm of Robert Schumann. In 1831 he left Vienna with the intention of visiting London; but on his way to England he reached Paris and settled there for the rest of his life. Here again he soon became the favourite and musical hero of society. His connexion with Madame Dudevant, better known by her literary pseudonym of George Sand (q.v.), is an important feature of Chopin’s life. When in 1839 his health began to fail, George Sand went with him to Majorca, and it was mainly owing to her tender care that the composer recovered his health for a time. Chopin declared that the destruction of his relations with Madame Dudevant in 1847 broke up his life. The association of these two artists has provoked a whole literature on the nature of their relations, of which the novelist’s *Un Hiver à Majorque* was the beginning. The last ten years of Chopin’s life were a continual struggle with the pulmonary disease to which he succumbed in Paris on the 17th of October 1849. The year before his death he visited England, where he was received with enthusiasm by his numerous admirers. Chopin died in the arms of his sister, who fastened from Poland to his death-bed. He was buried in the cemetery of Père Lachaise. A small monument was erected to the memory of the composer at Wassswan in 1880. Portraits and medallions of Chopin were executed by Ary Scheffer and Eugène Delacroix, and by the sculptors Barry and Clésinger.

A distinguished English amateur thus records his impressions of Chopin’s style of pianoforte-playing compared with those of other masters. “His technical characteristics may be broadly indicated as negation of bravura, absolute perfection of finger-play, and of the *legatissimo* touch, on which no other pianist has ever so entirely relied, to the exclusion of that high relief and point which the modern German school, after the examples of Liszt and Thalberg, has so effectually developed. It is in these features that we must recognize that Grundverschiedenheit (fundamental difference) which according to Mendelssohn distinguished Chopin’s playing from that of these masters, and in no less degree from the example and teaching of Moscheles. . . . Imagine a delicate man of extreme refinement of mien and manner, sitting at the piano and playing with no sway of the body and scarcely any movement of the arms, depending entirely upon his narrow feminine hands and slender fingers. The wide arpeggios in the left hand, maintained in a continuous stream of tone by the strict legato and fine and constant use of the damper-pedal, formed an harmonious substructure for a wonderfully poetic cantabile. His delicate pianissimo, the ever-changing modifications of tone and time (tempo rubato) were of indescribable effect. Even in energetic passages he scarcely ever exceeded an ordinary mezzo-forte. His playing was a whole as unique in its kind, and no traditions of it exist, for there is no school of pianists, for the obvious reason that he could never be regarded as a public performer, and his best pupils were nearly all amateurs.”

In looking through the list of his compositions, teeming with mazurkas, valses, polonaises, and other forms of national dance music, one could hardly suppose that here one of the most melancholy natures has revealed itself. This seeming paradox is solved by the type of Chopin’s nationality, of which it has justly been said that its very dances are sadness intensified. But notwithstanding this strongly pronounced national type of his compositions, his music is always expressive of his individual feelings and sufferings to a degree rarely met with in the annals of the art. He is indeed the lyrical composer par excellence of the modern school, and the intensity of his expression finds its equal in literature only in the songs of Heinrich Heine, to whom Chopin has been justly compared. A sensation of such high-strung passion cannot be prolonged. Here we see that the shorter forms of music, the nocturne and mazurka, besides the national dances already alluded to, are chosen by Chopin in his groups. Even in the larger forms he treats the larger forms of the concerto or the sonata this concentrated, not so pointed, character of Chopin’s style becomes obvious. The more extended dimensions seem to encumber the freedom of his movements. The concerto for pianoforte with accompaniment of the orchestra in E may be instance. Here the adagio takes the form of a romance, and in the final rondo the rhythm of a Polish dance becomes recognizable while the instrumentation throughout is meagre and wanting in colour. Chopin is out of his element, and even the beauty of his melodies and harmonies cannot wholly banish the impression of incongruity. Fortunately he himself knew the limits of his power, and with very few exceptions his works belong to that class of minor compositions of which he was an unrivalled master. Barring a collection of Polish songs, two concertos, and a very small number of concerted pieces of chamber music, almost all his works are written for the pianoforte solo; the symphony, the concerto, the opera, he never attempted.

Chopin’s works group themselves first into the period from Op. 1 to 22, which includes nearly all his attempts at large or classical forms, e.g. the works with orchestra, Op. 2 (variations on La ci darem); Op. 11 and 14 (concertos); Op. 13 (Polish fantasia); Op. 14 (Krzakwa); Op. 15 (Polonaise); Op. 12 (Andante spianato and Polonaise); besides the solo rondos Op. 1, 5, 16, and the variations Op. 12 and the essays in chamber music Op. 3, 8, 65. Meanwhile, however, the mature lyric style of his
dances and valses, which already began with Op. 6 (4 mazurkas), and through which it is not confined to small forms, the larger mature works (beginning with the ballade Op. 23 and excepting only the sonata Op. 58 and the Allegro de Concert Op. 46) are as independent of tradition as the small early works, and, as regards their absolutely great fantasy Op. 49 and the impromptus Op. 29, 36, 51.

The posthumous works number 35 pieces, besides a small number of songs a few of which are of great interest. Not unworthy of mention is Chopin’s life and art (F. Chopin, par F. Liszt, Paris, 1851), and a very appreciative though somewhat eccentric appreciation of his work appeared anonymously in 1842 (An Essay on the Works of Frédéric Chopin, London). The standard biography is the English one by Nathaniel Harned, published in 1888. See also W. Hadow, *Studies in Modern Music*, second series (1908). The editions of Chopin’s works by his pupil Mikuli and by Klindworth are full of valuable elucidation as to methods of performance, but unfortunately they do not distinguish the commentary from the text. The critical edition published by Breitkopf and Härtel, with all its mistakes, is absolutely necessary for students who wish to know what Chopin wished to put into the hands of players of independent judgment.
CHOPSTICKS, the "pidgin-English" name for the pair of small tapering sticks used by the Chinese and Japanese in eating. "Chop" is 'pidgin-English for "quick," the Chinese word for the articles being 菜一意, meaning "the quick ones." "Chopsticks" are commonly made of wood, bone or ivory, somewhat longer and slightly thinner than a lead-pencil. Held between the thumb and fingers of the right hand, they are used as tongs to take up portions of the food, which is brought to table cut up into small and convenient pieces, or as means for sweeping the rice and small particles of food into the mouth from the bowl. Many rules of etiquette govern the proper conduct of the chopsticks; laying them across the bowl is a sign that the guest wishes to leave the table; they are not used during a time of mourning, when food is eaten with the fingers; and various methods of handling them form a secret code of signalling.

CHORAGUS (the Lat. form of Gr. χοραγός or χοργύς, leader of the chorus), the citizen chosen to undertake the expense of furnishing and instructing the chorus at the Dionysiac festivals at Athens (see LITURGY and FINANCE). The name is given to an assistant to the professor of music at the university of Oxford, whose office was combined, with that of the professor, in 1626 by Dr William Heather.

CHORALE (from the Lat. choralis, sc. cantus; the final e is added to show the Ger. pronunciation choräls), a term in music used by English writers to indicate the hymn-tunes composed or adopted for use in church by the German reformers. German writers, however, apply the terms "Choral" and "Chorale-gesang," as Luther himself would apply them, to any solemn melody used in church. It is thus the equivalent of canto fermo; and the German rhymed versions of the biblical and other ancient canticles, such as the Magnificat and the Te Deum, are set to curious corruptions of the corresponding Gregorian tunes, which adaptations of the composers of classical German music called chorales with no more scruple than they applied the name to tunes of secular origin, German or foreign. The peculiarity of German chorale-music, however, is that its use, and consequently much of its invention, not only arose in connexion with the Reformation, by which the liturgy of the church became "understood of the people," but also that it belongs to a musical epoch in which symmetry of melody and rhythm was beginning to assume artistic importance. The growing sense of form shown by some of Luther's own tunes (e.g. Von Himmel hoch, da komm' ich her) so advanced, especially in the tunes of Crüger, beyond any that was shown by folk-music; and it provided an invaluable bulwark against the effect that was threatening to swamp music on all sides at the beginning of the 17th century. By Bach's time all the polyphonic instrumental and vocal art-forms of the 18th century were mature; and though he loved to derive the design as well as the details of a large movement from the shape of the chorale tune on which it was based, he became quite independent of any aid from symmetry in the tune as raw material. The chorus of his cantata Jesus nun sei gesprieset is one of the most perfectly designed and quite the longest of movements ever based upon a chorale, and it is one of the most intractable in the world, though its most unpromising portion is the basis of the most impressive feature in Bach's design (the slow middle section in triple time).

The national character of the German chorale, and the recent great development of interest in folk-music, together with the unique importance of Bach's work, have combined to tempt writers on music to over-estimate the distinctiveness of the art-forms based upon the German chorale. There is really nothing in these art-forms which is not continuous with the universal practice of writing counterpoint on a canto fermo. And it should never be forgotten that, however fascinating may be the study of the relation between artistic forms and the spirit of the age, no art can successfully express more of the spirit of the age than its own technical resources will admit. Choral music in all ages has tended to consist largely of counterpoint on a canto fermo (see CONTRAPUNTAL FORMS). Where there are not many canto fermo in constant use in the church, composers will be driven to use them rather unsystematically as special effects, and to rely for the most part on other artistic devices, though any use of melodies in long notes against quicker counterpoint will be aesthetically indistinguishable from counterpoint compounded from them. Thus Handel in his Italian and English works wrote no entire chorales to his own text, yet what is the passage in the "Hallelujah" chorus from 'the king of this world' to the end but a treatment of the second part of the chorale Wacht auf? How shall we describe the treatment of the words "And their cry came up unto the Lord" in the first chorus of Israel in Egypt, except as the treatment of a phrase of chorale or canto fermo? Again, to return to the 16th century, what are the hymns of Palestina but figured chorales? In what way, except in the lack of symmetry in the Gregorian phrasing, do they differ from the contemporary setting by Orlando di Lasso, also a Roman Catholic, of the German chorale Vater unser im Himmelreich? In modern times the use of German chorales, as in Mendelssohn's oratorios and organ-sonatas, has had rather the aspect of a revival than of a development; though the technique and spirit of Brahms's posthumous organ chorale-preludes is thoroughly modern and vital.

The most interesting of all the English adaptations of the German chorale is, perhaps, the translation of the originally earliest collection of "Chorale" is that made by Luther and Johann Walther (1508—1570), the Enchiridion, published in 1524. Next in importance we place the Genevan Psalter (1st ed., Strassburg, 1542, final edition 1550) which is now considered as the model of Bourgeois. From this Sternhold and Hopkins borrowed extensively (1562). The psalter of C. Goudimel (Paris, 1565) is another among many prominent collections showing the steps towards congregational singing, i.e. the restriction to "note-against-note" counterpoint (sc. plain harmony), and, in twelve cases, the assigning of the melody to the treble instead of to the tenor. The first hymn-book in which this latter step was acted on throughout is Osier's Geistliche Lieder... also gesetzt, dass ein christliche Gemein durchaus mislingen kann (1566). But many of the finest and most famous tunes are of much later origin than any such collections. Several (e.g. Ich freue mich in dir) cannot be traced before Bach, and were very probably composed by him. (D. F. T.)

CHORIAMBIC VERSE or CHORIAMBICS, the name given to Greek or Latin lyrical poetry in which the sound of the choriambus predominates. The choriambus is a verse-foot consisting of a trochee united with and preceding an iambus, "—", ——. The choriambic verse is never used alone, but are usually preceded by a spondee and followed by an iambus. The line so formed is called an asclepiad, traditionally because it was invented by the Aeolian poet Asclepiades of Samos. Choriambic verse was first used by the poets of the Greek islands, and Sappho, in particular, produced magnificent effects with it. The measure, as used by the early Greeks, is essentially lyrical and impassioned. Mingled with other metres, it was constantly serviceable in choral writing, to which it was believed to give a stormy and mysterious character. The greater Asclepiad was a term used for a line in which the wild music was prolonged by the introduction of a supplementary choriambus. This was much employed by Sappho and by Alcaeus, as well as in Alexandrian times by Callimachus and Theocritus. Among the Latins, Horace, in imitation of Alcaeus, made common use of choriambic verse. Metrical experts distinguish six different varieties of it in the Odes. This is an example of his greater asclepiad (Od. i. 11):

Tu ne | quaeueris | scire nefas | quem mihi | quem | tibi
Finem | Di deditur | Leuconoei | nec Babylonios
Te matris numeros | neglegit erit | pate
Seu plures hienes, | seu tribuit | Jupiter ultimus,
Quae nunc | oppositis | debilitat | punicibus | mare
Tyrrhenum.

In later times of Rome, both Seneca and Prudentius wrote choriambic verse with a fair amount of success. Swinburne even introduced it into English poetry:

Love that would not be outlived | life that was made | lovely, we | thought | with love.
What sweet | vision of sleep | lured thee away | down from the light | above.
Such lines as these make a brave attempt to resuscitate the measured sound of the greater asclepiad.

(E. G.)

CHORICIUS, of Gaza, Greek sophist and rhetorician, flourished in the time of Anastasius I. (A.D. 491—518). He was the pupil
CHORIN—CHORUS

of Procopius of Gaza, who must be distinguished from Procopius of Caesarea, the historian. A number of his declarations and descriptive treatises have been preserved. The declarations, which are in many cases accompanied by explanatory commentaries, chiefly consist of panegyric, funeral orations and the stock themes of the rhetorical schools. The Εὐπλαθάμοι or wedding speeches, wishing prosperity to the bride and bridegroom, strike out a new line. Choricius was also the author of so-called Έκκλησίαι, descriptions of works of art after the manner of Philostratus. The moral maxims, which were a constant feature of his writings, were largely drawn upon by Macarius Chrysocephalus, metropolitan of Philadelphia (middle of the 14th century), in his Rodonias (rose-garden), a voluminous collection of ethical sayings. The style of Choricius is praised by Photius as pure and elegant, but he is censured for lack of naturalness. A special feature of his style is the persistent avoidance of hiatus, peculiar to what is called the school of Gaza.

Editions by J. F. Boissonade (1846, supplemented by C. Graux in Revue de philologie, 1877) and R. Förster (1882-1894); see also C. Kirsten, "Quaestiones Chorianae in Breslauer philologische Abhandlungen, vii. (1894), and article by W. Schmid in Pauly-Wissowa's Realencycloepädie, iii. 2 (1890). On the Gaza school see K. Seitz, Die Schule von Gaza (Heidelberg, 1899).

CHORIN, AARON (1769-1844), Hungarian rabbi and pioneer of religious reform. He favoured the use of the organ and of prayers in the vernacular, and was instrumental in establishing schools on modern lines. Chorin was thus regarded as a leader of the newer Jewish. He also interested himself in public affairs; and his son Francis was a Hungarian deputy.

See L. Löw, Gesammelte Schriften, ii. 251.

CHORIZONTES ("selectors"); the name given to the Alexandrian critics who denied the single authorship of the Iliad and Odyssey, and held that the latter poem was the work of a later poet. The most important of them were the grammarians Xeno and Hellanicus; Aristarchus was their chief opponent (see Homer).

CHORLEY, HENRY FOTHERGILL (1808-1872), English musical critic, one of an old Lancashire family, began in a merchant's office, but soon took to musical journalism. He began to write for the Athenæum in 1830, and remained its musical critic for more than a generation; and he also became musical critic for The Times. In these positions he had much influence; he had strong views, and was a persistent opponent of innovation. In addition to musical criticism, he wrote voluminously on literature and art, besides novels, dramas and verse, and various librettos; and he published several books, including Modern German Music (1854), Handel Studies (1859), and Thirty Years' Musical Recollections (1862). He died in London on the 16th of February 1872.

CHORLEY, a market town and municipal borough in the Chorley parliamentary division of Lancashire, England, on the river Yarrow, 202 m. N.W. from Manchester, on the Lancashire & Yorkshire and London & North-Western railways and the Leeds & Liverpool Canal. Pop. (1801) 23,687; (1901) 26,832. The church of St Lawrence is of Perpendicular and earlier date, largely restored; it contains fine woodwork and some interesting monuments. Cotton spinning and the manufacturing of cotton and muslin are extensively carried on, and there are also iron and brass foundries and boiler factories. Railway-wagon building is an important industry. The district contains a number of coal-mines and stone- quarries. Close to the town is the beautiful Elizabethan mansion of Astley Hall, which is said to have sheltered Oliver Cromwell after the battle of Preston (1648). The corporation consists of a mayor, 6 aldermen and 24 councillors. Area, 3614 acres.

CHORLU, SCHORLAVI, or SCHORLAVI, a town of European Turkey, in the vilayet of Adrianople; on the left bank of the Chorlu, a small left-hand tributary of the Erzene, 20 m. N.E. of Rodosto. Pop. (1905) about 12,000, of whom one-half are Greeks, one-third Turks, and the remainder Armenians and Jews. Chorlu has a station on the Constantinople-Adrianople branch of the Oriental railways. It manufactures woolen cloth (stotjas) and native carpets, and exports cereals, oil-cloth, carpets, cattle, poultry, fresh meat, game, fruits, wine, alcohol, hides and bones.

CHOROGRAPHY. (1) (From the Gr. χώρα, a tract of country, and γράφειν, to write), a description or delineation on a map of a district or tract of country; it is to be distinguished from "geography" and "topography," which treat of the earth as a whole and of particular places respectively. The word is common in old geographical treatises, but is now superseded by the wider use of "topography." (2) (From the Gr. χώρος, space), the art of dancing, or a system of notation to indicate the steps and movements in dancing.

CHORUM, the chief town of a sanjak of the Angora vilayet in Asia Minor, altitude 2300 ft., situated on the edge of a wide plain, almost equidistant from Amasia and Yuzgat. Pop. about 12,500, including a few Christians. Its importance is largely due to the trade on the great trade-route from Kaisareh (Caesarea) by Yuzgat and Marzivan to Samarcand. It corresponds to the ancient Euchatta, which lay 15 m. E. Euchait was attacked by the Huns A.D. 508, and became a bishopric at an early period and a centre of religious enthusiasm, as containing the tomb of the revered St Theodore, who slew a dragon in the vicinity and became one of the great warrior saints of the Greek Church. Something of the old enthusiasm seems to have passed to the inhabitants of Chorum, whom most travellers have found bigoted and fanatical Mohammedans (see J.B. Anderson, Studia Pontica, pp. 108).
CHOSE—CHOSROES 271

vocem emitit." Several illuminated MSS.\(^1\) from the 9th to the
11th century give fanciful drawings, accompanied by descriptions in
barbarous Latin, evidently meant to illustrate those described in
the letter to Dardanus. The original MS., probably an
illustrated transcript of this letter, which served as a copy for the
others, was apparently produced at a time when the Roman
bagpipe (tibia utricularia) had fallen into disuse in common with
other musical instruments, and was unknown except to the few.
The Latin description given above is correct and quite unmistakable
to any one who knows the primitive form of bagpipe; the
illustrations must therefore represent the effort of an artist to depict
an unknown instrument from a description. Virdung, Luscinius
and Praetorius seem to have had access to a MS. of the Dardanus
letter now lost, and to have reproduced the drawings without
understanding them. In a MS. of the 14th century at the British
Museum,\(^2\) containing a chronicle of the world's history to
the death of King Edward I., the chorus is mentioned and described
in similar words to those quoted above; in the margin is an
elementary sketch of a primitive bagpipe with blowpipe and
chamber with three holes, but no drone. Bagpipes with drones
abound on sculptured monuments and in miniatures of that
date. Gerbert gives illustrations of the fanciful chorus from the
10th century, and of two other instruments of later date.
One of these represents a musician playing the Platertspiel, the
other the bagpipe known as cheverette, in which the whole skin of
the animal (a kid or pig), with head and feet, has been used for the
bag. Edward Buhle,\(^3\) in his admirable work on the musical
instruments in the illuminated MSS. of the middle ages, points out
that Gerbert,\(^4\) who gives the dates of his two MSS. as "6th and
9th centuries," has a singular method of reckoning the date of
MS.; he refers to the age of a MS. at the time of writing
(18th century), not to the date at which it was produced.
The MS. containing the two figures of musicians mentioned above,
instead of being ascribed to the 6th century, was six centuries
old when Gerbert wrote in 1774, and dates therefore from the
12th century. It is interesting to note that GiralduS Cambrensis\(^5\)
mentions the chorus as one of the three instruments of Wales
and Scotland, ascribing superior musical skill to the latter.
Historians record that King James I. of Scotland was renowned
for his skill as a performer on various musical instruments, one
of which was the chorus. This bears out the traditional belief
that the bagpipe and the Scottish attribute from the earliest
times. The word "chorus" was at first used or applied to
medieval poems with other instruments, but without indication
as to the kind of instrument thus designated. The word was
probably the French equivalent for the Platertspiel.

See also G. Kastner, Danses des morts (pp. 200 to 202, pl. xv.,
No. 103); and Dom Pedro Cerone, El Melopeo y maestro (Naples,
1613), p. 248. (K.S.)

CHOSE (Fr. for "thing"), a term used in English law in
different senses. *Chose local* is a thing annexed to a place, as a
mill. A *chose transitory* is that which is movable, and can be
carried from place to place. But the use of the word "chose"
in these senses is practically obsolete, and it is now used only
in the phrase "choses in action," which is applied to actions
"in action," sometimes called a chose in suspense, in its more
limited meaning, denotes the right of enforcing by legal
procurement the payment of a debt, or the obtaining money by
way of damages for breach of contract, or as a recompense for a
wrong. Less accurately, the money itself which could be
recovered is frequently termed a chose in action, as is also
sometimes the document evidencing a title to a chose in action,
such as a bond or a policy of insurance, though strictly it is only
the right to recover the money which can be so termed. Choses
in action were, before the Judicature Acts, either legal or equitable.
Where the chose could be recovered only by an action at law
as a debt (whether arising from contract or tort), it was termed
a legal chose in action; where the chose was recoverable only
by a suit in equity, as a legacy or money held upon a trust, it
was termed an equitable chose in action. Before the Judicature
Act, a legal chose in action was not assignable, i.e. the assignee
could not sue at law in his own name. To this rule there were
two exceptions:—(1) the crown has always been able to assign
chooses in action which are certain, such as an ascertained debt,
but not those that are uncertain; (2) assignments valid by
operation of law, e.g. on marriage, death or bankruptcy.
On the other hand, however, by the law merchant, which is part
of the law of England, and which disregards the rules of common
law, bills of exchange were freely assignable. The consequence
was that, with these and certain statutory exceptions (e.g.
the assignees on policies of insurance), an action on an assigned
chose in action must have been brought in the name of the
assignor, though the sum recovered belonged exclusively to
the assignee. All choses in action being in equity assignable,
except those which are altogether incapable of being assigned.
in equity the assignee might have sued in his own name, making
the assignor a party as co-plaintiff or as defendant. The Judicature
Acts made the distinction between legal and equitable
chooses in action of no importance. The Judicature Act of 1873,
s. 25 (6), enacted that the legal right to a debt or other legal
chose in action could be passed by absolute assignment in
writing under the hand of the assignor.

"Chose in possession" is opposed to chose in action, and
denotes not only the right to enjoy or possess a thing, but also
the actual or constructive enjoyment of it. The possession
may be absolute or qualified. It is absolute when the person is
fully and completely the proprietor or owner of the thing; it is
qualified when he "has not an exclusive right, or not a permanent
right, but a right which may sometimes subsist and at
other times not subsist," as in the case of animals fere naturae.
Choses in possession are not transferable by delivery. Previ-
ously to the Married Women's Property Act (1882), a wife's
chose in possession vested in her husband immediately on
her marriage, while her choses in action did not belong to the
husband until he had reduced them into possession, but this
difference is now practically obsolete.

CHOSROES, in Middle and Modern Persian Khorrau ("with
a good name"), a very common Persian name, borne by a famous
king of the Iranian legend (Kai Khosrau); by a Persian king,
commonly called by the Greeks Osroes (q.v.); and by the following
two Sassanid kings.

1. CHOSROES I., "the Blessed" (Amsishravan), 351—379, the
favourite son and successor of Kavadh I., and the most famous
of the Sassanid kings. At the beginning of his reign he
concluded an "eternal" peace with the emperor Justinian, who wanted
to have his hands free for the conquest of Africa and Sicily. But
his successes against the Vandals and Goths caused Chosroes
to begin the war again in 540. He invaded Syria and carried
the inhabitants of Antioch to his residence, where he built for them
a new city near Ctesiphon under the name of Khosrau-Antioch
or Chosro-Antioch. During the next years he fought successfully
in Lazica (Lazistan and Lazistan the ancient Colchis, r.), on the
Black Sea, and in Mesopotamia. The Romans, though led by Belliarius,
could do little against him. In 545 an armistice was concluded,
but in Lazica the war went on till 556. At last, in 562, a peace
was concluded for 50 years, in which the Persians left Lazistan
to the Romans, and promised not to persecute the Christians,
if they did not attempt to make proselytes among the Zara-
thrustrians; on the other hand, the Romans had again to pay
CHOTA NAGPUR—CHOUANS

subsidies to Persia. Meanwhile in the east the Hephthalites had been attacked by the Turks, who now appear for the first time in history. Chosroes united with them and conquered Bactria, while he left the country north of the Oxus to the Turks. Many other rebellious tribes were subjected. About 570 the dynasts of Yemen, who had been subdued by the Ethiopians of Axum, applied to Chosroes for help. He sent a fleet with a small army under Vahriz, who expelled the Ethiopians. From that time till the conquests of Mahomet, Yemen was dependent on Persia, and a Persian governor resided here. In 571 a new war with Rome broke out about Armenia, in which Chosroes conquered the fortress Dara on the Euphrates, invaded Syria and Cappadocia, and returned with large booty. During the negotiations with the emperor Tiberius Chosroes died in 579, and was succeeded by his son Hormizd IV.

Although Chosroes had in the last years of his father extirpated the heretical and communistic Persian sect of the Mazdakites (see Kavadhi) and was a sincere adherent of Zoroastrian orthodoxy, he was not fanatical or prone to persecution. He tolerated every Christian confession. When one of his sons had rebelled about 550 and was taken prisoner, he did not execute him; nor did he punish the Christians who had supported him. He introduced a rational system of taxation, based upon a survey of landed possessions, which the scholar had begun, and led away taxes for the welfare and the revenues of his empire. In Babylonia he built or restored the canals. His army was in discipline decidedly superior to the Romans, and apparently was well paid. He was also interested in literature and philosophical discussions. Under his reign chess was introduced from India, and the famous book of Kalilah and Dimnah was translated. He thus became renowned as a wise prince. When Justinian in 529 closed the university of Athens, the last seat of paganism in the Roman empire, the last seven teachers of Neoplatonism emigrated to Persia. But they soon found out that neither Chosroes nor his state corresponded to the Platonic ideal, and Chosroes, in his treaty with Justinian, stipulated that they should return un molested.

2. CHOSROES II. "the Victorious" (Parvez), son of Hormizd IV., grandson of Chosroes I., 590-628. He was raised to the throne by the magnates who had rebelled against Hormizd IV. in 590, and soon after his father was blinded and killed. But at the same time the general Bahram Chobin had proclaimed himself king, and Chosroes II. was not able to maintain himself. The war with the Romans raged for another twenty years, and Chosroes fled to Syria, and persuaded the emperor Maurice to send help. Many leading men and part of the troops acknowledged Chosroes, and in 618 he was brought back to Ctesiphon. Bahram Chobin was beaten and fled to the Turks, among whom he was murdered. Peace with Rome was then concluded. Maurice made no use of his advantages; he merely restored the former frontier and abolished the subsides which had formerly been paid to the Persians. Chosroes II. was much inferior to his grandfather. He was haughty and cruel, rapacious and given to luxury; he was neither a general nor an administrator. At the beginning of his reign he favoured the Christians; but when in 602 Maurice had been murdered by Phocas, he began war with Rome to avenge his death. His armies plundered Syria and Asia Minor, and in 608 advanced to Chalcedon. In 613 and 614 Damascus and Jerusalem were taken by the general Shahrbarz, and the Holy Cross was carried away in triumph. Soon after, even Egypt was conquered. The Romans could offer but little resistance, as they were torn by internal dissensions, and pressed by the Avars and Slavs. At last, in 622, the emperor Heraclius (who had been succeeded by Phocas in 610) was able to take the field. In 624 he advanced into the northern Media, where he destroyed the great fire-temple of Gandzak (Gazaca); in 626 he fought in Lazistan (Colchis), while Shahrbarz advanced to Chalcedon, and tried in vain, united with the Avars, to conquer Constantinople. In 627 Heraclius defeated the Persian army at Nineveh and advanced towards Ctesiphon. Chosroes fled from his favourite residence, Dastagerd (near Bagdad), without offering resistance, and as his despotism and indulgence had roused opposition everywhere, his eldest son, Kavadh II., whom he had imprisoned, was set free by some of the leading men and proclaimed king. Four days afterwards, Chosroes was murdered in his palace (February 628). Meanwhile, Heraclius returned in triumph to Constantinople, in 629 the Cross was given back to him and Egypt evacuated, while the Persian empire, from the apparent greatness: which it had reached ten years ago, sank into hopeless anarchy.

See PERSIA: Ancient History. For the Roman wars see authorities quoted under MAURICE and HERACLIUS. (Ed. M.)

CHOTA (or CHUTTA) NAGPUR, a division of British India in Bengal, consisting of five British districts and two feudatory states. It is a hilly, forest-clad plateau, inhabited mostly by aboriginal races, between the basins of the Sone, the Ganges and the Mahanadi. The five British districts are Hazaribagh, Ranchi, Palamau, Manbhum and Singhbhum. The total area of the British districts is 27,101 sq. m. The population in 1901 was 4,900,426. The tributary states are noticed separately below. The Chota Nagpur plateau is an offshoot of the great Vindyan range, and its mean elevation is upwards of 2,000 ft. above the sea-level. In the W. it rises to 3,000 ft., and to the E. and S. its lower steppe, from 800 to 1000 ft. in elevation, comprises a great portion of the Manbhum and Singhbhum districts. The plateau is about 14,000 sq. m. in extent, and forms the source of the Bhumia, Basar, Subanrekha, Turka and other rivers. It has a barren and closed surface, with large hills and small valleys. The climate is tropical, with hot summers and cold winters. The vegetation is arborescent, with large forests of teak, sal and other hardy trees. The principal crops are rice, sugarcane, cotton, tobacco, and many other agricultural products. The people are divided into many tribes, of whom the Nag, Kho, Thoda, etc. are the most important. The climate of Chota Nagpur is dry and healthy. The Jherra extension branch of the East India railway runs to Katrasgarh, while the Bengal-Nagpur railway also serves the division.

The CHOTA NAGPUR STATES were formerly nine in number. But the five states of Charg Bhakar, Korca, Sirgura, Udaipur and Jashpur were transferred from Bengal to the Central Provinces in October 1905, and the two Uriya-speaking states of Gangpur and Bonai were attached to the Orissa Tributary States. There remain now, therefore, only the two states of Khasawam and Sariaka. At the decline of the Mahatta power in the early part of the 19th century, the Chota Nagpur states came under British protection. Before the rise of the British power in India their chiefs exercised almost absolute sovereignty in their respective territories.

CHOUANS (a Bas-Breton word meaning screech-owls), the name applied to smugglers and dealers in contraband salt, who rose in insurrection in the west of France at the time of the Revolution and joined the royalists of La Vendée. It has been suggested that the name arose from the cry they used when approaching their nocturnal rendezvous; but it is more probable that it was derived from a nickname applied to their leader Jean Cottereau (1767-1794). Originally a contraband manufacturer of salt, Cottereau along with his brothers had several times been
condemned and served sentence; but the Revolution, by destroying the inland customs, ruined his trade. On the 15th of August 1792, he led a band of peasants to prevent the departure of the volunteers of St Ouen, near Laval, and retired to the wood of Misslon, where they lived in huts and subterranean chambers. The Chouans then waged a guerrilla warfare against the republicans and, sustained by the royalists and from abroad, carried on their assassinations and brigandage with success. From Lower Maine the insurrection soon spread to Brittany, and throughout the west of France. In 1793 Cottereau came to Laval with some 500 men; the band grew rapidly and swelled into a considerable army, which assumed the name of La Petite Vendée. But after the decisive defeats at Le Mans and Savenay, Cottereau retired again to his old haunts in the wood of Misslon, and resumed his old course of guerrilla warfare. Misfortunes here increased upon him, until he fell into an ambuscade and was mortally wounded. He died among his followers in February 1794. Cottereau's brothers also perished in the war, with the exception of René, who lived until 1846. Royalist authors have made of Cottereau a hero and martyr, titles to which his claim is not established. After the death of Cottereau, the chief leaders of the Chouans were Georges Cadoudal (q.v.) and a man who went by the name of Jambe d'Argent. For several months the Chouans continued their petty warfare, which was disgraced by many acts of ferocity and rapine; in August 1795 they dispersed; but there were guilty of several conspiracies until 1815. (See also VENDÉE.)

CHROMESGRAPHION—CHRIM (273)

CHROMESGRAPHION (from Gr. χρυσός, oracular, and γράφω, to write), an architectural term sometimes given to the chamber between the porches and the cella in Greek temples where oracles were delivered.

CHRISTEN, FLORENT (1541-1596), French satirist and Latin poet, the son of Guillaume Christen, an eminent French physician and writer on physiology, was born at Orleans on the 26th of January 1541. A pupil of Henri Estienne, the Hellenist, at an early age he was appointed tutor to Henry of Navarre, afterwards Henry IV., who made him his librarian. Brought up as a Calvinist, he became a convert to Catholicism. He was the author of many good translations from the Greek into Latin verse,—amongst others, of versions of the Hero and Leander attributed to Musaeus, and of many epigrams from the Anthology. In his translations into French, among which are remarked those of Buchanan's Jëphthith (1567), and of Oppian De Venatione (1575), he is not so happy, being rather to be praised for fidelity to his original than for excellence of style. His principal claim to a place among memorable satirists is as one of the authors of the Satyre Mësippe, the famous pasquinade in the interest of his old pupil, Henry IV., in which the hangman puts into the mouth of a cardinal de Pelvë is usually attributed to him. He died on the 3rd of October 1596, at St-Dominge.

CHRISTIAN, or CHERSTEN, DE TROYES, native of Champagne, and the most famous of French medieval poets. Unfortunately we have few exact details as to his life, and opinion differs as to the precise dates to be assigned to his poems. We know that he wrote the Chevalier de la Charrette at the command of Marie, countess of Champagne (the daughter of Louis VII. and Eleanor, who married the count of Champagne in 1164), and Le Conte de la Grail or Perceval for Philip, count of Flanders, who died of the plague before Acre in 1191. This prince was guardian to the young king, Philip Augustus, and held the regency from 1180 to 1182. As Christen refers to the story of the Grail as the best tale told au cort royal, it seems very probable that it was composed during the period of the count's regency. It was left unfinished, and added to at divers times by at least three writers, Wauchier de Denain, Gerbert de Montreuil and Manessier. The second of these states definitely that Christen died before he could finish his work. Probably it is his literary activity lies between the dates 1150 and 1182, when his patron, Count Philip, fell into disgrace at court. The extant poems of Chrétien de Troyes, in their chronological order are, Érec et Énide, Chïges, Le Chevalier de la Charrette (or Lancelot), Le Chevalier au Lion (or Yvain), and Le Conte del Graal (Perceval), all dealing with Arthurian legend. Besides these he states in the opening lines of Chïges that he had composed a Tristan (of which so far no trace has been found), and had made certain translations from Ovid's Ars Amatoria and Metamorphoses. A portion of the last has been found by Gaston Paris included in the translation of Ovid made by Chrétien Legouais. There exists also a poem, Guillaume d'Angleterre, purporting to be by Chrétien, but the authorship is a matter of debate. Professor Foerster claims it as genuine, and includes it in his edition of the poems, but Gaston Paris never accepted it.

Chrétien's poems enjoyed widespread favour, and of the three most popular (Érec, Yvain and Perceval) there exist old Norse translations, while the two first were admirably rendered into German by Hartmann von Aue. There is an English translation of the Yvain, Faunus (1310), and there are Welsh versions of all three, though the work of Allanfaeth is not considered to be determined. Chrétien's style is easy and graceful, such as might be expected from a court poet; he is analytical, but not dramatic; in depth of thought and power of characterization he is decidedly inferior to Wolfram von Eschenbach, and as a poet he is probably to be ranked below Thomas, the author of the Tristan, and the translator of Thomas, Gottfried von Strassburg. Much that has been claimed as characteristic of his work has been shown by M. Willmore to be merely reproductions of literary conceits employed by his predecessors; in the words of a recent writer, M. Bédier, "Chrétien semble moins avoir été un créateur épique qu'un habile arrangeur." The special interest of his poems lies in the problems surrounding their origin. So far as the MSS. are concerned they are the earliest Arthurian romances we possess. Did Chrétien invent the genre, or did he simply turn to account the work of earlier, and less favoured, poets? Round this point the battle still rages hotly, and though the extensive claims made by the enthusiastic editor of his works are gradually yielding to the force of critical investigation, it cannot be said that the question is in any way settled. (See also CHRISTIAN.)

Chretien's poems, except the Perceval, have been critically edited by Professor Foerster (4 vols.). There is no easily available edition of the Perceval, which was printed from the Mons MS. by M. Potvin (6 vols., 1866-1871), but is difficult to procure. For Yvain and Tristan see edition by Schuch (1887; 1897); for Perceval the German versions are in Deutsche Classiker des Mittelalters, 1888 (Yvain), 1893 (Érec); the Welsh, in Lady Charlotte Guest's translation of the Mabarnogion (Nutt, 1902); Scandinavian translations, ed. K. Kjöling (1872). For general criticism see Willmore, L'Évolution du roman français aux environs de 1150 (1903); also Legend of Sir Lancelot and Legend of Sir Perceval (Grimm Library); and M. Borodine, La Femme et l'amour au XIIe siècle, d'après les poèmes de Chrétien de Troyes (1909).

CHRIS (through Lat. chrisma, from Gr. χρισμα, an anointing substance, χριστός, to anoint; through a Romano form cresma comes the Fr. chrétien "believer"; the Latin word was used for anointing in the Roman Catholic church in baptism, confirmation and ordination, and in the consecrating and blessing of altars, chalices, baptismal water, &c. The consecration of the "chrism" is performed by a bishop, and since the 5th century this function has been taken place on Maundy Thursday. In the Orthodox Church the chrism contains, besides olive oil, many precious spices and perfumes, and is known as "muron" or "myron." The word is sometimes used loosely for the unmixed olive oil used in the sacrament of extreme unction. The "Chrisom" or "chrysum," a variant of "chrism," lengthened through pronunciation, is a white cloth with which the head of a newly baptized child was covered to prevent the holy oil from being rubbed off. If the baby died within a month of its baptism, it was shrouded in its chrisom; otherwise the cloth or its value was given to the church as an offering by the mother at her churching. Children dying within the month were called

---

---
“christian-children” or “chrismos,” and up to 1726 such entries occur in bills of mortality. The word was also used generally for a very young and innocent child, thus Shakespeare, *Henry V.*, ii, 3, says of Falstaff: “A made a finer end and went away an it had been any Christos Child.”

CHRIST (Gr. Χριστός, Anointed), the official title given in the New Testament to Jesus of Nazareth, equivalent to the Hebrew Messiah. See Jesus Christ; Messiah; Christianity.

CHRIST, WILHELM VON (1831–1906), German classical scholar, was born in Geisenheim in Hesse-Nassau on the 2nd of August 1831. From 1845 till 1860 he taught in the Maximiliansgymnasium at Munich, and in 1861 he was appointed professor of classical philology in the university. His most important works are his *Geschichte der griechischen Literatur* (5th ed., 1908 f.), a history of Greek literature down to the time of Justinian, one of the best works on the subject; *Matrik der Griechen und Römer* (1876); editions of Pindar (1887); of the *Poetica* (1878) and *Metaphysics* (1893) of Aristotle; *Hid did* (1884). His contributions to the *Sitzungsberichte* and *Abhandlungen* of the Bavarian Academy of Sciences are particularly valuable.

See O. Crissius, *Gedächtnissrede* (Munich, 1907).

CHRISTADELPHIANS (Χριστιάνοι Ἐδεξωθα, “brothers of Christ”), sometimes also called Thomasites, a community founded in 1836 by John Thomas (1805–1872), who, having studied medicine in London, migrated to Brooklyn, N.Y., U.S.A. There he at first joined the “Campbellites,” but afterwards struck out independently, preaching largely upon the subject of religious liberty and the Book of Revelation to current and future events. Both in America and in Great Britain he gathered a number of adherents, and formed a community which has been extended to several English-speaking countries. It consists of exclusive “ecclesias,” with neither ministry nor organization. The members meet on Sundays to “break bread” and discuss the Bible. Their theology is strongly millenarian, centering in the hope of a world-wide theocracy with its seat at Jerusalem. Holding a doctrine of “conditional immortality,” they believe that alone have the true exegesis of Scripture, and that the “faith of Christendom” is compounded of the fables predicted by Paul. No statistics of the community are published. It probably numbers from two to three thousand members. A monthly magazine, *The Christadelphian*, is published in Birmingham.

See R. Roberts, *Dr Thomas, His Life and Work* (1884).

CHRISTCHURCH, a municipal and parliamentary borough of Hampshire, England, at the confluence of the rivers Avon and Stour, 13 m. from the sea, and 104 m. S.W. by W. from London by the London & South Western Railway. Pop. (1901) 42,045. It is famous for its magnificent priory church of the Holy Trinity. The church is cruciform, lacking a central tower, but having a Perpendicular tower at the west end. The nave and transepts are principally Norman, and very fine; the choir is Perpendicular. Early English additions appear in the nave, clerestory and elsewhere, and the rood-screen is of ornate Decorated workmanship. Other noteworthy features are the Norman turret at the north-east angle of the north transept, covered with arcading and other ornament, the beautiful reredos, similar to that in Winchester cathedral, and several interesting monuments, among which is one to the poet Shelley. Only fragments remain of the old castle, but an interesting ruin adjoins it known as the Norman House, apparently dating from the later part of the 13th century. Hosiery, and chains for clocks and watches are manufactured, and the salmon fishery is valuable. There is a small harbour, but it is dry at low water. The parliamentary borough, returning one member, includes the town of Bournemouth. The municipal borough is under a mayor, 4 aldermen and 12 councillors. Area, 635 acres.

Christchurch is mentioned in Saxon documents under the name of Twaynearn or Tewinnaeth, which long survived in the form Christchurch Twineham. In 901 it was seized by Aethelwald, but was recaptured by Edward the Elder. In the Domesday Survey, under the name of Thuanum, it appears as a royal manor, comprising a mill and part of the king's forest; its value since the time of Edward the Confessor had decreased by almost one-half. Henry I. granted Christchurch to Richard de Redvers, who erected the castle. The first charter was granted by Baldwin earl of Exeter in the 12th century; it exempted the burgesses from certain tolls and customs, including the tolls on salt within the borough, and the custody of thieves. The 2nd Earl Baldwin granted to the burgesses the tolls of the fair at St Faith and common of pasture in certain meads. The above charters were confirmed by Edward II., Henry VII. and Elizabeth. The Holy Trinity fair is mentioned in 1226. Christchurch was governed by a bailiff in the 13th century, and was not incorporated till 1670, when the government was vested in a mayor and 24 capital burgesses, but this charter was shortly abandoned. The borough was summoned to send representatives to parliament in 1507 and 1508, but no returns are registered until 1572, from which date it was represented by two members until the Reform Act of 1832 reduced the number to one. The secular canons of the church of Holy Trinity held valuable possessions in Hampshire at the time of Edward the Confessor, including a portion of Christchurch, and in 1150 the establishment was constituted a priory of regular canons of St Augustine. Baldwin de Redvers confirmed the canons in their right to the first salmon caught every year and the tolls of Trinity fair. The priory, which attained to such fame that its name of Christchurch finally replaced the older name of Twineham, was dissolved in 1539.

CHRISTCHURCH, a city near the east coast of South Island, New Zealand, to the north of Banks Peninsula, in Selwyn county, the capital of the provincial district of Canterbury and the seat of a bishop. Pop. (1906) 49,928; including suburbs, 67,878. It stands upon the great Canterbury plain, which here is a dead level, though the monotony of the site has been much relieved by extensive plantations of English and Australian trees. A background is supplied by the distant mountains to the west, and by the nearer hills to the south. The small river Avon winds through the city, pleasantly bordered by terraces and gardens. The wide streets cross one another for the most part at right angles. The predominance of stone and brick as building materials, the dominating cathedral spire, and the well-planted parks, avenues and private gardens, recall the aspect of an English residential town. Christchurch is mainly dependent on the rich agricultural district which surrounds it, the plain being mainly devoted to cereals and grazing. Wool is extensively worked for local and foreign export. Railways connect with Culverden to the north and with Dunedin and the south coast, with many branches through the agricultural districts; also with Lyttelton, the port of Christchurch, 8 m. S.E. There are tramways in the city, and to New Brighton, a seaside suburb, and other residential quarters. The principal public buildings are the government buildings and the museum, with its fine collection of remains of the extinct bird, moa. The cathedral is the best in New Zealand, built from designs of Sir G. Gilbert Scott in Early English style, with a tower and spire 240 ft. high. Among educational foundations are Canterbury College (for classics, science, engineering, &c.), Christ's College (mainly theological) and grammar school, and a school of art. There is a Roman Catholic pre-cathedral attached to a convent of the Sacred Heart. A large extent of open ground, to the west of the town, finely planted, and traversed by the river, comprises Hagley Park, recreation grounds, the Government Domain and the grounds of the Acclimatization Society, with fish-ponds and a small zoological garden. The foundation of Christchurch is connected with the so-called “Canterbury Pilgrims,” who settled in this district in 1850. Lyttelton was the original settlement, but the town of Christchurch came into existence in 1851, and is thus the latest of the settlements of the colony. It became a municipality in 1862. In 1903 several populous suburban boroughs were amalgamated with the city.

CHRISTIAN II. (1481–1559), king of Denmark. Norway and Sweden, son of John (Hans) and Christina of Saxony, was
CHRISTIAN II.

born at Nyborg castle in 1481, and succeeded his father as king of Denmark and Norway in 1513. As viceroy of Norway (1506-1528) he had already displayed a singular capacity for ruling under exceptionally difficult circumstances. Patriotism, insight, courage, statesmanship, energy—these great qualities were indisputably his; but unfortunately they were vitiated by obstinacy, suspicion and a sulky craftiness, beneath which simmered a very volcano of revengeful cruelty. Another peculiarity, more fatal to him in that aristocratic age than any other, was his fondness for the common people, which was increased by his passion for a pretty Dutch girl, named Dyveke, who became his mistress in 1507 or 1509.

Christian's succession to the throne was confirmed at the Herredag, or assembly of notables from the three northern kingdoms, which met at Copenhagen in 1513. The nobles and clergy of all three kingdoms regarded with grave misgivings a ruler who had already shown in Norway that he was not afraid of enforcing his authority to the uttermost. The Riisgraads of Denmark and Norway insisted, in the haastining or charter extorted from the king, that the crowns of both kingdoms were elective and not hereditary, the charter had to be transferred to the charter by the king, and expressly reserving to themselves a free choice of Christian's successor after his death. But the Swedish delegates could not be prevailed upon to accept Christian as king at all. "We have," they said, "the choice between peace at home and strife here, or peace here and civil war at home, and we prefer the former." A decision as to the Swedish succession was therefore postponed. On the 12th of August 1515 Christian married Isabella of Burgundy, the grand-daughter of the emperor Maximilian. But he would not give up his liaison with Dyveke, and it was only the death of the unfortunate girl in 1517, under suspicious circumstances, that prevented serious complications with the emperor Charles V. Christianavenge himself by executing the magnate Torben Oxe, who, on very creditable evidence, was supposed to have been Dyveke's murderer, despite the strenuous opposition of Oxe's fellow-peers; and henceforth the king lost no opportunity of depressing the nobility and raising plebeians to power. His chief counsellor was Dyveke's mother Sigbrit, a born administrator and a commercial genius of the first order. Christian at first appointed her controller of the Sound tolls, and ultimately committed to her the whole charge of the finances. A bourgeoise herself, it was Sigbrit's constant policy to elevate and extend the influence of the middle classes. She soon became the soul of a middle-class inner council, which competed with the Rigsraad itself. The patriots naturally resented their supersession and nearly every unpopular measure was attributed to the influence of "the foul-mouthed Dutch sorceress who hath bewitched the king."

Meanwhile Christian was preparing for the inevitable war with Sweden, where the patriotic party, headed by the freely elected governor Sten Sture the younger, stood face to face with the philo-Danish party under Archbishop Gustavus Trolle. Christian, who had already taken measures to isolate Sweden politically, hastened to the relief of the archbishop, who was beleaguered in his fortress of Stäke, but was defeated by Sture and his peasant levies at Veila and forced to return to Denmark. A second attempt to subdue Sweden in 1518 was also frustrated by Sture's victory at Bränkyrke. A third attempt in the 1520 with a large army of French, German and Scottish mercenaries proved successful. Sture was mortally wounded at the battle of Börgerund, on the 19th of January, and the Danish army, unpoppular, was approaching Upsala, where members of the Swedish Riisråd had already assembled. The senators consented to render homage to Christian on condition that he gave a full indemnity for the past and a guarantee that Sweden should be ruled according to Swedish laws and custom; and a convention to this effect was confirmed by the king and the Danish Riisråd on the 31st of March. But Sture's widow, Dame Christina Gyllenstjerna, still held out stoutly at Stockholm, and the peasantry of central Sweden, stimulated by her patriotism, flew to arms, defeated the Danish invaders at Balundsås (March 10th), and were only with the utmost difficulty finally defeated at the bloody battle of Upsala (Good Friday, April 6th). In May the Danish fleet arrived, and Stockholm was invested by land and sea; but Dame Christina resisted valiantly for four months longer, and took care, when she surrendered on the 7th of September, to exact beforehand an amnesty of the most explicit and absolute character. On the 1st of November the representatives of the nation swore fealty to Christian as hereditary king of Sweden, though the law of the land distinctly provided that the Swedish crown should be elective. On the 4th of November he was anointed by Gustavus Trolle in Stockholm cathedral, and took the usual oath to rule the realm through native-born Swedes alone, according to prescription. The next three days were given up to banqueting, but on the 7th of November "an entertainment of another sort began." On the evening of that day Christian summoned his captains to a private conference at the palace, the result of which was quickly apparent, for at dusk a band of Danish soldiers, with lanterns and torches, broke into the great hall and carried off several carefully selected persons. By 10 o'clock the same night the remaining members of Christian's government were safely under lock and key. All these persons had previously been marked down on Archbishop Trolle's proscription list. On the following day a council, presided over by Trolle, solemnly pronounced judgment of death on the proscribed, as manifest heretics. At 12 o'clock that night the patriotic bishops of Skara and Strängnäs were led out into the great square and beheaded. Fourteen noblemen, three burgomasters, fourteen town-councillors and about twenty common citizens of Stockholm were then drowned or decapitated. The executions continued throughout the following day; in all, about eighty-two people are said to have been thus murdered. Moreover, Christian revenged himself upon the dead as well as upon the living, for Sten Sture's body was dug up and burnt, as well as the body of his little child. Dame Christina and many other noble Swedish ladies were sent prisoners to Denmark. It has well been said that the manner of this atrocious deed (the "Stockholm Massacre" as it is generally called) was even more detestable than the deed itself. Christian suppressed his political opponents under the pretence of defending an ecclesiastical system which in his heart he despised. Even when it became necessary to make excuses for his action, we see the same double-mindedness. Thus, while in a proclamation to the Swedish people he represented the massacre as a measure necessary to avoid a papal interdict, in his apology to the pope for the decapitation of the innocent bishops he described it as an unauthorized act of vengeance on the part of his own people. It was with his brain teeming with great designs that Christian II. returned to his native kingdom. That the welfare of his dominions was dear to him there can be no doubt. Inhuman as he could be in his wrath, in principle he was as much a humanist as any of his most enlightened contemporaries. But he would do things his own way; and deeply distrusting the Danish nobles with whom he shared his powers, he sought helpers from among the wealthy and practical middle classes of Flanders. In June 1521 he paid a sudden visit to the Low Countries, and remained there for some months. He visited most of the large cities, took into his service many Flemish artisans, and made them his personal acquaintances. Quentin Matsys and Albrecht Dürer, the latter of whom he painted his portrait. Christian also entertained Erasmus, with whom he discussed the Reformation, and left fall the characteristic expression: "Mild measures are of no use; the remedies that give the whole body a good shaking are the best and surest."

Never had King Christian seemed so powerful as on his return to Denmark on the 5th of September 1521, and with the confidence of strength he at once proceeded recklessly to inaugurate the most sweeping reforms. Soon after his return he issued his great Lanodelo, or Code of Laws. For the most part this is founded on Dutch models, and testifies in a high degree to the king's progressive aims. Provision was made for the better education of the lower, and the restriction of the political influence of the higher clergy; there were stern prohibitions against
wreckers and "the evil and unchristian practice of selling peasants as if they were brute beasts "; the old trade gilds were retained, but the rules of admittance thereto made easier, and trade combinations of the richer burghers, to the detriment of the smaller tradesmen, were sternly forbidden. Unfortunately these reforms, excellent in themselves, suggested the standpoint not of an elected ruler, but of a monarch by right divine. Some of them were even in direct contravention of the charter; and the old Scandinavian spirit of independence was deeply wounded by the preference given to the Dutch. Sweden too was now in open revolt; and both Norway and Denmark were taxed to the uttermost to raise an army for the subjection of the sister kingdom. Foreign complications were now superadded to these domestic troubles. With the laudable object of releasing Danish trade from the grinding yoke of the Hansa, and making Copenhagen the great emporium of the north, Christian had arbitrarily raised the Sound tolls and seized a number of Dutch ships which presumed to evade the tax. Thus his relations with the Netherlands were strained, while with Lübeck and her allies he was openly at war. Finally Jutland rose against him, renounced its allegiance and offered the Danish crown to Duke Frederick of Holstein (January 20th, 1522). So his overwhelming difficulties appear that he took ship to seek help abroad, and on May 1st landed at Veere in Zealand. Eight years later (October 24th, 1531) he attempted to recover his kingdoms, but a tempest scattered his fleet off the Norwegian coast, and on the 1st of July 1532, by the convention of Oslo, he surrendered to his rival, King Frederick, and for the next 27 years was kept in solitary confinement, first in the Blue Tower at Copenhagen and afterwards at the castle of Kopenhanburg. He died in January 1559.

CHRISTIAN III. (1503-1539), king of Denmark and Norway, was the son of Frederick I. of Denmark and his first consort, Anne of Brandenburg. His earliest teacher, Wolfgang von Utenhof, who came straight from Wittenberg, and the Lutheran Holstheimer Johann Kantzau, who became his tutor, were both able and zealous reformers. In 1521 Christian travelled in Germany, and was present at the diet of Worms, where Luther's behaviour profoundly impressed him. On his return he found that his father had been elected king of Denmark in the place of Christian II., and the young prince's first public service was the reduction of Copenhagen, which stood firm for the fugitive Christian II. He made no secret of his Lutheran views, and his outspokenness brought him into collision, not only with the Catholic Rigsgaard, but also with his cautious and temporizing father. At his own court at Schleswig he did his best to introduce the Reformation, despite the opposition of the bishops. Both as stadtholder of the Duchies in 1526, and as viceroy of Norway in 1529, he displayed considerable administrative ability, though here too his religious intolerance greatly provoked the Catholic party. There was even some talk of passing him over in the succession to the throne, in favour of his half-brother Hans, who had been brought up in the old religion. On his father's death Christian was proclaimed king at the local diet of Viborg, and took an active part in the "Greven's Fejde" or "Count's War." The triumph of so fanatical a reformer as Christian brought about the fall of Catholicism, but the Catholics were still so strong in the council of state that Christian was forced to have recourse to a coup d'état, which he successfully accomplished by means of his German mercenaries (12th of August 1530), an absolutely inexusable act of violence loudly blamed by Luther himself, and accompanied by the wholesale spoliation of the church. Christian's finances were certainly readjusted thereby, but the ultimate gainers by the confiscation were the nobles, and both education and morality suffered grievously in consequence. The circumstances under which Christian III. ascended the throne naturally exposed Denmark to the danger of foreign domination. It was with the help of the gentry of the duchies that Christian had conquered Denmark. German and Holstein noblemen had led his armies and directed his diplomacy. Naturally, a mutual confidence between a king who had conquered his kingdom and a people who had stood in arms against him was not attainable immediately, and the first six years of Christian III.'s reign were marked by a contest between the Danish Rigsgaard and the German counsellors, both of whom sought to rule "the pious king" exclusively. Though the Danish party won a signal victory at the outset, by obtaining the insertion in the charter of provisions stipulating that only native-born Danes should fill the highest dignities of the state, the king's German counsellors continued paramount during the earlier years of his reign. The ultimate triumph of the Danish party dates from 1539, the dangers threatening Christian III. from the emperor Charles V. and other kinsmen of the imprisoned Christian II. convincing him of the absolute necessity of removing the last trace of discontent in the land by leaning exclusively on Danish magnates and soldiers. The complete identification of the Danish king with the Danish people was accomplished at the Harredag of Copenhagen, 1542, when the nobility of Denmark voted that "the Danish people shall have the property to pay off his heavy debt to the Holsteiners and Germans.

The pivot of the foreign policy of Christian III. was his alliance with the German Evangelical princes, as a counterpoise to the persistent hostility of Charles V., who was determined to support the hereditary claims of his nieces, the daughters of Christian II., to the Scandinavian kingdoms. War was actually declared against Charles V. in 1542, and, though the German Protestant princes proved faithless allies, the closing of the Sound against Dutch shipping proved such an effective weapon in King Christian's hand that the Netherlands compelled Charles V. to make peace with Denmark at the diet of Spires, the 23rd of May 1544. The foreign policy of Christian's later days was regulated by the peace of Spires. He carefully avoided all foreign complications; refused to participate in the Schmalkaldic war of 1546; mediated between the emperor and Saxony after the fall of Maurice of Saxony at the battle of Sivershausen in 1553, and contributed essentially to the conclusion of peace. King Christian III. died on New Year's Day 1559. Though not perhaps a great, he was, in the fullest sense of the word, a good ruler. A strong sense of duty, genuine piety, and a cautious but businesslike pusillanimous common-sense coloured every action of his patient, laborious and eventful life. But the work he left behind him is the best proof of his statesmanship. He found Denmark in ruins; he left her stronger and wealthier than she had ever been before.

See Danmarks Riges Historie, vol. 3 (Copenhagen, 1887-1901); Huitfeld, King Christian III.'s Historie (Copenhagen, 1905); Bain, Scandinavia, cap. iv. v. (Cambridge, 1905). (R. N. B.)

CHRISTIAN IV. (1577-1648), king of Denmark and Norway, the son of Frederick II., king of Denmark, and Sophia of Mecklenburg, was born at Fredriksborg castle in 1577, and succeeded to the throne on the death of his father (4th of April 1588), attaining his majority on the 17th of August 1596. On the 27th of November 1597 he married Anne Catherine, a daughter of Joachim Frederick, margrave of Brandenburg. The queen died fourteen years later, after bearing Christian six children. Four years after her death the king privately wedded a handsome young noblewoman, Christina Montem, by whom he had twelve children,—a connexion which was to be disastrous to Denmark.

The young king's court was one of the most joyous and magnificent in Europe; yet he found time for work of the most various description, including a series of domestic reforms (see Denmark: History). He also did very much for the national armaments. New fortresses were constructed under the direction of Dutch engineers. The Danish navy, which in 1596 consisted of but twenty-two vessels, in 1610 rose to sixty, some of them being built after Christian's own designs. The formation of a national army was more difficult. Christian had to depend mainly upon hired troops, supported by native levies recruited for the most part from the peasantry on the crown domains. His first experiment with his newly organized army was successful. In
the war with Sweden, generally known as the "Kalmar War," because its chief operation was the capture by the Danes of Kalmar, the eastern fortress of Sweden, Christian compelled Gustavus Adolphus to give way on all essential points (treaty of Knäred, 20th of January 1633). He now turned his attention to Germany. His object was twofold: first, to obtain the control of the great German rivers the Elbe and the Weser, as a means of securing his dominion of the northern seas; and secondly, to acquire the secularized German bishoprics of Bremen and Werden as appanages for his younger sons. He skillfully took advantage of the alarm of the German Protestants after the battle of White Hill in 1620, to secure the coad junctorship to the see of Bremen for his son Frederick (September 1621), a step followed in November by a similar arrangement as to Werden; while Hamburg by the compact of Steinburg (July 1621) was induced to acknowledge the Danish overlordship of Holstein. The growing ascendency of the Catholics in North Germany in and after 1623 almost induced Christian, for purely political reasons, to intervene directly in the Thirty Years' War. For a time, however, he stayed his hand, but the urgent solicitations of the western powers, and, above all, his fear lest Gustavus Adolphus should supplant him as the champion of the Protestant cause, finally led him to plunge into war against the combined forces of the emperor and the League, without any adequate guarantees of co-operation from abroad. On the 9th of May 1625 Christian quitted Denmark for the front. He had at his disposal from 19,000 to 25,000 men, and at first gained some successes; but on the 27th of August 1626 he was utterly routed by Tilly at Lutter-am-Barenberge, and in the summer of 1627 both Tilly and Wallenstein, ravaging and burning, occupied the duchies and the whole peninsula of Jutland. In his extremity Christian now formed an alliance with Sweden (1st of January 1628), whereby Gustavus Adolphus pledged himself to assist Denmark with a fleet in case of need, and shortly afterwards a Swedo-Danish army and fleet compelled the enemy to raise the siege of Stalsund. Thus the last portion of a superior superiority was able to tide over her worst difficulties, and in May 1629 Christian was able to conclude peace with the emperor at Lübeck, without any diminution of territory.

Christian IV. was now a broken man. His energy was temporarily paralysed by accumulated misfortunes. Not only his political hopes, but his domestic happiness had suffered shipwreck. In the course of 1628 he discovered a scandalous intrigue of his wife, Christina Munk, with one of his German officers; and when he put her away she endeavoured to cover up her own disgrace by conniving at an intrigue between Vibeke Kruse, one of her discharged maids, and the king. In January 1630 the rupture became final, and Christina retired to her estates in Jutland. Meanwhile Christian openly acknowledged Vibeke as his mistress, and she bore him a numerous family. Vibeke's children were of course the natural enemies of the children of Christina Munk, and the hatred of them somewhat with influence on the future history of Denmark. Between 1630 and 1642, however, Christian gained both in popularity and influence. During that period he obtained once more the control of the foreign policy of Denmark as well as of the Sound tolls, and towards the end of it he hoped to increase his power still further with the assistance of his sons-in-law, Korfits Ulfeld and Hannibal Schested, who now came prominently forward.

Even at the lowest ebb of his fortunes Christian had never lost hope of retrieving them, and between 1629 and 1643 the European situation presented infinite possibilities to politicians with a taste for adventure. Unfortunately, with all his gifts, Christian was no statesman, and was incapable of a consistent policy. He would neither conciliate Sweden, henceforth his most dangerous enemy, nor guard himself against her by a definite system of counter-alliances. By mediating in favour of the emperor, after the death of Gustavus Adolphus in 1632, he tried to minimize the influence of Sweden in Germany, and did glean some minor advantages. But his whole Scandinavian policy was so irritating and vexatious that Swedish statesmen made up their minds that a war with Denmark was only a question of time; and in the spring of 1643 it seemed to them that the time had come. They were now able, thanks to their conquests in the Thirty Years' War, to attack Denmark from the south as well as the east; the Dutch alliance promised and the Swedes secured them at sea, and an attack upon Denmark would prevent them from utilizing the impending peace negotiations to the prejudice of Sweden. In May the Swedish Riksråd decided upon war; on the 12th of December the Swedish marshal Lennart Torstensson, advancing from Bohemia, crossed the northern frontier of Denmark; by the end of January 1644 the whole peninsula of Jutland was in his possession. This totally unexpected attack, conducted from first to last with consummate ability and lightning-like rapidity, had a paralysing effect upon Denmark. Fortunately, in the midst of almost universal helplessness and confusion, Christian IV. knew his duty and had the courage to do it. In his sixty-sixth year he once more displayed something of the magnificent energy of his triumphant youth. Night and day he laboured to levy armies and equip fleets. Fortunately too for him, the Swedish government delayed hostilities in Scania till February 1644, so that the Danes were able to make adequate defensive preparations and save the important fortress of Malmö. Torstensson, too, was unable to cross from Jutland to Fünen for want of a fleet, and the Dutch auxiliary fleet which came to his assistance was defeated between the islands of Sylt and Rönö on the west coast of Schleswig by the Danish admirals. Another attempt to transport Torstensson and his army to the Danish islands by a large Swedish fleet was frustrated by Christian IV. in person on the 1st of July 1644. On that day the two fleets encountered off Kolberge Heath, S.E. of Kiel Bay, and Christian displayed a heroism which endeared him ever after to the Danish nation and made his name famous in song and story. As he stood on the quarter-deck of the "Trinity" a cannon close by was exploded by a Swedish bullet, and splinters of wood and metal wounded the king in thirteen places, blinding one eye and flinging him to the deck. But he was instantly on his feet again, cried with a loud voice that it was well with him, and set out his one example of duty by remaining on deck till the fight was over. Darkness at last separated the contending fleets; and though the battle was a drawn one, the Danish fleet showed its superiority by blockading the Swedish ships in Kiel Bay. But the Swedish fleet escaped, and the annihilation of the Danish fleet by the combined navies of Sweden and Holland, after an obstinate fight between Fehmarn and Lolland at the end of September, exhausted the military resources of Denmark and compelled Christian to accept the mediation of France and the United Provinces; and peace was finally signed at Brömsebro on the 8th of February 1645.

The last years of the king were still further embittered by sordid differences with his sons-in-law, especially with the most ambitious of them, Korfits Ulfeld. On the 21st of February 1648, at his earnest request, he was carried in a litter from Frederiksberg to his beloved Copenhagen, where he died a week later. Christian IV. was a good linguist, speaking, besides his native tongue, German, Latin, French, and Italian. He was naturally cheerful and hospitable, he delighted in lively society; but he was also passionate, irritable and sensual. He had courage, a vivid sense of duty, an indefatigable love of work, and all the inquisitive zeal and inventive energy of a born reformer. Yet, though of the stuff of which great princes are made, he never attained to greatness. His own pleasure, whether it took the form of love or ambition, was always his first consideration. In the heyday of his youth his high spirits and passion for adventure enabled him to surmount every obstacle with  lions. But in the decline of life he reaped the bitter fruits of his lack of self-control, and sank into the grave a weary and broken-hearted old man.

CHRISTIAN V. (1640-1669), king of Denmark and Norway, the son of Frederick III. of Denmark and Sophia Amelia of
CHRISTIAN VII.–IX.

Brunswick-Lüneburg, was born on the 15th of April 1646 at Flensberg, and ascended the throne on the 9th of February 1670. He was a weak despot with an exaggerated opinion of his dignity and his prerogatives. Almost his first act on ascending the throne was publicly to insult his consort, the amiable Charlotte Amelia of Hesse-Cassel, by introducing into court, as his officially recognised mistress, Amelia Moth, a girl of sixteen, the daughter of his former tutor, whom he made countess of Samsö. His personal courage and extreme affability made him highly popular among the lower orders, but he showed himself quite incapable of taking advantage permanently of the revival of the national energy, and the extraordinary overflow of native middle-class talent, which were the immediate consequences of the revolution of 1660. Under the guidance of his great chancellor Grîffenfeld, Denmark seemed for a brief period to have a chance of regaining her former position as a great power. But in sacrificing Grîffenfeld to the clamour of his adversaries, Christian did serious injury to the monarchy. He frittered away the resources of the kingdom in the unremunerative Swedish war of 1675–79, and did nothing for internal progress in the twenty-nine years of his reigned. He died in a hunting accident on the 25th of August 1699.

See Peter Edvard Holm, Danmarks indre Historie under Enevælden (Copenhagen, 1881–86); Adolf Ditlev Jørgensen, Peter Grîffenfeld (Copenhagen, 1893); Robert Niabet Bain, Scandinavia cap. x., (Cambridge, 1905).

CHRISTIAN VII. (1749–1808), king of Denmark and Norway, was the son of Frederick V., king of Denmark, and his first consort Louisa, daughter of George II. of Great Britain. He became king on his father’s death on the 14th of January 1766. All the earlier accounts agree that he had a winning personality and considerable talent, but he was badly educated, systematically poisoned by a brutal governor and hopelessly debauched by corrupt pages, and grew up a semi-idiot. After his marriage in 1766 with Caroline Matilda (1751–1775), daughter of Frederick, prince of Wales, he abandoned himself to the worst excesses. He ultimately sank into a condition of mental stupor, and became the obedient slave of the uppstart Struensee (q.v.). After the fall of Struensee (the warrant for whose arrest he signed with indifference), for the last six-and-twenty years of his reign, he was only nominally king. He died on the 13th of March 1808. In 1772 the king’s marriage with Caroline Matilda, who had been seized and had confessed to criminal familiarity with Struensee, was dissolved, and the queen, retaining her title, passed her remaining days at Celle, where she died on the 11th of May 1775.

See E. S. F. Reverdil, Struensee et sa cour de Copenhague, 1766–1772 (Paris, 1828); Danmarks Rige Historie, vol. v. (Copenhagen, 1867–1905); and for Caroline Matilda, Sir F. C. L. Wraxall, Life and Times of Queen Caroline Matilda (1864), and W. H. Wilkins, A Queen of Tears (1904).

CHRISTIAN VIII. (1786–1848), king of Denmark and Norway, the eldest son of the crown prince Frederick and Sophia Frederica of Mecklenburg-Schwerin, was born on the 15th of September 1786 at Christiansborg castle. He inherited the talents of his highly gifted mother, and his amiability and handsome features made him very popular in Copenhagen. His unfortunate first marriage with his cousin Charlotte Frederica of Mecklenburg-Schwerin was dissolved in 1810. In May 1813 he was sent as a prisoner of war to the island of Moa, but was then send to the monastery of the Holy Cross, to which he had been very rudely shaken by the disastrous results of Frederick VI.’s adhesion to the falling fortunes of Napoleon. He did all he could personally to strengthen the bonds between the Norwegians and the royal house of Denmark, and though his endeavours were opposed by the so-called Swedish party, which desired a dynastic union with Sweden, he placed himself at the head of the Norwegian party of independence, and was elected regent of Norway by an assembly of notables on the 16th of February 1814. This election was confirmed by a Storting held at Eldsvold on the 10th of April, and on the 17th of May Christian was elected king of Norway, despite the protests of the Swedish party. Christian next attempted to interest the great powers in his cause, but without success. On being summoned by the commissioners of the allied powers at Copenhagen to bring about a union between Norway and Sweden in accordance with the terms of the treaty of Kiel, and then return to Denmark, he replied that, as a constitutional king, he could do nothing without the consent of the Storting, to the conviction of which a suspension of hostilities on the part of Sweden was the condition precedent. Sweden refusing Christian’s conditions, a short campaign ensued, in which Christian was easily worsted by the superior skill and forces of the Swedish crown prince (Bernadotte). The brief war was finally concluded by the convention of Moss on the 4th of August 1814 (see NORWAY: History). Henceforth Christian’s suspected democratic principles made him persona inagritissima at all the reactionary European courts, his own court included, and he and his second wife, Caroline Amelia of Augustenburg, whom he married in 1815, lived in comparative retirement as the leaders of the literary and scientific society of Copenhagen. It was not till 1831 that old King Frederick gave him a seat in the council of state. On the 13th of December 1839 he ascended the Danish throne as Christian VIII. The Liberal party had high hopes of “the giver of constitutions,” but he disappoints this expectation, and rejecting every Liberal project. Administrative reform was the only reform he would promise. He died of blood-poisoning on the 20th of January 1848.

See Just Matthias Thiele, Christian den Ottende (Copenhagen, 1848); Yngvar Nielsen, Bidrag til Norges Historie (Christiania, 1882–1886).

CHRISTIAN IX. (1818–1906), king of Denmark, was a younger son of William, duke of Schleswig-Holstein-Sonderburg-Glücksburg (d. 1831), a direct descendant of the Danish king Christian III. by his wife Louise, a daughter of Charles, prince of Hesse-Cassel (d. 1836), and grand-daughter of King Frederick V. Born at Gottorp on the 8th of April 1818, Christian entered the army, and alone among the members of his family served with the Danish troops in Schleswig during the insurrection of 1848, but he was a personage of little importance until about 1852, ten years after his marriage with Louise (1817–1898), daughter of William, prince of Hesse-Cassel (d. 1867), and cousin of King Frederick VII. At this time it became imperative that satisfactory Tovison should be made for the succession to the Danish throne. The marriage of this, King Christian VII., was childless, and the representatives of the great power, and settled the crown on Prince Christian and his wife (May 1852), an arrangement which became part of the law of Denmark in 1853. The “protocol king,” as Christian was sometimes called, ascended the throne on Frederick’s death in November 1863, and was at once faced by formidable difficulties. Reluctantly he assented to the policy which led to war with the combined power of Austria and Prussia, and to the separation of the duchies of Schleswig, Holstein and Lauenburg from Denmark (see SCHLESWIG-HOLSTEIN QUESTION). Within the narrowed limits of his kingdom Christian’s difficulties were more protracted and hardly less serious. During almost the whole of his reign the Danes were engaged in a political struggle between the “Right” and the “Left,” the party of order and the party of progress, the former being supported in general by the Landshing, and the latter by the Folketing. The king’s sympathies lay with the more conservative section of his subjects, and for many years he was successful in preventing the Radicals from coming into power. The march of events, however, was too strong for him, and in 1901 he assented in a dignified manner to the formation of a “cabinet of the Left” (see DENMARK: History). In spite of these political disturbances Christian’s popularity with his people grew steadily, and was enhanced by the patriarchal and unique position which in his later years he occupied in Europe. With his wife, often called “the aunt of all Europe,” he was related to nearly all the European sovereigns. His eldest son Frederick had married a daughter of Charles XV. of Sweden; his second son George had been king of the Hellenes since 1863; and his youngest son Waldemar (b. 1858) was married to Marie d’Orléans, daughter of Robert, due de Chartres. Of his three daughters, Alexandra married Edward VII. of Great Britain;
Christian, W.—Christiania

Christian, William (1668–1663), Manx politician, a son of Ewan Christian, one of the Manx deemsters, was born on the 14th of April 1668, and was known as illiam Dhone, or Brown William. In 1648 the lord of the Isle of Man, James Stanley, 7th Earl of Derby, appointed Christian his receiver-general; and when in 1651 the Earl crossed to England to fight for Charles II, he left him in command of the island militia. Derby was taken prisoner at the battle of Worcester, and his famous countess, Charlotte de la Tremouille, who was residing in Man, sought to obtain her husband's release by negotiating with the victorious parliamentarians for the surrender of the island. At once a revolt headed by Christian broke out, partly as a consequence of this step, partly owing to the discontent caused by some agrarian arrangements recently introduced by the Earl. The rebellion, which was at first, probably owing to his connivance the island was soon in the power of Colonel Robert Duckenfield, who had brought the parliamentary fleet to Man in October 1651. The countess of Derby was compelled to surrender her two castles, Castle Rushen and Peel castle, while Christian remained receiver-general, becoming governor of the island in 1656. Two years later, however, he was accused of misappropriating some money; he fled to England, and in 1660 was arrested in London. Having undergone a year's imprisonment he returned to Man, hoping that his offence against the Earl of Derby would be condoned under the Act of Indemnity of 1661; but, anxious to punish his conduct, Charles, the new Earl of Derby, ordered his seizure; he refused to plead, and a packed House of Keys declared that in this case his life and property were at the mercy of the Lord of the Island. The deemsters then passed sentence, and in accordance therewith Christian was executed by shooting on the 2nd of January 1663. This arbitrary act angered Charles II. and his advisers; the deemsters and others who were punished in his suppression was made to refund the money. Christian is chiefly celebrated through the Manx ballad Baas Illiam Dhone, which has been translated into English by George Borrow, and through the references to him in Sir Walter Scott's Power of the Peak.

See A. W. Moore, History of the Isle of Man (1900).

Christian of Brunswick (1599–1626), bishop of Halberstadt and a general during the earlier part of the Thirty Years' War, a younger son of Henry Julius, duke of Brunswick-Wolfenbüttel, was born at Groningen on the 20th of September 1599. Having succeeded his father as bishop of Halberstadt in 1616, he obtained some experience in warfare under Maurice, prince of Orange, in the Netherlands. Raising an army he entered the service of Frederick V., elector palatine of the Rhine, just after that prince had been driven from Bohemia; gloriing in his chivalrous devotion to Frederick's wife Elizabeth, he attacked the lands of the elector of Mainz and the bishoprics of Westphalia. After some successes he was defeated by Tilly at Höchst in June 1622; then, dismissed from Frederick's service, he entered that of the United Provinces, losing an arm at the battle of Fleurus, a victory he did much to win. In 1623 he gathered an army and broke into lower Saxony, but was beaten by Tilly at Stadtholm and driven back to the Netherlands. When in 1625 Christian IV., king of Denmark, entered the arena of the war, he took the field again in the Protestant interest, but after some successes he died at Wolfenbüttel on the 16th of June 1626. Christian, who loved to figure as "the friend of God, the enemy of the priests," is sometimes called "the mad bishop," and was a merciless, cruel, and blasphemous man.

Christian Catholic Church, the name assumed by a religious organization founded at Zion City near Chicago, Illinois, U.S.A., in 1866, by John Alexander Dowie (q.v.). Its members added to the usual tenets of Christianity a special belief in faith-healing, and laid much stress on united consecration services and the threefold immersion of believers. To assist Dowie, assistant overseers were appointed, and the operations of the community included religious, educational, and commercial departments. Small branches sprang up in other parts of the United States, Mexico, Canada, Europe, and Australasia. At the end of 1901 there were nearly 12,000 baptized believers. After 1903 considerable dissension arose among Dowie's followers: he was deposed in 1906; and after his death (1907) the city gradually became a community of normal type.

Christian Connection, a denomination of Christians in North America formed by secession, under James O'Kelly (1735–1826), of members of the Methodist Episcopal Church in North Carolina in 1793. The movement resembled those under the Campbells and Stone in Kentucky in 1801–1804, and in Lyndon, Vermont, among the Baptists in 1800. The predisposing cause in each case was the desire to be free from the "bondage of creed." Some of O'Kelly's followers joined the Disciples of Christ (q.v.). Their form of church government is Congregational; they adhere to the Bible as the only rule of faith and practice, and while adopting immersion as the proper mode of baptism, freely welcome Christians of every sect to their communion. They number about 200,000 members, mainly in the states of Ohio, Indiana, and Illinois. The original seceders in Virginia and North Carolina bore for a time the name "republican Methodists," and then called themselves simply "Christians," a designation which with the pronunciation "Christ-yan" is still often applied to them. Their position is curiously akin to that outlined by William Chillingworth (q.v.) in his famous work The Religion of Protestants (1637–1638).

Christian Endeavour Societies, organizations formed for the purpose of promoting spiritual life among young people. They date from 1881, in which year Dr Francis E. Clark (q.v.) formed a Young People's Society of Christian Endeavour in his (Congregational) church at Portland, Maine, U.S.A. The idea was taken up elsewhere in America and spread to other countries, till, under the presidency of Dr Clark, a huge number of affiliated societies came into operation throughout the world. They take as their objects "For Christ and the Church," and have as their aims the promotion of the Christian faith, and, in some cases, the preparation of young men and women for active services in the Church. The organization is international and interdenominational, a World's Christian Endeavour Union being formed in 1895. The members do not form a separate denomination, but remain attached to their respective churches, being grouped in voluntary district federations.

Christiania (officially Christiannia), the capital of Norway, forming a separate county (amlt), and the seat of a bishopric (stift). Pop. (1901) 229,101. It lies on the southeastern coast, at the head of Christiania Fjord, about 80 m. from the open waters of the Skagerrak, 59° 34' N. (about the latitude of the southern extremity of the Shetland Islands) and 10° 45' E., mainly on the west bank of the small Aker river. The situation is very beautiful, pine-wooded hills rising sharply behind the city, while several islands stud the fjord. The town is mainly modern, having increased rapidly in and since the second half of the 19th century, when brick and stone largely superseded wood as the building material. It is the seat of government, the county courts, of the parliament (Storting), and of a university. The harbor has two docks and a quayside, while the larger steamers lie, and the Pipervik, west of this. On the promontory intervening between these two inlets stands the old fortress of Akershus, occupied as an arsenal and prison, and having a pleasant promenade upon its ramparts. Until 1719 it was a royal palace. At the head of the Bjørvik the principal railway station (Hovedbanegården) stands in the Jernbanetorget (railway square), and north-west from this runs the principal street, Karl-Johans-gade. In this street, passing the Vor Freisers Kirke (Church of our Saviour), the Stortingsbygning
CHRISTIANITY

(parliament-house, 1866) is seen, facing a handsome square planted with trees. Beyond this is the National theatre (1859), with colossal statues of the dramatists Ibsen and Bjørnson. It faces the Fridericiana University, housed in three buildings dating from 1853, but founded by Frederick VI of Denmark in 1811, embracing the five faculties of theology, law, medicine, history and philology, mathematics and natural sciences. The equipment of the university is very complete: it has attached to it a large and valuable library, natural history, ethnological and numismatic collections, with one of Scandinavian antiquities; also botanical gardens and an observatory. The Karl-Johans-gade gives upon the beautiful Slotspark, a wooded elevation crowned with the royal palace (slot), a plain building completed in 1848. North of the university is the museum of art, containing a noteworthy collection of sculpture and paintings of ancient and modern foreign masters, and of native works. The historical museum adjoining this contains northern antiquities, including two Viking's ships, excavated, in 1867 and 1880 respectively, from the burial-places of the Viking chief who owned and, according to custom, were buried in them. Another noteworthy collection is that of industrial art. The Bank of Norway is also in the city and the principal railway stations and docks and harbours. Other institutions are the Freemasons' Lodge, housed in one of the handsomest buildings in the city (1844), a conservatory of music, naval, military and art schools, Athenæum, and the great Dampskjøkken or kitchen (1858), where dinners are provided for the poor.

The suburbs of Christiania are attractive and rapidly growing. On the east side of the river Aker is that of Oslo, with the existing episcopal palace, and an old bishop's palace, in which James VI. of Scotland (L. of England) was betrothed to Princess Anne of Denmark (1586). In the environs of the city are the royal pleasure castle of Oscarshall (1847-1852), on the peninsula Bygdø (Ladugård) to the west of the city, and the Norwegian national museum (1881), containing industrial and domestic exhibits from the various provinces. Close at hand is an interesting collection of old Norwegian buildings, brought here from all parts, and re-erected, including an example of the timber church of the 12th century (Slavskirker). A collection of ancient agricultural implements is also shown. On Hovedø (Head Island) in the fjord, immediately opposite to the Akerhus, are the ruins of a Cistercian monastery, founded in 1147 by monks from Kirkstead in Lincolnshire, England, and burnt down in 1532. There are sanitary stations and inns among the surrounding hills, on which beautiful gardens are laid out, such as Hans Haugen, Frugnersaatet, Holmenkollen, where the famous ski (snow-shoe) races are held in February, and Vonenkollen. Electric tramways connect the city and suburbs, and local steamers run from the Pipervik to the neighbouring islands and fjord-side towns and villages.

Christiania has two railway stations, the Hovedbanegarden by the Bjørvik, and the Vestbanegarden by the Pipervik. From the first runs south to Fredrikshald and Gothenburg, east to Charlottenburg and Stockholm, north to Hamar and Trondheim, and Otta in Gudbrandsdal, and to Gjøvik and the Valdres district. From the west station start the lines to Drammen, Larvik, Skien and Kongsberg (for the Telemark district). The eastward extension of the railway between Bergen and Vossenvegen, undertaken in 1896, had as its ultimate object the connection of Christiania and Bergen by rail. With these extensive land communications Christiania is at once the principal emporium of southern Norway, and a favourite centre of the extensive tourist traffic. Regular passenger steamers serve the port from Hull, Newcastle, Grangemouth and London, from Trondheim, Bergen and the Norwegian coast towns, from Hamburg, Amsterdam, Antwerp, &c. Except for two large shipbuilding yards, one with a floating dock, the other with a dry dock, most of the manufactories are concentrated in the suburb of Sagene, on the north side of the city, deriving their motive power from the numerous falls of the river Aker. They embrace factories for cotton and woolen spinning and weaving, paper, flour, soap and oil, bricks and tiles, matches, nails (especially horse-shoe nails), margarine, foundries and engineering shops, wood-pulp, tobacco, matches, linen, glass, sail-cloth, hardware, gunpowder, chemicals, with sawmills, breweries and distilleries. There is also a busy trade in the preparation of granite paving-stones, and in the storing and packing of ice. Imports greatly exceed exports, the annual values being about 7½ and 1½ millions sterling respectively. The former consist principally of grain and flour, cottons and woollens, coffee, iron (raw and manufactured), coal, bacon and salt meat, oils, sugar, machinery, fish, jute and hemp, paper, hangings, paints, colours, &c., wines and spirits, raw tobacco, copper, zinc, lead and tin, silk, molasses and other commodities. The principal exports are wood-pulp, timber, nails, paper, butter and margarine, matches, condensed milk, fish, leather and hides, ice, sealskins, &c. Of the imports, Great Britain supplies the greater part of the cotton and woolen yarn, the machinery (including ships), and the raw metals; the United States about one-half of the oils and fats, and a large proportion of the food-stuffs, and skins, feathers, &c. Of the exports, almost the whole of the timber goes to Great Britain, together with the larger portion of the paper and food-stuffs (butter, &c.). The harbour is ice-bound for three or four months in the winter, when ships lie at Drøbak, lower down the fjord; but ice-breakers are also used. The trade of the port, the value of which was £47,000 from the construction of a pier, a harbour for fishing-boats, connected by a mole, and a quay, 34½ ft. long, on the shore underneath the Akerhus. These works signalized a great scheme of improvement, involving a general rearrangement of the entire harbour.

The present suburb of Oslo represents the original city, which was founded on this site under that name (or Opolo) by Harald Sigurdson in 1048. By the close of the 14th century it was established as the chief city of Norway. Trade was long dominated by the powerful Hanscatic League, at least until the beginning of the 16th century. The town, built mainly of wood, was no less subject to fires than all Norwegian towns have always been, and after one of these King Christian IV. refounded the capital on the new site it now occupies, and gave his name to it in 1624. By the close of the century it was fortified, but this did not prevent Charles XII. from gaining possession of it in 1716.

See L. Daas, Dct gæle Christiania, 1624-1824 (Christiania, 1890); Y. Nielsen, Christiania og Umgegend (Christiania, 1894); O. Amæus, La Ville de Christiania , Résumé historique, &c. (Christiania, 1900).

CHRISTIANITY, the religion which accepts Jesus Christ as Lord and Saviour, embracing all who profess and call themselves Christians, the term derived from his formal title (Χριστός, i.e. the anointed). Within this broad characterization are found many varieties of cult, organization and creed (see CHURCH HISTORY). Christianity is classed by the students of the science of religion as a universal religion; it proclaims itself as intended for all men without distinction of race or caste, and as in possession of absolute truth. In fact, Christianity has been widely accepted by varied races in very different stages of culture, and it has maintained itself through a long succession of centuries in lands where the transformations in political structure, the revolutions in social conditions, and the changes in science and philosophy, have been numerous and extreme. Beginning in Asia, Christianity extended itself rapidly throughout the Roman empire and beyond its borders among the barbarians. When the Empire in the 4th century adopted it, its organization and teaching were carried throughout the western world. The influences and motives and processes which led to the result were many and varied, but ultimately in one way or another it became the religion of Europe and of the nations founded by the European races beyond the seas and in the northern part of Asia called Siberia. Beyond these bounds it has not greatly prospered. The explanation of the apparent bounding of Christianity by Europe and its offsprings is not, however, to be found in any psychological peculiarity separating the European races from those of other continents, nor in any special characteristic of Christianity which fits it for European soil. For not only were its founder and his disciples Asians, and the original authoritative writings Semitic, but Asiatic tribes and nations coming into Europe have been readily converted.
CHRISTIANITY

Missions in Asia too have achieved sufficient success to prove that there exists no inherent obstacle either in the gospel or in the Asiatic mind. Moreover, Christianity was once represented in Asia by a powerful organization extending throughout Persia and central Asia into India (see PERSIA). Mutatis mutandis, the same applies to Africa also, and Christianity still survives in both continents in the Coptic, Abyssinian and Armenian Churches. The explanation is rather to be sought in the political condition of the early centuries of the Christian era, especially in the rise of Mahommedanism. This may be regarded indeed as a form of Christianity, for it is not more foreign perhaps to the prevailing type than are some sects which claim the name. It exerted a strong influence upon Europe, but its followers have been peculiarly unsusceptible to missionary labours, and even in Europe have retained the faith of the Prophet. In the limitations of the Roman empire and in the separation of East and West consequent upon its decline, Christianity, as a dominant religion, was confined for a thousand years to Europe, and even portions of this continent for centuries were in the hands of its great foe. The East appeared as the Mahommedan dominions, and beyond these the continents of Asia and Africa were so dimly discerned that little reciprocal influence was felt. Thus the development of the two great civilized portions of the race in Europe and Asia followed independent lines in religion as in all else; and for centuries, the northern border, was left untouched by the progress of enlightenment.

Not only is Christianity thus the religion of a wide variety of races but across the divisions there cut other lines. In its organization Christianity exists in three great divisions, Roman, Greek and Protestant, and in various ancient sects in the Orient. The Roman Catholic and Greek divisions of the Christian Church are homogeneous in organization, but in Protestantism certain denominations are national, established by differing governments, and others are independent of governmental aid, making a large number of differing denominations. Some of these divisions are mutually antagonistic, denying to each other the name of Christian and even the hope of salvation.

According to a second classification, Christianity may be placed among the "individual" religions, since it traces its origins, like Islam and Buddhism, to an individual as its founder. This beginning is not in the dimness of antiquity nor in a multitude of customs, beliefs, traditions, rites and personalities, as is the case with the so-called "natural" religions. It is not implied that in the formation of the "natural" religions individuals were not of great importance, nor that on the other hand individuals of "natural" religions, the founder formed his faith independently of the community of which he was a part; but only that as undoubted historic facts certain religions, in tracing their lines to individuals, thereby acquired a distinctive character, and retain the impress of their founder. Such religions begin as a reform or a protest or revolts. They proclaim either a new revelation, or the return to an ancient truth which has been forgotten or distorted. They demand repentance and change of heart, i.e. the renouncing of the ordinary faith of the community and the acceptance of a new gospel. Thus demanding an act of will on the part of individuals, they are classed once more as "ethical" religions. To be sure, the new is built upon the old—in part unconsciously—and the rejection of the faith of the past, however violent, is never thoroughgoing. In consequence the old affects the new in various ways. Thus in Buddhism the presuppositions which Buddha uncritically took over work out their logical results in the Mahayana, so that great sects calling themselves "Buddhist" affirm what the Master denied and deny what he taught. Christianity takes Judaism (see HEBREW RELIGION) for granted, rejects it in part as a merely preparatory stage, in part reinterprets it, and does not submit what it accepts to rigorous scrutiny. As a result the Old Testament (see BIBLE) remains not only as the larger part of the Christian canon, but, sometimes, in some churches, as obscuring its distinctive truth. Moreover, in the transference of Christianity from the Jewish to the Greek-Roman world again various elements were taken into it. More properly perhaps we might consider the Greek and Roman civilization as the permanent element—so that the relationship to it was not different from the relationship to Judaism. In part it was denied, in part it was of purpose accepted, in still larger part unconsciously the Greek-Roman converts took over with them the presuppositions of their older world-view—and thus formed the moulds into which the Christian truth was run. Here again, in some instances the pre-Christian elements so asserted themselves as to obscure the new and distinctive teaching.

Christianity, regarded objectively as one of the great religions of the world, owes its rise to Jesus of Nazareth, in ancient Galilæ. (see JESUS CHRIST) By reverent disciples his ancestry was traced to the royal family of David, and his birth is ascribed by the church to the miraculous act of God. His life was spent, until the beginning of his public ministry, in humble circumstances as the son of a carpenter and his wife, Joseph and Mary. Of Joseph we hear nothing after the boyhood of Jesus, who followed the same trade, supporting himself and perhaps his mother and younger brothers and sisters. Of this period we have only a few fragmentary anecdotes and a stray reference or two. At thirty years of age he appeared in public, and after a short period (we cannot determine how long, but possibly eighteen months) he was crucified, upon the accusation of his countrymen, by the Romans. It is not necessary to enter into his life, or rather the life he led, for he was not only cared for by his followers, but he had been carefully trained in the sacred books, as was usual with his people. Belonging neither to the aristocracy nor to the learned class, he was one of the common people yet separate from them—a separation not of race or caste or education, but of unique personality.

His career is understood only in the light of his relations to Judaism (see HEBREW RELIGION). This faith, in a peculiarly vivid fashion, illustrates the growth and development of religion, for its great teachers in the highest degree possessed what the Germans call God-consciousness. The Hebrew national literature centres in the thought of God. It is Yahweh who is all in all, the father, the leader, the hope, the hero of his people. No other national literature is so continuously and so highly religious. Another factor gives it still greater interest for the student of religion,—in it the process of religious thought can be traced, and the varying elements of the religious life seen in harmony and in conflict.

In the early period the Hebrew religion was of the ordinary Semitic type. In its ancient stories were remnants of primitive beliefs, fabulous notions, anthropomorphic gods, of native form, of worship, of magic and divination, of local and tribal cults. Out of these developed, by the labours of the prophets, a religion of high spirituality and exalted ethical ideals. According to it God demands not ritual nor sacrifice nor offerings. He does not delight in prayers and praise, but he demands truth in the soul and bids man to walk humbly and deal righteously and mercifully with his brother (Micah vi. 6-8; Isa. i. 2-20). He requires kindness, forgiveness and loving sacrifice from all to all (Isa. lviii. 3-12). This conception of God revealed itself as so essential to the prophets that their intense national feeling was modified. God would not deliver Israel because it was his people, descended from Abraham, his chosen, but he would punish it even more severely than the other nations because it denied him by its sins (Amos iii. 1-2). Yet Israel would not be destroyed, for a spiritual remnant, loving and obeying God, would be saved and purified (Ezek. xxxvi. -xxxviii.). Thus Israel survived its misfortunes. When the national independence was destroyed, the prophetic teaching held the people together in the hope of a re-estabishment of the Kingdom when all nations should be subject to it and blessed in its everlasting reign of righteousness and peace (Isa. xl. ix., lx.).

Some of the prophets associated the restoration of the Kingdom with the coming of the Messiah, the anointed one, who should re-establish the line of David (Isa. ix. 6 f., xi. 1 f.; Micah v. 2; Ezek. xxxiv. 23, xxxvii. 24; Zech. ix. 9; Ps. ii. 72). Others said nothing of such a one, but seemed to expect the regeneration of Israel through the labours, sufferings and triumphs of
CHRISTIANITY

the righteous remnant (Isa. iii., Ezek. xxxvi.-xxxvii.). By the
strong emphasis upon righteousness, the tribal Lord of Israel
was regarded as the universal God, of one relationship to all men.
This monothism was not primarily cosmological nor meta-
physical, but ethical. The Jews showed little capacity for abstract
reasoning and never pursued their inquiries to the discovery of
ultimate principles. Thus they did not develop a systematic
cosmology, nor formulate a system of metaphysics. Their
religion was pre-eminently "theocratic"; God was thought of
as King, enthroned in heaven and supreme. In the beginning
as a tribal deity his powers were limited and he was involved
in the fortunes of his people. But as the concept of Yahweh
was deepened and broadened, and, especially after the develop-
ment of ethical monotheism, not only was he believed to possess
power sufficient to ensure the triumph of his chosen people, but
to be the creator and ruler of all things in heaven and on earth,
the God whom all peoples should worship and obey.

But the prophetic teaching was obscured in part by the
nationalism of the prophets themselves, who exalted Israel as at
once God's instrument and the peculiar object of his love; and
in part by the triumph of a legal-ritualistic sacrificial system.
In the downfall of Jerusalem, the experiences of the exile in Bab-
lon, and the subsequent realization of the failure of monotheism,
were integrated into a church. Apart from the brief Maccabaean period,
the intense patriotism of the people centered in the ecclesiastical or-
ganization. As a result, cult and organization and code hardened,
forming a shell which proved strong enough to resist all dis-
integrating tendencies. Inevitably the freedom, spirituality and
universality of the prophetic teaching were obscured. In the 1st
century A.D. the national and priestly elements controlled;
doubtless many individuals still were faithful to the purer
prophetic message, though also zealous for the system of ritual
and sacrifice, but for the ruling majority ritualistic service was the
chief thing, justice, purity and mercy being subordinate. Hence
in their view all who did not participate in the national worship
and conform to the national usage were outcasts. The triumph
of Israel was to be accomplished by the miraculous power of a
Messiah who should descend out of heaven. His coming was
delayed, in part by the opposition of demons, in part by the
failure of the people to obey the law. This law embraced both
moral and ceremonial elements derived from varied sources, but
in the apprehension of the people alike regarded as of divine
authority. It could not be reduced without essential changes to
inquiry as to its meaning, because established by God. It was
contained in the Sacred Scriptures (see BIBLE: Old Testament),
which had been revealed by God supernaturally, and its meaning
was set forth by schools of learned men whose interpretations
were authoritative. The conception of salvation was mingled
with ideas derived from the East during and after the period of
captivity. The priesthood held still the ancient ideas. Salvation
was for the nation, and the individual was not necessarily
participant in it. Life after death was disbelieved or held as
the existence of shades. There could be no resurrection of the body
and no immortality (in the Greek sense). With these beliefs
were associated a certain worldliness and want of fervour. The
more actively and aggressively religious party, on the other hand,
adopted the belief in the resurrection of the body, and in the
individual's participation in the Messiah's kingdom; all the
pious would have their share in it, while the wicked would be
outcast. But these doctrines were variously conceived. By
some the Messiahian kingdom was thought of as permanent, by
others as intermediary, the external kingdom being transcendent.
So too there was much thought of a literal resurrection of the
souls and blood, while others thought that it would be transformed.
The rudiments of some of these ideas can be found in the prophets,
but their development took place after the exile, and indeed for
the most part after the conclusion of the writings accounted
canonical. Thus too the belief in a kingdom of demons held a
large place in the mind of the people, though the references to
such evil beings are almost absent from the sacred writings of the
Old Testament. Again it is to the East that we must look for
the origin of these ideas.

Jesus completed the prophetic teachings. He employed the
old phraseology and imagery, but he was conscious that he used
them in a new sense, and that he preached a new gospel of
great joy. Jesus was not a historian, a critic or a
theologian. He used the words of common men in the
sense in which common men understood them. He did
not employ the Old Testament as now reconstructed by scholar-
ship or judged by criticism, but in its simple and obvious and
traditional sense. And his background is the intellectual and
religious thinking of his time. The ideas of demons and of the
future, of the Bible and many other traditional conceptions,
are taken over without criticism. So the idea of God which he sets
forth is not that of a theologian or a metaphysician, but that of
the unlearned man which even the child could understand.
Yet though thus speaking in untechnical language, he revolution-
ized his terms and filled them with new meaning. His emphasis is
his own, and the traditional material affords merely the setting
for his thought. He was not concerned with speculative
questions about God, nor with abstract theories of his relation-
ship to the soul and to the world. God's continual presence, his
fatherly love, his transcendent righteousness, his mercy, his good-
ness, were the facts of immediate experience. Not in proofs by
metaphysical logic but in the reality of consciousness was the certainty
of God. Thus religion is freed from all secular and national elements in the simplest way. For Jesus did not divorce these
elements, nor urge against them, nor did he seek converts outside
of Israel, but he set forth communion with God as the most
certain fact of man's experience and as simple reality made it
accessible to every one. Thus his teaching contains the note of
universal— not in terms and proclamations but as plain matter
of fact. His way for others to this reality is likewise plain and
to the comprehension of the unlearned and of children.

For him repentance is put first, for how vastly changed is the
conception of the religious life! The intricacies of ritual and
theology are ignored, and ancient laws which contradict the
fundamental beliefs are unhesitatingly abrogated or denied.
He seizes upon the most spiritual passages of the prophets,
and revives and deepens them. He sums up his teaching in supreme
love to God and a love for fellow-man like that which we hold for
ourselves (Mark xii. 30-31). This supreme love to God is a
complete oneness with him in will, a will which is expressed in
service to our fellow-men in the simplest and most natural
relationship (Luke x. 25-37). Thus religion is ethical through and
through, as God's own nature, expressed in forgiveness, mercy,
rightness, and truth, not something transcendent, but
belongs to the realm of daily life. We believe in the Father of God
and in the Father of love, in a moral likeness (Matt. v. 43-48),
while of any metaphysical, or (so to speak) physical relationship to
God Jesus says nothing. With this clearly understood, man is to
live in implicit trust in the divine love, power, knowledge and
forgiveness. Hence he attains salvation, being delivered from
sin and fear and death, for the divine attributes are not ontological
entities to be discussed and defined in the schools, but they are
realities, entering into the practical daily life. Indeed they are
to be repeated in us also, so that we are to forgive our brethren as
we ask to be forgiven (Matt. vi. 12; Luke xi. 4).

As religion thus becomes thoroughly ethical, so is the notion
of the Messianic kingdom transformed. Its essential character-
istic is the doing of the Father's will on earth as in heaven.
Jesus uses parable after parable to establish its meaning. It is
a seed cast into the ground which grows and prospers (Matt.
xiii. 31-32). It is a seed sown in good ground and bringing
fruit, in bad ground and fruitless (Luke viii. 5-8; Mark
iv. 1-8). It is a pearl of great price for which a man should sell
all that he possesses (Matt. x. 37-39). It is not come "with
observation," so that men shall say "Lo here and lo there"
(Luke xix. 22-24). It is not of this world, and does not possess
the characteristics or the glory of the kingdom of the earth
(Luke xxii. 24-26; Mark x. 13-16). It is already present among
men (Luke xvii. 21). Together with these statements in our
sources are still mingled fragments of the more ordinary cata-
dysmic, apocalyptic conceptions, which in spite of much
ingenious exegesis, cannot be brought into harmony with Christ's predominant teaching, but remain as foreign elements in the words of the Master, possibly brought back through his disciples, or, more probably, used by Jesus uncritically—a part of the current religious imagery in which he shared.

It is often declared that in these teachings there is nothing new, and indeed analogies can be found for many sayings; yet nowhere else do we gain so strong an impression of originality. The net result is not only new but revolutionary; so was it understood by the Pharisees. They and Jesus spoke indeed the same words and appealed to the same authorities, but they rightly saw in him a revolutionist who threatened the existence of their most cherished hopes. The Messianic kingdom which they sought was opposed by point to the kingdom of which he spoke, and their God and his Father—though called by the same sacred name—were different. Hence almost from the beginning of his public ministry they constantly opposed him, the conflict deepening into complete antagonism.

Jesus has already been termed unique, one of the common people yet separated from them, and this description applies to the two aspects of his personality—his sympathy. In the meager records of his life there is evidence that he deemed no form of suffering humanity foreign to himself. This was not a mere sentiment, nor was his sympathy superficial, for it constituted the essential characteristic of his personality—"He went about doing good." In him the will of the Father for the redemption of the race was incarnate. This led him into the society of those outcasts who were condemned and rejected by the respectable and righteous classes. In contemptuous condemnation he was called the friend of the outcasts (Matt. xi. 19; Mark ii. 16-17), and on his part he proclaimed that these sinners would enter into the Kingdom of Heaven before the self-righteous saints (Matt. xxii. 31). Even the most repulsive forms of disease and sin drew from him only loving aid, while he recognized in all other men who laboured for the welfare of their fellows the most intimate relationship to himself. These constituted his family, and these were they whom his Father will bless.

Jesus recognized his unique position; he could not be ignorant of his powers. Even the prophets had spoken in the name of God; they had exercised the priestly nor prophetic authority, but uttered their truth as they were inspired to speak, and commanded men to listen and obey. As in Jesus the whole prophetic line culminates, so does its consciousness. Reverent toward the Holy Scriptures, he spoke not as their expositor but with a divine power which invests his words with immediate and full authority. The prophets use the formula, "Thus saith the Lord," but he goes beyond them and speaks in his own name, "Amen, I say unto you." He knew himself as greater than the prophets, indeed as him of whom the prophets spoke—the Messiah. Only through this self-consciousness can we explain his mission and the career of his disciples. The prophets up to John foretold the coming of the kingdom (Matt. xi. 11-13; Luke xvi. 10), but Jesus opened its doors and made possible entrance into it. Where he is there it is, and hence those who follow him are God's children, and those who refuse his message are left outside in darkness. He is to sit as enthroned, Judge and king, and by him is men's future to be determined (Matt. xxiv. 31 f.; Mark xiii. 26). Indeed it was his presence, more than his teaching which created his disciples. Great as were his words, greater was his personality. His disciples misunderstood what he said, but trusted and followed him. By him they felt themselves freed from sin and fear—and under the influence of a divine power.

Though his claims to authoritative pre-eminence thus took him out of the class of prophets and put him even above Elijah and Moses (Mark ix. 2-7; Luke vii. 28; Luke x. 23-24), and though naturally this self-assertion seemed blasphemous to those who did not accept him, yet as he had transformed the traditional notion of the kingdom, so did he the current thought of the Messiah. The pre-eminence was not to be of rank and glory but of service and self-sacrifice. In his kingdom there can be no strife for precedence, since its King comes not to be ministered unto but to minister and to give his life in the service of others (Mark ix. 33 f., x. 42-45). The formal acknowledgment of the Messiah's worth and position matters little, for to call him Lord does not ensure entrance into his kingdom (Matt. vii. 21-23). It is those who fail to recognize the spirit of sympathy and self-sacrificing service as divine and blaspheous redeeming love, who are in danger of eternal sin (Mark iii. 28-29). All who do the will of the Father, i.e. who serve their fellows, are the brethren of Christ, even though they do not call him Lord (Mark iii. 31-35; Matt. vii. 21); and those are blessed who minister to the needy even though ignorant of any relation to himself (Matt. xxv. 37-40). Finally, membership in his own selected company, or a place in the chosen people, is not of prime importance (Mark ix. 38-40; Luke xiii. 24-30).

Jesus also refuses to conform to the current ideas as to the establishment of the kingdom. He wrought miracles, it is true, because of his divine sympathy and compassion, but he refused to show miraculous signs as a proof of his Messianic character (Mark vii. 30-33). The tradition was that the Messiah's appearance was on a supernatural origin and was to be known as the son of Joseph and Mary (Matt. vi. 3-4). His kingdom is not to be set up by wonders and miraculous powers, nor is it to be established by force (Matt. xxvi. 52). Such means would contradict its fundamental character, for as the kingdom of loving service it can be established only by loving service. And as God is love, he can be revealed not by prodigies of power but only by a love which is faithful unto death.

Even the disciples of Jesus could not grasp the simplicity and profundity of his message; still less could his opponents. When the crisis came, he alone remained unshaken in his faith. He was accused of blasphemy to the ecclesiastical authorities and of insurrection to the civil rulers. He was condemned and crucified. His followers were scattered every man to his own place as sheep without a shepherd. Of his work nothing remained, not a written word, nor more than the rudiments of an organization. The decisive event, which turned defeat into victory and re-established courage and faith, was the resurrection of Jesus from the dead and his reappearance to his disciples. Our story will not permit the precise determination of the order or the nature of these appearances, but in any case from them arose the faith which was the basis of the Christian Church and the starting-point of its theology.

The death of Jesus as a criminal, and his resurrection, profoundly aroused the belief and hopes of the little group of Jews who were his followers. His person and mission assumed the first place in their affections and their thinking. He had been to them a prophet, mighty in word and deed, but he now becomes to them the Messiah, Christ. It is not his word but his person which assumes first place, and faith is acceptance of him—crucified and risen—as Messiah. Hence his followers early acquire the name Christians from the Greek form of the word. With this emphasis upon the Messiah the Jewish element would seem to be predominant, but as a matter of fact it was not so. The earlier group of disciples, it is true, did not appreciate the universality of the teaching of Jesus, and they continued zealous for Jesus himself, but St. Paul through his prophetic consciousness grasped the fundamental fact and became Jesus' true interpreter. As a result Christianity was rejected by the Jews and became the conquering religion of the Roman empire. In this it underwent another modification of far-reaching consequence.

In our earliest sources—the epistles of St. Paul—Christ is the pre-existent man from heaven, who had there existed in the form of God, and had come to earth by a voluntary act of self-humiliation. He is before and above all things. By him all things exist. In the Johannine writings he is the Son of God—the Logos who in the beginning was with God—of whom are all things— who lightens every man—and who was incarnate in Jesus. Here the cosmological element is
again made prominent though not yet supreme, and the metaphysical problems are so close at hand that their discussion is imperative. Even in Paul the term Messiah thus had lost its definite meaning and became almost a proper name. Among the Greek Christians this process was complete. Jesus is the "Son of God"; and the great problem of theology becomes explicit. Religion is in our emotions of reverence and dependence, and theology is the intellectual attempt to describe the object of worship. Doubtless the two do not exactly coincide, not only because accuracy is difficult or even impossible, but also because elements are admitted into the definition of God which are derived from various sources quite distinct from the religious experience. Like all concepts the meaning of religious terms is changed with a changing experience and a changing world-view. Translated into the Greek world-view, inevitably the Christian teaching was modified—indeed transformed. Questions which had never been asked came into the foreground, and the Jewish presuppositions tended to disappear. Especially were the Messianic hopes forgotten or transferred to a transcendent sphere beyond death. When the empire became Christian in the 4th century, the notion of a kingdom of Christ on earth to be introduced by a great struggle all but disappeared, remaining only as the faith of obscure groups. Immortality—the philosophical conception—took the place of the resurrection of the body. Nevertheless the latter continues because of its presence in the primary sources, but it is no longer a determining factor, since its presupposition—the Messianic kingdom on earth—has been obscured. As thus the background is changed from Jewish to Greek, so are the fundamental religious conceptions.

The Semitic peoples were essentially theocratic in their religion; they used the forms of the sensuous imagination in setting forth the realities of the unseen world. They were not given to metaphysical speculation, nor long insistent in their inquiries as to the meaning and origin of things. With the Greeks it was far otherwise. For them ideas and not images set forth fundamental reality, and their restless intellectual activity would be content with nothing else than the ultimate truth. The speculation as to the nature of God had led them gradually to separate him by an infinite distance from all creation, and to feel keenly the opposition of the finite and the infinite, the perfect and the imperfect, the eternal and the temporal. To them, therefore, Christianity presented itself not primarily as the religion of a redemption through the indwelling power of a risen saviour, as with Paul, nor even as the solution of the problem how the sins of men could be forgiven, but as the reconciliation of the antimony of the intellect, indicated above. The incarnation became the great truth: God is no longer separated by a measureless distance from the human race, but by his entering into humanity he redeems it and makes possible its ultimate unity with himself. Such lines of thought provoke discussion as to the relationship of Jesus to God the Father, and, at a later period, of the nature of the Holy Spirit who enters into and transforms believers.

Greek philosophy in the second century A.D. had sunk for the most part into scepticism and impotence; its original impulse had been lost, and no new intellectual power took its place; only in Alexandria was there a genuine effort to make the fundamental problems of God and the world. Plato had made God accessible to the highest knowledge as the transcendent idea, remote from the world. For Aristotle, too, God in his essence is far above the world and at most its first mover. The stoics, on the other hand, taught his immanence, while the sceptics sought truth by the minding of the two ideas. They accomplished their purpose in various ways, by distinguishing between God and his power—or by the notion of a hierarchy of super-sensible beings, or in a doctrine which taught that the operations of nature are the movement of pure spirit; or by the use of the "Word" of "Wisdom," half personified as intermediate between God and the world. While these monotheistic, pantheistic doctrines were taught in the schools, the people were left to a debased polytheism and to new superstitions imported from the Orient; the philosophers themselves were by no means unaffected by the popular beliefs. Mingled with all these were the ancient legends of gods and heroes, accepted as inspired scripture by the people, and by philosophers in part explained away by an allegorical exegesis and in part felt increasingly as a burden to the intelligence. In this period of degeneracy there was not the least awakening to religious needs and a profound longing for a new revelation of truth, which should satisfy at once the intellect and the religious emotions.

Christianity came as supplying a new power; it freed philosophy from scepticism by giving a definite object to its efforts and a renewed confidence in its mission. Monothelism henceforth was to be the belief not of philosophers only but even of the ignorant, and in Jesus Christ the union of the divine and the human was effected. The Old Testament, allegorically explained, became the substitute for the outgrown mythology; intellectual activity revived; the new facts gained predominant influence in philosophy, and in turn were shaped according to its canons. In theology the fundamental problems of ontological philosophy were faced; the relationship of unity to multiplicity, of noumenon to phenomena, of God to man. The new element is the historical Jesus, at once the representative of the world. As in philosophy, so also in theology, the easiest solution of the problem was the denial of one of its fundamental truths, and successively these efforts were made, until a solution was found in the doctrine of the Trinity, which satisfied both terms of the equation and became the fundamental creed of the church. Its moulds of thought are those of Greek philosophy, and into these were run the Jewish teachings. We have thus a peculiar combination—the religious doctrines of the Bible, as culminating in the person of Jesus, run through the forms of an alien philosophy.

The Jewish sources furnished the terms Father, Messiah, Son and Spirit. Jesus seldom employed the last term and St. Paul's use of it is not altogether clear. Already in Jewish literature it had been all but personified (cf. the Wisdom of Solomon). Thus the material is Jewish, though already modified doubtless by Greek influence. But the problem is Greek. It is not primarily ethical nor even religious, but it is metaphysical. What is the ontological relationship, between these three factors? The answer is given in the Nicene formula, which is characteristically Greek. By it we perceive how God, the infinite, the absolute, the eternal, is yet not separated from the finite, the temporal, the relative, but, through the incarnation, enters into humanity. We further see how this entering into humanity is not an isolated act but continues in all the children of God by the indwelling spirit. Thus, according to the canons of the ancient philosophy, justice is done to all the factors of our problem—God remains as Father, the infinitely remote and absolute source of all; as Son, the Word who is revealed to man and incarnate in him; as Spirit, who dwells even in our own souls and by his substance unites us to God.

While thus the Greek philosophy furnished the dialectic and the mould for the characteristic Christian teaching, the doctrine of the Trinity preserved religious values. By Jesus the disciples had been led to God, and he was the central fact of faith. After the resurrection he was the object of praise, and soon prayers were offered in his name and to him. Already to the apostle Paul he dominates the world and is above all created things, visible and invisible, so that he has the religious value of God. It is not God as abstract, infinite and eternal, as the far-away creator of the universe, or even as the ruler of the world, which Paul worshiped, but it is God revealed in Jesus Christ, the Father of Jesus Christ, the grace and mercy in Jesus Christ which deliver from evil. Metaphysics and speculative theories were valueless for Paul; he was conscious of a mighty power transforming his own life and filling him with joy, and that this power was identical with Jesus of Nazareth he knew. In all this Paul is the representative of that which is highest and best in early Christianity. Speculation and hyperspiritualization were ever tending to obscure this fundamental religious fact: in the interest of a higher doctrine of God his true presence in Jesus was denied, and by exaggeration of Paul's doctrine of "Christ in us" the significance of the historic Jesus was given up. The Johannine writings,
which presupposed the Pauline movement, are a protest against the hyperspiritualizing tendency. They insist that the Son of God has been incarnate in Jesus of Nazareth, and that our hands have handled and our eyes have seen the word of life. This same purpose, namely, to hold fast to the historic Jesus, triumphed in the doctrine of the Trinity: Jesus was not to be resolved into an aon or into some mysterious tertium quid, neither God nor man, but to be recognized as very God who redeemed the soul. Through him men were to understand the Father and to understand themselves as God's children. Thus the doctrine of the Trinity satisfied at once the philosophic intelligence of scholars and the religious needs of Christians. Only thus can its adoption and ultimate acceptance be explained. Its doctrinal form is the philosophic statement of beliefs held by the common people, who had little interest in theology, but whose faith centred in Jesus. It marks the naturalization of Christianity in the Greek world for the common people who believed in Christ, and for the philosophers who justified the faith to reason.

The historic and religious values of the doctrine of the Trinity may be illustrated by way of contrast. The Mahayana systems are the union of Buddha's teaching with the forms of the Brahman philosophy. The historic Buddha—the man Gautama—is taught as one of a limitless series of incarnations or (better) appearances. For his life on earth with his material body was only an appearance, a seeming, a phenomenon, and simultaneously with its activities the true Buddha existed unmoved and eternal. Thus the way was opened for other apparitional Buddhas, and different sects take different ones as the objects of faith and worship. Moreover, our true nature is also Buddha. The conscious life of all men is appariitional and illusive. Salvation is the comprehension of this fact, and in the apprehension of our essential oneness with the absolute. Hence the way of salvation is by knowledge. In the Mahayana gnosticism was triumphant, and the historic values of Gautama's teaching and personality are lost. The Mahayana illustrates in part what would have followed the triumph of gnosticism in Christianity, for not only would the historic value of the life and teaching of Jesus have been lost, but with it the significance of humanity.

It is apparent that such a doctrine as the Trinity is itself susceptible of many explanations, and minds differently constituted lay emphasis upon its different elements. Especially this true as its Greek terminology was translated into Latin, and from Latin came into modern languages—the original meaning being obscured or disguised, and the original issues forgotten. For some the first thought of God, the infinite and ultimate reality lying beyond and behind all phenomena, predominate. For others the historic manifestation of Jesus becomes only a guide to lead us to that immediate apprehension of God which is the end of theology, and to that immediate union with God which is the end of religion. Such an end is accomplished either by means of pure thought or by a oneness of pure feeling, giving as results the theological or philosophic construction of the concept God, or a mystical ecstasy which is itself at once immediate, inexplicable and indescribable. On the other hand, minds of a different and more concrete character so emphasize the distinctions God, Son and Holy Spirit, that a tritheistic construction appears—three individuals in the one Godhead; these individuals appearing, as for example in the Father and the Son, even in opposition to each other. In general we may say then that the Trinity takes on four differing aspects in the Christian church: in its more common and easily apprehended form, that of God, in its eschatological form, the end towards which the universe is moving, in its historical form, the mystery which is above reason to be accepted by faith, in its philosophic form as the highest reason which solves the ultimate problems of the universe, and finally, as a mode by which the spirit through an emotional content enters into communion with God himself.

To some Christians the doctrine of the Trinity appeared inconsistent with the unity of God which is emphasized in the Scriptures. They therefore denied it, and accepted Jesus Christ, not as incarnate God, but as God's highest creature by whom all else was created, or as the perfect man who taught the true doctrine of God. The first view in the early church long contested with the orthodox doctrine, but finally disappeared, and the second doctrine in the modern church was set forth as easily intelligible, but has remained only as the faith of sects relatively small in number.

Allied with the doctrine of God which seeks the solution of the ultimate problem of all philosophy, the doctrine of salvation has taken the most prominent place in the Christian faith: the doctrine of the cross. It is so prominent, indeed, that to a large portion of believers it has been the supreme doctrine, and the doctrine of the deity of Jesus has been valued only because of its necessity on the effect of the atonement. Jesus alone of the great founders of religion suffered an early and violent death, even the death of a criminal. It became therefore the immediate task of his followers to explain this fact. This explanation was the more urgent because under the influence of Jewish monotheism the rule of God was accepted as an undoubted presupposition, so that the death of Jesus must be in accordance with his will. The early church naturally used the terms and phrases of the prophets. He died the death of a criminal, not for his sins, but for ours. Isaiah lii. was suggested at once and became the central explanation: Christ is the suffering servant who is numbered with the transgressors and who bears the sins of many.

Jesus faced this problem perhaps before the opening of his ministry, certainly from his break with the ecclesiastical authorities. As his violent death drew near, his words indicated how he preserved his deep faith unshaken while yet recognizing the seeming failure of his mission. He devotes himself more exclusively to the little body of his faithful friends and commits his mission to them. As his work is sealed by his death his body is broken and his blood is shed for them. Through this is to come the victory which is denied to his life, as the seed cast into the ground and dead brings forth fruit. Our hints are few of Jesus' teaching, but this much, at least, we cannot doubt unless we suppose that death took him unawares, or that his explanation of the impending fact took on some un-Jewish form; and further, that the earliest tradition misrepresents him. But these hypotheses do not commend themselves, and we accept the tradition that Jesus taught that his death was an atonement for others.

Beyond this the gospel does not go. Why vicarious suffering is needed, or why the God who is the loving Father does not simply forgive, as in the parable of the prodigal son, is not asked. For after all it is not theory which is central, but the fact of the death, and the reason assigned is simply "for others."

In St Paul we find the beginnings of explanation, indeed of two explanations, and in the Epistle to the Hebrews the whole sacrificial system is found to culminate in Christ, of whom all priests and sacrifices are symbols, so that they are abolished with the coming of the great reality.

In the Greek world further questions are raised and the thought of the death as a ransom is prominent. To whom was the ransom paid? For a thousand years the answer was "to the devil." He had gained control of man by man's sin, and Christ set man free. God then, who is love, delivers us from evil through Christ, who pays the penalty of our transgression to the enemy of God and man. There were other theories also, indeed the germs of all later theories existed even in the second century, but this one prevailed. The heretic Marcion taught a variant, namely, the existence of two Gods, one of the Old Testament of law, the other of the New Testament of grace. Christ, unjustly condemned by the God of law, is given as reparation for all men who put their trust in him. From Anselm's time (12th century a. d.) this theory of Marcion's is held for the orthodox substance but is made monotheistic in form. St Anselm denied that any penalty was due to the devil, and in terms of feudal honour restated the problem. The conflict here is in God himself, so to speak, between his immutable righteousness and his limitless grace. In the sacrifice of Jesus these are reconciled. This doctrine of St Anselm's attaches itself readily to texts of St Paul, for his teachings contain undeniably the vicarious propitiatory element.

These theories have to do with the being to whom the ransom is paid or the sacrifice offered. Another group of theories deals
with the effect of the death of Christ upon the sinner. One of these is the so-called governmental theory, wherein the death of Christ is set forth as the savor of good government, so that the forgiveness of sins shall not be thought a sign of laxity. Again, by other theologians the death of Jesus is extolled because of the moral influence it exerts, since Christ's devotion unto death incites a like devotion in us.

Excepting in relatively narrow circles these theories have been seriously studied only by professed theologians. That Christ died for us, and that we are saved by him, is indeed the living truth of the Church in all ages, and a false impression of the fact is given by dwelling upon theories as if they were central. At best they bear only the relationship of philosophy to life.

Another explanation, or (better) system of beliefs, has been far more influential in the Church. Belief in mysterious powers attached to food, feasts, ceremonial rites and sacred things is all but universal. Primitive man seldom connects sacrifice with notions of propitiation, indeed only in highly ethicized religions is the consciousness of sin or of guilt pre-eminent. Sacrifice was believed to exert an influence on the deity which is quasi-physical, and in that sense it is an astronomical belief in mysterious truth. Sometimes, indeed, such contact with deity is thought to be dangerous, and the rites indicate avoid (tabu), and sometimes it is thought desirable.

So universal are such ideas that the problem in particular religions is not its origin but their form. In the Old Testament repeatedly they are found in conflict with the prophetic ideals. Sometimes the prophets denounce them, sometimes ignore them, sometimes attempt to reform and control them. Jesus ignores them, his emphasis being so strong upon the ethical and spiritual that the rest is passed by. In the early Church, still Jewish, the belief in the coming of a mysterious power from God which produced ecstasy and worked wonders. St. Paul also believes in this, but insists that it is subordinate to the peaceable fruits of righteousness. With the naturalization of the Church in the Gentile world ethical ideas became less prominent, and the sacramental system prevailed. By baptism and the Lord's Supper grace is given (ex opere operato), so that man is renewed and made capable of salvation. Already in the 2nd century baptism was described as a bath in which the health of the soul is restored, and the Lord’s Supper as the potion of immortality. Similar notions present in the ethnic faiths take the Christian facts into their service, the belief of the multitude without essential change remaining vague and undefined. While the theologians discussed doctrine the people longed for mystery, as it satisfied their religious natures. By sacraments they felt themselves brought into the presence of God, and to sacraments they looked for aid. Many sacraments were adopted by portions of the Church, until at last the sacred number seven was agreed upon.

As the way of salvation was modified, so too was the idea of salvation: the dream of a Messianic kingdom on earth, with its corollary the resurrection of the physical body, faded away, especially after the Roman empire adopted Christianity. It was no longer the Jewish nation against the heathen empire, for the Jewish nation had ceased to be, and the empire and the Church were one. Salvation henceforth is not the descent of the New Jerusalem out of heaven, but the ascent of the saints to heaven; for them it is not the resurrection of the body but the immortality of the soul. So Jesus is no longer Christ or Messiah, but the Son of God.

These terms again are variously interpreted: heaven is still thought of by many under the imagery of the book of Revelation, and by others it is conceived as a mystical union of the soul with God through the intelligence or of feelings. Yet the older conceptions still continue, Christianity not becoming purely and simply Greek. Again and again individuals and groups turn back to the Semitic cycle of hopes and ideas, while the reconciliation of the two systems, Jewish and Graeco-Roman, becomes the task of exegetes and theologians.

These hopes and theories of salvation, however, do not explain the power of Christianity. Jesus eared himself with the healing of man's physical ailments, and he was remembered as the great physician. Early Christian literature is filled with medical terms, applied (it is true) for the greater part to the cure of souls. The records of the Church are also filled with the efforts of Jesus' followers to heal the diseases and satisfy the wants of man. A vast activity animated the early Church: to heal the sick, to feed the hungry, to succour the diseased, to rescue the fallen, to visit the prisoners, to forgive the erring, to teach the ignorant, were ministries of salvation. A mighty power impelled men to deny themselves in the service of others, and to find in this service their own true life. None the less the first place is given to the salvation of the soul, since, created for an unending existence, it is of transcendent importance. While man is fallen and by nature vile, nevertheless his possibilities are so vast that in comparison the affairs of earth are insignificant. The word, “What shall it profit a man if he gain the whole world and lose his own soul?” comes to mean that the individual soul outvalues the whole world. With emphasis upon God as creator and ruler, and upon man as made in God's image, endowed with an unending existence, and subject to eternal torture if not redeemed, the concept of personality has been exalted at the expense of that of nature, and the future has been magnified at the expense of the present. This future heaven is man's true home, and theology instead of philosophy for natural science is its proper study.

Indeed, intellectual interest centred in religion. Natural science was forsaken, except in so far as it ministered to theology. Because the Old Testament contained references to the origin and the objects of the universe, a certain amount of natural science was necessary, but it was only in this connexion that it had any value. By Augustine's time this process is complete. His writings contain most of the knowledge of his age, but it is strictly subordinate to his theological purpose. Hence, when the barbarians submerged southern Europe, theology alone survived. The Church entered upon a new task. In the beginning Christianity had been the teacher of religion to highly civilized peoples—now it became the civilizing agent to the barbarians, the teacher of better customs, the upholder of law and the source of knowledge. The learned men were monks and priests, the universities were Church institutions, and theology was the queen of the sciences.

The relation of cult to creed is still undetermined. Theoretically the first depends on the second, for its purpose is twofold: the excitation of worthy religious emotions and the attaining of our desires; and how shall these objects be attained unless we know whom we worship and to whom we pray? But it is plausibly maintained that the reverse is true, namely, that theology rests on cult. In the beginnings of consciousness instinctive reactions precede definite thoughts, and even in mature life thoughts often follow acts instead of preceding them. Our religious consciousness is simply our ordinary consciousness obeying its laws. So unceaseful does cultivation grow up that it combines many elements of diverse origin, and is seldom precisely and wholly in accordance with the creed. No doubt the two interact, cult influencing creed and creed modifying cult—cult, perhaps, being most powerful in forming the actual religious faith of the multitude. Cult divides into two unequal parts, the stimulation of the emotions and the control of piety. In the Church service it came early to centre in the sacrament of the Eucharist (q.v.). In the earliest period the services were characterized by extreme freedom, and by manifestations of ecstasy which were believed to indicate the presence of the spirit of God; but as the years went by the original enthusiasm faded away, the cult became more and more controlled, until ultimately it was completely subject to the priesthood, and through the priesthood to the Church. In the Roman communion the structure of the sacred edifice, the positions and attitudes of the priest and the congregation, the order of service, emphasize the mystery and the divine efficacy of the sacrament. The worshipper feels himself in the immediate presence of God, and enters into physical relations with him. Participation in the mass also releases from guilt, as the Lamb of God offered up atones for sin and intercedes
with the Father in our behalf. Thus in this single act of devotion both objects of all cults are attained. As the teaching and person of Jesus were fitted into the framework of the Greek philosophy, and the sacraments into the deeper and broader forms of popular belief, so was the organization shaped by the polity of the Roman empire. Jesus gathered his group of followers and committed to it his mission, and after his resurrection the necessities of the situation brought about the choice of quasi-officials. Later the familiar polity of the synagogue was loosely followed. A complete organization was retarded by two factors, the presence of the apostles and the inspiration of the prophets. But when the apostles died and the early enthusiasm disappeared, a stricter order arose. Practical difficulties called for the enforcement of discipline, and differences of opinion for authority in doctrine; and, finally, the sacramentarian system required a priesthood. In the 2nd century the conception of a Catholic Church was widely held and a loose embodiment was given it; after the conversion of the empire the organization took on the official forms of the empire. Later it was modified by the rise of the feudal system and the re-establishment of the modern European nations. (See History.)

The polity of the Church was more than a formal organization; it touched the life of each believer. Very early, Christianity was conceived to be a new system of law, and faith was interpreted as obedience. Legalism was joined with sacramentarianism, doubling the power of the priest. Through him Church discipline was administered, a complete system of ecclesiastical penalties, i.e., penance, growing up. It culminated in the doctrine of purgatory, a place of discipline, of purifying suffering after death. The Roman genius for law strengthened and systematized this tendency.

The hierarchy which centres in the pope constitutes the Church of which the sacramental system is the inner life and penance is the sanction. It is thus a divine-human organization. It teaches that the divine-human Son of God established it, and returning to heaven committed to the apostles, especially to St Peter, his authority, which has descended in an unbroken line through the popes. This is the charter of the Church, and its acceptance is the first requisite for salvation; for the Church determines doctrine, exercises discipline and administers sacraments. Its authority is accompanied by the spirit of God, who guides it into truth and gives it miraculous power. Outside the Church there are only the "broken lights" of man's philosophy and the vain efforts of weak human nature after virtue.

Christianity in its complete Roman development is thus the coming of the supernatural into the natural. The universe falls into these orders, the second for the sake of the first, as nature is of, and for God. Without him nature at its highest is like a beautiful statue, void of life; it is of secondary moment compared even to men, for while it passes away he continues for ever. He is dependent, therefore, not upon nature, but upon God's grace for salvation, and this comes through the Church. In the book of Revelation the New Jerusalem descending from heaven to the earth may be taken as a symbol of a continuing process; the human receives the divine, as the Virgin Mary received the Holy Spirit and brought forth Jesus, perfect man and perfect God. Thus the Church ever receives God and has a twofold nature; its sacraments through material and earthly elements impart a divine power; its teachings agree with the highest truths of philosophy and science, yet add to these the knowledge of mysteries which eye hath not seen, nor ear heard, neither hath it entered into the heart of man to conceive; it sanctifies human relationships, but the happiness of earth at purest and best is only a shadow of the divine bliss which belongs to the redeemed soul. Hence man should deny the world for the sake of the other world, and the title "religious" belongs distinctly to the monastic and priestly life. Theology is the queen of the sciences, and nothing should be taught in school or university which contradicts its conclusions. Moreover, nothing should be done by the state which interferes with the transcendental interest committed to the Church. Thus the Church touches and controls all realms of life, and the cycle is complete. It began as separate from the world and proscribed by it; next it adapted itself to the learning, the customs and the polity of the world. Finally it asserted its mastery and assumed sovereign power over all. The Church in its completed form was the outcome of a long development; if the seed was Jewish the environment was Gentile. Into the full tree were gathered the effects, not only of the initial energy, but of the forces of earth, air, water and sun. The Roman Church expressed the beliefs and answered the needs of the people, and this explains in part both its forms and its power, its long continuance and wide supremacy.

The Church was never completely successful in unifying its organization. In part it shared the destiny of the Roman empire, and with it fell into two parts, East separating from West. Indeed the East never really acknowledged the Roman primacy nor shared in its development, and it still remains apart. With characteristic oriental conservatism it claims the title of "Orthodox," and retains the creed and organization of the early Church. In general its conception of the relation of the world to the super-world is identical with that of the Roman Church, though somewhat less defined, as its organization is less complete. It has remained in the second stage mentioned above; established, as in Russia, by the empire, it is dependent upon it and in alliance with it. In the Mahomedan dominions it has been recognized as a state within the state, and in these communities faith and patriotism are one.

The idea of the Roman Church was imperfectly embodied at the best; the divine gift was in earthy vessels. The world was never completely cast out; indeed the Church became the scene for ambition and the home of luxury and pleasure. It was entangled also in the political strife of the feudal ages and of the beginning of modern empires. Its control of the sciences embroiled it with its own philosophers and scholars, while saints and pure-minded ecclesiastics attempted, without success, its reform from within. Finally, through Luther, the explosion came, and western Christendom broke into two parts: the Catholic and Protestant.

Protestantism in its primary principle is the return to primitive Christianity. The whole development which we have traced, culminating in the ecclesiastical-doctrinal system of the Roman Church, is regarded as a corruption, since foreign and even heathen elements have been brought in, so that the religion established by Christ is obscured or lost. For Protestants the Bible only now becomes the infallible, inspired authority in faith and morals. Interpretations by the Fathers or by the councils are to be taken only as aids to its understanding. With this principle is associated a second, the liberty of the individual; he reads the sacred Scriptures and interprets them for himself without the intervention of priests or church; and he enters by faith in Christ into communion with God, so that all believers are priests. Here may be noted a fundamental difference in the psychology of religion, since in the Roman Church the chief appeal is to the emotions, while in the Reformed it is to the intelligence. Yet this appeal to the intelligence is not rationalism; the latter makes reason the supreme authority, rejecting all which does not conform to it; the Bible is treated like any other book, to be accepted or rejected in part or in whole as it agrees with our canons of logic and our general science, while religion submits to the same process as do other departments of knowledge. But in Protestantism reason and the light of nature are in themselves as impotent as in the Roman Church. The Bible interpreted by man's unaided intelligence is as valueless as other writings, but it has a sacramental value when the Holy Spirit accompanies its teaching, and the power of God uses it and makes the soul capable of holiness. In all this the supernatural is as vividly realized as in the Roman Church; it is only its mediation which is different. These principles are variously worked out in the different churches and variously expressed. In part because of historical circumstances, the divergence from the older systems is more marked in some Protestant churches than in others, yet on the
CHRISTIANITY

whole these two principles determine cult and in part organization. As in the Roman Church cult centres in the mass, so in the Reformed Church it centres in the sermon. The Holy Spirit, the determining factor in the religious life, uses the Bible as his means, and calls the intelligence into action. The clergyman is primarily the preacher, renewed by God's power and enlightened by the Spirit, so that he speaks with divine authority. The ancient Jewish prophetic office is revived, yet with a difference: the ancient prophets acknowledged no external authority, but the Protestant preacher is strictly subordinate to the Scriptures of which he is the interpreter. Beside the sermon the sacraments are observed as established by Christ—two in number, baptism and the Lord's Supper. But these do not exert a quasi-physical or magical influence, ex opere operato. Unless there be faith in the recipient, an understanding of the meaning of the sacrament and an acceptance of it, it is valueless or harmful. Prayer and praise also are effective only as the congregation intelligently join in them; hence they are not to be solely by a priest nor in a strange tongue, as the clergyman is simply the leader of the devotions of the people. In large portions of the Church also opportunity for the free expression of the religious experience of the laity is found.

The emphasis upon the believer and his freedom from all external authority do not result in a thoroughgoing individuality. Luther too was held to the unity of all Christians, and Protestants are agreed in this. For them, as for the Roman Church, there is a belief in a catholic or all-embracing Church, but the unity is not that of an organization; Christians are one through an indwelling spirit; they hold the same faith, undergo the same experience and follow the same purpose. This inner life constitutes the oneness of believers and forms the true Church which is invisible. It expresses itself in outward forms, yet there are not two Churches visible and invisible, but only one. The spiritual experience of the individual utterts itself in words, and desires association with others who know the same grace. There is formed a body of teaching in which all agree, and an organization in which the common experience finds expression and aid. While then membership in this organization is not primary, it assumes a higher and even a vital importance, since a true experience recognizes the common faith and the common fellowship. Were it to refuse assent to these, doubt would be thrown upon its own trustworthiness.

Historically these principles were only in part embodied, for the Reformation was involved in political strife. The Reformers turned too frequently to armed force and power, and throughout Europe turmoil and war ensued. In consequence, in the Protestant nations the state assumed the ultimate authority over the Church. Moreover, in the early days of the Reformation the Catholic Church charged it with a lawless individualism, a charge which was seemingly made good by an extreme divergence in theological opinion and by riots in various parts of the Protestant world. The age was indeed one of ferment, so that the foundations of society and of religion seemed threatened. The Reformers turned to the state for protection against the Roman Church, and ultimately as a refuge from anarchy, and they also returned to the theology of the Fathers as their safeguard against heresy. Instead of the simplicity of Luther's earlier writings, a dogmatic theology was formed, and a Protestant ecclesiasticism established, indistinguishable from the Roman Church in principle. The main difference was in the attitude to the Roman allegiance and to the sacramentary system. There was thus by no means a complete return to the Bible as the sole authority, but the Bible was taken as interpreted by the earlier creeds and as worked into a doctrinal system by the scholastic philosophy. Thus Protestantism also came to identify theology with the whole range of human knowledge, and in its official forms it was as hostile to the progress of science as was the Roman Church itself.

Many Protestants rebelled against this radical departure from the principles of the Reformation and of Biblical Christianity. To them it seemed the substitution of the authority of the Church for the authority of a living experience and of intellectual adherence to theological propositions for faith. The freedom of the individual was denied when the state enforced religious conformity. Thus a struggle within Protestants arose, with persecutions of Protestants by Protestants. Moreover, many failed to find the expression of their faith in the official creed or in the established organization, and Protestantism divided into many sects and denominations, founded upon special types of religious experience or upon particular points in doctrine or in cult. Thus Protestantism presents a wide diversity in comparison with the regularity of the Roman Church. This we should expect indeed from its insistence upon individual freedom; yet, notwithstanding certain notable exceptions, amid the diversity there is a substantial unity, a unity which in our day finds expression in common organizations for great practical ends, for example in the "Bible Societies," "Tract Societies," the "Young Men's Christian Associations," "Societies of Christian Endeavour," &c., which disregard denominational lines.

The coming of the northern peoples into the Roman world profoundly modified Christianity. It shared indeed in the dreariness and corruption of the times commonly called Christendom the "dark ages," but when at last a productive period began the Church was the first to profit by it. Since all educated men were priests, it assimilated the new learning. The experience of Protestantism—and continued its control of humanities. In the 13th century, it was supreme, and Christianity was identified with world systems of knowledge and politics. Both were deemed alike divine in origin, and to their validity was an offence against God. Christianity thus had passed through three stages in politics as in science. At first it was persecuted by the state, then established by it, and finally dominated over it; so its teaching was at first alien to philosophy and despised by it, next was accepted by it and given form and rights through it, and finally became queen of the sciences as theology and ruled over the whole world of human knowledge. But the triumph by its completeness ensured new conflicts; from the disorder of the middle ages arose states which ultimately asserted complete autonomy, and in like fashion new intellectual powers came forth which ultimately established the independence of the sciences.

In the broadest sense the underlying principle of the struggle is the reassertion of interest in the world. It is no longer merely the scene for the drama of the soul and God, nor is man independent of it, but man and nature constitute an organism, humanity being a part of the vaster whole. Man's place is not even central, as he appears a temporary inhabitant of a minor planet in the vaster sphere of the lower stellar systems. Every science is involved, and theology has come into conflict with metaphysics, logic, astronomy, physics, chemistry, geology, zoology, biology, history and even economics and medicine. From the modern point of view this is unavoidable and even desirable, since "theology" here represents the science of the 13th century. As in the political world the states gained first the undisputed control of matters secular, rejecting even the prorfered counsel of the Church, and then proceeded to establish their sovereignty over the Church itself, so was it in the empire of the mind. The rights gained for independent research were extended over the realm of religion also; the two indeed cannot remain separate, and man must subordinate knowledge to the authority of religion—or make science supreme, submitting religion to its scrutiny and judging it like other phenomena. Under this investigation Christianity does not appear altogether exceptional. Its early logic, ontology and cosmology, with many of its distinctive doctrines, are shown to be the natural offspring of the races and ages which gave them birth. Put into their historical environment they are freed from adverse criticism, and indeed valued as steps in the intellectual development of man's mind. Advanced science, however, as a guide to man they are put aside as anachronisms not worthy of dispute. The Bible is studied like other works, its origins discovered and its place in comparative religion assigned. It does not appear as altogether unique, but it is put among the other sacred books. For the great religions of the world show similar cycles of development,
similar appropriations of prevalent science and philosophy, similar conservative insistence upon ancient truth, and similar claims to an exclusive authority.

With this interest is involved an attitude of mind toward the supernatural. As already pointed out, nature and supernatural were taken as physically and spatially distinct. The latter could descend upon the former and be imparted to it, neither subject to nature nor intelligible by reason. In science the process has been reversed; nature ascends, so to speak, into the region of the supernatural and subdues it to itself; the marvellous or miraculous is brought under the domain of natural law, the canons of physics extend over metaphysics, and religion takes its place as one element in the natural relationship of man to his environment. Hence the new world-view threatens the foundations of the ecclesiastical edifice. This revolution in the world-view is no longer the possession of philosophers and scholars, but the multitude accepts it in part. Education in general has rendered many familiar with the teachings of science, and, moreover, its practical benefits have given authority to its maxims and theories. The world’s problem is not only therefore acute, but the demand for its solution is wider than ever before.

The Roman Catholic Church uncompromisingly reasserts its ancient propositions, political and theological. The cause is lost indeed in the political realm, where the Church is obliged to submit, but it protests and does not waive or modify its claims (see the Syllabus of 1864, paragraphs 19 ff., 27, 54 and 53). In the Greek and Protestant churches this situation cannot arise, as they make no claims to governmental sovereignty. In the intellectual domain the situation is more complex. Again the Roman Church unhesitatingly reaffirms the ancient principles in their extreme form (Syllabus, paragraphs 8-9-13; Decrees of the Vatican Council, chapter 4, note especially canon 4-2). The works of St Thomas Aquinas are recommended as the standard authority in theology (Encyc. of Leo XIII., December 7, 1903, No. 5; Aug. 4, 1879).

In details and few conclusions of modern science are rejected, as for example the origin of man from lower species, and, in a different sphere, the conclusions of experts as to the origins of the Bible. Faith is defined as “asent upon authority,” and the authority is the Church, which maintains its right to supremacy over the whole domain of science and philosophy.

The Greek Church remains untouched by the modern spirit, and the Protestant Churches are also bound officially to the scholastic philosophy of the 17th century; their confessions of faith still assert the formation of the world in six days, and require assent to propositions which can be true only if the old cosmology be correct. Officially then, the Church identifies Christianity with the position outlined above, and hostile critics agree to this identification, rejecting the faith in the name of philosophic and scientific truth.

On the other hand there are not wanting individuals and even large bodies of Christians who are intent upon a reformulation. Even in the official circles of the Church, not excepting the Roman Church, there are many scholars who find no difficulty in remaining Christian while accepting the modern scientific view of the world. This is possible to some because the situation in its sharp antithesis is not present to their minds: by making certain compromises on the one side and on the other, and by framing private interpretations of important dogmas, they can retain their faith in both and yet preserve their mental integrity. A large literature is produced, reconciling science and theology by softening and compromising and adapting; a procedure in accordance with general historical development, for men do not love sharp antagonisms, nor are they prepared to carry principles to their logical conclusions. By a fortunate power of mind they are able to believe as truths mutually inconsistent propositions.

Thus the issue is not altogether acute as it might seem. No genuine situation lives or dies by logic. Christianity rests on great religious needs which it meets and gratifies, so that its life (like all other lives) is in unratinalized emotions. Reason seeks ever to rationalize these, an attempt which seems to destroy yet really fulfills. As thus the restless reason tests the emotions of the soul, criticizes the traditions to which they cling, rejects the ancient dogmas in which they have been defined, the Church slowly participates in the process: silently this position and that are forsaken, legends and beliefs once of prime importance are forgotten, or when forced into controversy many ways are found by which the old and the new are reconciled: the sharpness of distinctions can be rubbed off, expressions may be softened, definitions can be modified and half-way resting-places afforded, until the momentous transition has been made and the continuity of tradition is maintained. Finally, as the last step, even the official documents may be revised. Such a process in Christianity is everywhere in evidence, for even the Roman Church admits the modern astronomy. So too it accepts the changes in the world of politics with qualified approval. In the Syllabus of 1864 the separation of state and church was anathematized, yet in 1906 this separation in the United States was held up as an example and followed by the French government. In the Protestant Churches the process is precisely similar. No great church has yet modified its articles of religion so as to admit, for example, that the Garden of Eden was not a definite place where Eve was tempted, yet the doctrine is contradicted with approval by individuals, and the results of modern science are accepted and taught without rebuke. In all this the Church shows its essential oneness with other organizations of society, the government, the family, which are at once deeply rooted in the past, and yet subject to the influences of the present.

For Christianity is by no means wholly intellectual, nor chiefly so. It would be fully as true to facts to describe this religion as a vast scheme for the amelioration of the condition of humanity. In education, in care for the sick, the poor, the outcast, it has retained the spirit of its Lord. Though it has at times denied this spirit, been guilty of crimes, persecutions, wars and greed—still the Church has never quite forgotten him who went about doing good, who thus justified himself from the contagion of his example. No church has been so responsive to the needs of man as our own; whatever doubts men have as to the doctrines or the cults there is an agreement wider than in the past in the good works whose inspiration is a divine love.

Yet the intellectual crisis cannot be ignored in the interest of the practical life. Men must rationalize the universe. On the one hand there are churchmen who attempt to repeat the historical process which has naturalized the Church in alien soils by appropriating the forces of the new environment, and who hold that the entire process is inspired and guided by the spirit of God. Hence Christianity is the absolute religion, because it does not preclude development but necessitates it, so that the Christianity that is to come shall not only retain all that is important in the Christianity of the past and present but shall assimilate new truth. On the other hand, there are those who would regard Christianity as a blend beneath which is discernible a system preparatory to the historic forms. In part under the influence of the Hegelian philosophy, and in part because of the prevalent evolutionary scientific world-view, God is represented under the form of pure thought, and the world process as the unfolding of himself. Such truth can be apprehended by the multitude only in symbols which guide the will through the imagination, and through historic facts which are embodiment of ideas. The Trinity is the essential Christian doctrine, the historic facts of the Christian religion being the embodiment of religious ideas. The chief critical difficulty felt by this school is in identifying any concrete historic fact with the unchanging idea, that is, in making Jesus of Nazareth the incarnation of God. God is reinterpreted, and in place of an extra-mundane creator is an omnipresent life and power. The Christian attainment is nothing else than the thorough intellectual grasp of the absolute idea and the identification of our essential selves with God. With a less thoroughgoing intellectulism, some scholars re-interpret Christianity in terms of current scientific phraseology. Christianity is dependent upon the understanding of the universe; hence it is the duty of believers to put it into the new setting, so that it adopts and adapts astronomy, geology, biology and
of any age or church to the name Christian. This school also represents historic Christianity, and maintains the continuity of the Christian faith through all the ages past with Christ himself. But this continuity is not then in theological systems or creeds, nor in sacraments and cult, nor in organization, but in the noble company of all who have lived in simple trust in God and love to humanity. It is this true Church of the spirit and purpose of Jesus which has been the supreme force for the uplifting of humanity.

Christianity has passed through too many changes, and it has found too many interpretations possible, to fear the time to come. Thoroughgoing reconstruction in every item of theology and in every detail of polity there may be, yet shall the Christian life go on—the life which finds its deepest utterance in the words of Christ, “Thou shalt love the Lord thy God with all thy heart and thy neighbour as thyself”; the life which expresses its profoundest faith in the words Christ taught it to pray, “Our Father”; the life which finds its highest rule of conduct in the words of its first and greatest interpreter, “Let this mind be in you which was also in Christ Jesus our Lord.”

**Bibliography.**—Detailed bibliographies accompany the separate articles on the subjects connected with the Christian religion and Church. In the following list a selection is given of books on the wider and general subject:

- **Protestantism.**—John Calvin, *Institutio Religionis Christianae* (1536; Eng. trans., 1816); Charles Hodge, *Systematic Theology* (3 vols., 1873); Ernst Troeltsch, *Die Absoluthit der Christentums* (1902); *Geschichte der politischen Ideen, seit Anfängen der Revolution* (1878); *Geschichte der politischen Ideen, seit der Revolution* (Eng. trans., 1888, especially volumes 3 and 4); Newman Smyth, *Old Faiths in New Lights* (1879); *Through Science to Faith* (1902); Henry Drummond, *The Ascend of Man* (1894); William Ralph Inge, *Christian Mysticism* (Bampton Lectures, 1894); Wilhelm Herrmann, *The Communion of the Christian with God* (1895); George William...
CHRISTIANSAND—CHRISTINA

Knox, Direct and Fundamental Proofs of the Christian Religion (1903); Albrecht Ritschl, Die christliche Lehre von der Rechtfertigung und Versöhnung (1900).

CHRISTIANSAND (KRISTIANSAND), a fortified seaport of Norway, the chief town of a diocese (stift), on a fjord of the Skagerrack, 175 m. S.W. of Christiania by sea. Pop. (1900) 14,701. It stands on a square peninsula flanked by the western and eastern harbours and by the Otter river. The situation, with its wooded hills and neighbouring islands, is no less beautiful than that of other south-coast towns, but the substitution of brick for wood as building material after a fire in 1802 made against the picturesque of the town. There is a fine cathedral, rebuilt in Gothic style after a fire in 1858. Christiansand is an important fishing centre (salmon, mackerel, lobsters), and sawmills, shipbuilding yards and mechanical works are the principal industrial works. The port is the largest on the south coast, and all the coast steamers, and those serving Christiania from London, Hull, Grangemouth, Hamburg, &c., touch here. The Saetersdal railway follows that valley north to Byglandsfiord (48 m.), whence a good road continues to Viken i Valle at the head of the valley. Fleskerø, a neighbouring island, is a favourite pleasure resort. The town was founded in 1641 by Christian IV., after whom it was named.

CHRISTIAN SCIENCE, a system of theosophic and therapeutic doctrine, which was originated in America about 1866 by Mrs. Mary Baker Eddy, and has in recent years obtained a number of adherents both in the United States and in European countries. Mrs. Eddy (1821–1910; see Baker) was born near Concord, New Hampshire; in 1843 she married Colonel G. W. Glover (d. 1844), in 1853 she married Daniel Patterson (divorced 1873), and in 1877 Dr. Asa Gilbert Eddy (d. 1887). Mrs. Eddy spent nearly the year's time in a hospital; for years she worked as a helper by mind-cure. She based her teaching on the Bible, and in the principles that man's essential spirit is eternal, and that, the Spirit of God being Love and Good, moral and physical evil are contrary to that Spirit, and represent an absence of the True Spirit which was in Jesus Christ. There is but one Mind, one God, one Christ, and nothing real but Mind. Matter and sickness are subjective states of error, delusions which can be dispelled by the mental process of a true knowledge of God and Christ, or Christian science. Ordinary medical science—using drugs, &c.—is therefore irrelevant; spiritual treatment is the only cure of what is really mental error. Jesus himself healed by those means, which were therefore natural and not miraculous, and promised that those who believed should do curative works like his. In 1876 a Christian Scientist Association was organized. Mrs. Eddy had published in the preceding year a book entitled Science and Health, with Key to the Scriptures, which has been adopted and is the gospel of Christian Science. In 1879 she became the pastor of a “Church of Christ, Scientist,” in Boston, and also founded there the “Massachusetts Metaphysical College” (1881; closed 1889) for the furtherance of her tenets. The first denominational chapel outside Boston was built at Oconto, Wisconsin, in 1886; and in 1894 (enlarged and reconstructed in 1906) a great memorial Church was erected in Boston. Mrs. Eddy's publications also include Retrospection and Introspection (1881), Unity of Good and Unreality of Evil (1887), Rudimental Divine Science (1891), Christian Healing (1886), &c. The progress of the cult of Christian Science has been remarkable, and by the beginning of the 20th century many hundreds of Christian Science churches had been established; and the new religion found many adherents also in England. A purely local and congregational form of government was adopted, but Christian Scientists naturally looked to the mother church in Boston, with Mrs. Eddy as its guiding influence, as their centre. A monthly magazine, The Christian Science Sentinel, is published officially in Boston.

The profession of the paid Christian Science “healer” has been very prominent in recent years both in America and in England; and very remarkable successes have been claimed for the treatment. In some serious cases of death after illness, where a coroner's inquest has shown that the only medical attendance was that of a Christian Science “healer,” the question of criminal responsibility has been prominently canvassed; but an indictment in England against a healer for manslaughter in 1906 resulted in an acquittal. The theosophic and the medical aspects of Christian Science may perhaps be distinguished; but the latter in all events is open to grave abuse. But the modern reaction in medical practice against drugs, and the increased study of the subject of “suggestion,” have done much to encourage a belief in faith-healing and in “psychotherapy” generally.

In 1898, indeed, a separate movement (Emmanuel), inspired by the success of Christian Science, and also emanating from America, was started within the Anglican Communion, its object being to bring prayer to work on the curing of disease; and this movement obtained the approval of many leaders of the church in England.

An “authorized” Life of Mrs. Eddy, by Sibyl Wilbur (1908), deals with the subject acceptably to her disciples. "Georgine Milmine’s” Life of M. B. G. Eddy, and History of Christian Science (1909, though not so acceptable, is a judicious critical account. A detailed work against the whole system, by a competent English doctor (Stephen Pughet), will be found in The Faith and Works of Christian Science (1909).

CHRISTIANSUND (KRISTIANSUND), a seaport on the west coast of Norway, in Romsdal amt (county), 259 m. N.E. by N. of Bergen, in the latitude of the Faeroe Islands. Pop. (1901) 11,982. It is built on four small islands, by which its harbour is enclosed. The chief exports are wood, cod, herrings and fish-products, and butter to Great Britain. The town is served by the principal steamers between the south Norwegian ports, Hull, Hamburg, &c., and Trondheim, and it is the chief port of the district of Nordmøre. Local steamers serve the neighbouring fjords, including the island of Olen, which at Sundsvall then a driving road past the fine Dovefield connects with the Gudbrandsdal route. Till 1742, when it received town privileges from Christian VI., Christiansund was called Lille-Fosen.

CHRISTIE, RICHARD COLEYE (1830–1901), English scholar and bibliophile, was born on the 22nd of July 1830 at Lenton in Nottinghamshire, the son of a millowner. He was educated at Lincoln College, Oxford, and was called to the bar at Lincoln's Inn in 1857, and in 1872 became chancellor of the diocese of Manchester. This he resigned in 1893. He held numerous appointments, notably the professorships of history (from 1854 to 1856) and of political economy (from 1855 to 1866) at Owens College, Manchester. He always took an active interest in this college, of which he was one of the governors; in 1893 he gave the Christie library building designed by Alfred Waterhouse, and in 1897 he devoted £50,000 of the funds at his disposal as a trustee of Sir Joseph Whitworth's estate for the building of Whitworth Hall, which completed the front quadrangle of the college. He was an enthusiastic book collector, and bequeathed to Owens College his library of about 75,000 volumes, rich in a very complete set of the books printed by Dolet, a wonderful series of Aldines, and of volumes printed by Sebastian Gryphius. His Étienne Dolet, the Martyr of the Renaissance (1880), is the most exhaustive work on the subject. He died at Ribben on the 9th of January 1901.

CHRISTINA (1626–1689), queen of Sweden, daughter of Gustavus Adolphus and Maria Eleonora of Brandenburg, was born at Stockholm on the 8th of December 1626. Her father died when she was only six years old. She was educated, principally, by the learned Johannes Matthiae, in as masculine a way as possible, while the great Oxenstjerna himself instructed her in politics. Christina assumed the sceptre in her eighteenth year (Dec. 8, 1644). From the moment when she took her seat at the head of the council board she impressed her veteran counsellors with the conviction of her superior genius. Axel Oxenstjerna himself said of her, when she was only fifteen: “Her majesty is not like women-folk, but is stout-hearted and of a good understanding, so that, if she be not corrupted, we have
The Swedish plenipotentiaries were Johan Oxenstierna, the chancellor's son, and Adler Salvius. From the first the relations between them were strained. Young Oxenstierna, haughty and violent, claimed, by right of birth and rank, to be caput legationis. The chancellor, at home, took his son's part, while Salvius was warmly supported by Christina, who privately assured him of her exclusive favour and encouraged him to hold his own. She did not take the fact of her union, which was made in full sense between the queen and the chancellor; and she urged Salvius to accelerate the negotiations, against the better judgment of the chancellor, who hoped to get more by holding out longer.

The longer Christina ruled, the more anxious for the future fate of her empire grew the men who had helped to build it up. Yet she gave fresh privileges to the towns; she encouraged trade and manufactures, especially the mining industries of the Dales; in 1649 she issued the first school ordinance for the whole kingdom; she encouraged foreign scholars to settle in Sweden; and native science and literature, under her liberal encouragement, flourished as if they had never flourished before. In one respect, too, she showed herself wiser than her wisest counsellors. The senate and the estates, naturally anxious about the succession to the throne, had repeatedly urged her majesty to marry, and had indicated her cousin, Charles Gustavus, as her most bending consort. Weary of their importunities, yet revolting at the idea of submission to any member of the opposite sex, Christina settled the difficulty by appointing Charles her successor, and at the Riksdag of 1650 she declared that the crown belonged to Charles and his heirs male. In the summer of 1651 Christina was, with difficulty, persuaded to reconsider her resolution to abdicate, but three years later the nation had become convinced that her abdication was highly desirable, and the solemn act took place on the 6th of July 1654 at the castle of Upsala, in the presence of the estates and the great dignitaries of the realm. Many were the causes which predisposed her to what was, after all, anything but an act of self-renunciation. First of all she could not fail to remark the increasing discontent with her arbitrary and wasteful ways. Within ten years she had created 17 counts, 46 barons and 428 lesser nobles; and, to provide these new peers with adequate appanages, she had sold or mortgaged crown property representing an annual income of 1,200,000 rix-dollars. Signs are also not wanting that Christina was growing weary of the cares of government; while the importance of the senate and Riksdag on the question of her marriage was a constant source of irritation. In retirement she could devote herself wholly to art and science, and the opportunity of astonishing the world by the unique character of a great queen, in the prime of life, voluntarily resigning her crown, strongly suggested itself to her vivid imagination. Anyhow, it is certain that, towards the end of her reign, she behaved as if she were determined to do everything in her power to make herself as little missed as possible. From 1651 there was a notable change in her behaviour. She cast away every regard for the feelings and prejudices of her people. She ostentatiously exhibited her contempt for the Protestant religion. Her foreign policy was flighty to the verge of foolishness. She contemplated an alliance with Spain, a state quite outside the orbit of Sweden's influence, the firstfruits of which were to have been an invasion of Portugal. She utterly neglected affairs in order to plunge into a whirl of dissipation with her foreign favourites. The situation became impossible, and it was with an intense feeling of relief that the Swedes saw her depart, in masculine attire, under the name of Count Dohna. At Innsbruck she openly joined the Catholic Church, and was rechristened Alexandrina. In 1656, and again in 1657, she visited France, on the second occasion ordering the assassination of her major-domo Monaldisch, a crime still unexplained. Twice she returned to Sweden (1656 and 1657) in the vain hope of recovering the succession, finally settling in Rome, where she died on the 19th of April 1689, poor, neglected and forgotten.

Taylor, Christina of Sweden (1909).

Christina [Maria Christina Henrietta Désirée Félicité Rénée], for some years queen-regent of Spain (1798–
1808), widow of Alphonso XII, and archduchess of Austria (1797–1882), was born at Gross Seelowitz, in Austria, on the 21st of July 1788, being the daughter of the archduke Charles Ferdinand and the archduchess Elizabeth of Austria. She was brought up by her mother as a rigid Catholic, and great care was taken with her education. At eighteen she was appointed by the emperor Francis Joseph, abbess of the House of Noble Ladies of St. Theresa in Prague, where she made herself very popular and distinguished herself by her intellectual parts. It is said that at the court of Vienna the archduchess saw the young prince Alphonso of Spain when he was only a pretender in exile, before the restoration of the Bourbons. A few years later, when Alphonso XII. had lost his first wife and cousin, Queen Mercedes, daughter of the duc de Montpensier, his ministers, especially Señor Canovas, urged him to marry again. He told them that if he did so it would only be with the young Austrian archduchess Maria Christina. After some negotiations between the two courts and governments it was agreed that the archduchess Elizabeth and her daughter should meet Alphonso XII. at Arcachon, in the south of France, where a few days' personal acquaintance was sufficient to make both come to a decision. The Duke of Arenbury's daughter, Dona Maria Theresa, was born at Madrid, on the 24th of November 1805; in the throne-room of the Imperial palace, the archduchess solemnly abdicated all her rights of succession in Austria, in accordance with the law obliging all princesses of the imperial house to do so when they wed a foreign prince. On the 17th of November the archduchess and her mother, with a numerous suite, started for Spain, arriving at the royal castle of El Pardo, near Madrid, on the 24th of November. The wedding took place in the Atocha cathedral, on the 29th of November, in great state, and was followed by splendid festivities. Queen Christina bore her husband two daughters before he died in 1885—Dona Mercedes, born on the 11th of September 1880, and Dona Maria Theresa, born on the 12th of November 1882. During her husband's lifetime the young queen kept studiously apart from politics, so much so that her inexperience caused much anxiety in November 1885, when she was called upon to take the arduous duties of regent. During the long minority of the posthumous son of Alphonso XII., afterwars King Alphonso XIII., the Austrian queen-regent acted in a way that obliged even the adversaries of the throne and dynasty to respect the mother and daughter. The Spanish upper classes and political and military politicians, found that the gloved hand of their constitutional ruler was that of a strong-minded and tenacious regent, who often asserted herself in a way that surprised them much, but always, somehow, enforced obedience and respect. More could not be done by a foreign ruler from a nation little prone to waste attachment or demonstrative loyalty upon anybody not Castilian born and bred.

Christison, Sir Robert, Bart. (1797–1882), Scottish toxicologist and physician, was born in Edinburgh on the 18th of July 1797. After graduating at the University of that city in 1819, he spent a short time in London, studying under John
Abernethy and Sir William Lawrence, and in Paris, where he learnt analytical chemistry from P. J. Robiquet and toxicology from M. J. B. Orfila. In 1822 he returned to Edinburgh as professor of medical jurisprudence, and set to work to organize the subject of a sound basis. On poisons in particular he speedily became a high authority; his well-known treatise on them was published in 1829, and in the course of his inquiries he did not hesitate to try such daring experiments on himself as taking large doses of Calabar bean. His attainments in medical jurisprudence and toxicology procured him the appointment, in 1829, of medical officer to the crown in Scotland, and from that time till 1866 he was called as a witness in many celebrated criminal cases. In 1832 he gave up the chair of medical jurisprudence and accepted that of medicine and therapeutics, which he held till 1877; at the same time he became professor of clinical medicine, and continued in that capacity till 1885. His fame as a toxicologist and medical jurist, together with his work on the pathology of the kidneys and on fevers, secured him a large private practice, and he succeeded to a fair share of the honours that commonly attend the successful physician, being appointed physician to Queen Victoria in 1848 and receiving a baronetcy in 1871. Among the books which he published were a treatise on *Granulare Degeneration of the Kidneys* (1839), and a *Commentary on the Pharmacopoeia of Great Britain* (1842). Sir Robert Christison, who retained remarkable physical vigour and activity down to extreme old age, died at Edinburgh on the 23rd of January 1882.

See the *Life by his sons* (1885-1886).

**CHRISTMAS** (i.e. the Mass of Christ), in the Christian Church, the festival of the nativity of Jesus Christ. The history of this feast coheres so closely with that of Epiphany (q.v.), that what follows must be read in connexion with the article under that heading.

The earliest body of gospel tradition, represented by Mark no less than by the primitive non-Marcan document embodied in the first and third gospels, begins, not with the birth and childhood of Jesus, but with his baptism; and this order of accretion of gospel matter is faithfully reflected in the time order of the invention of feasts. The great church adopted Christmas much later than Epiphany; and before the 5th century there was no general consensus of opinion as to when it should come in the calendar, whether on the 6th of January, or the 25th of March, or the 25th of December.

The earliest identification of the 25th of December with the birthday of Christ is in a passage, otherwise unknown and probably spurious, of Theophilus of Antioch (A.D. 171-183), preserved in Latin by the Magdeburg centurians (i. 3, 118), to the effect that the Gauls contended that as they celebrated the birth of the Lord on the 25th of December, whatever day of the week it might be, so they ought to celebrate the Pascha on the 25th of March when the resurrection befell.

The next mention of the 25th of December is in Hippolytus’ (c. 202) commentary on Daniel iv. 23. Jesus, he says, was born at Bethlehem on the 25th of December, a Wednesday, in the forty-second year of the birth of the Saviour. This passage also is almost certainly interpolated. In any case he mentions no feast, nor was such a feast congruous with the orthodox ideas of that age. As late as 245 Origen, in his eighth homily on Leviticus, repudiates as sinful the very idea of keeping the birthday of Christ “as if he were a king Pharaoh.” The first certain mention of Dec. 25 is in a Latin chronographer of A.D. 354, first published entire by Mommsen. It runs thus in English: “Year 1 after Christ, in the consulate of Caesar and Paulus, the Lord Jesus Christ was born on the 25th of December, a Friday and 15th day of the new moon.” Here again no festal celebration of the day is attested.

There were, however, many speculations in the 2nd century about the date of Christ’s birth. Clement of Alexandria, towards its close, mentions several such, and condemns them as superstitions. Some chronologists, he says, alleged the birth to have occurred in the twenty-eighth year of Augustus, on the 25th of Pachon, the Egyptian month, i.e. the 20th of May. These were probably the Basilidian gnostics. Others set it on the 24th or 25th of Pharnathi, i.e. the 19th or 20th of April. Clement himself sets it on the 17th of November, 3 a.c. The author of a Latin tract, called the *De Pascha computus*, written in Africa in 243, sets it by private revelation, *ab ipso deo inspitiati*, on the 28th of March. He argues that the world was created perfect, flowers in bloom, and trees in leaf, therefore in spring; also at the equinox, and when the moon just created was full. Now the moon and sun were created on a Wednesday. The 28th of March suits all these considerations. Christ, therefore, being the Sun of Righteousness, was born on the 28th of March. The same symbolical reasoning led Polycarp (before 160) to set his birth on Sunday, when the world’s creation began, but his baptism on Wednesday, for it was the analogue of the sun’s creation. On such grounds certain Latins as early as 354 may have transferred the human birthday from the 6th of January to the 25th of December, which was then a Mithraic feast and is by the chronographer above referred to, but in another part of his compilation, termed *Natalis invicti solis*, or birthday of the unconquered Sun. Cyprian (*de orat. dom. 35*) calls Christ *Sol versus*, Ambrose *Sol bonus noster* (*Sermo vii. 13*), and such rhetoric was widespread. The Syrians and Armenians, who clung to the 6th of January, accused the Romans of sun-worship and idolatry, contending with great probability that the feast of the 25th of December had been invented by disciples of Cerinthus and its lections by Artemon to commemorate the natural birth of Jesus. Chrysostom also testifies the 25th of December to have been from the beginning known in the West, from Thrac and even as far as Gades. Ambrose, *On Virginis*, iii. ch. 1, writing to his sister, implies that as late as the papacy of Liberius 352-356, the Birth from the Virgin was feasted together with the Marriage of Cana and the Banquet of the 4000 (*Luke ix. 13*), which were never feasted on any other day but Jan. 6.

Chrysostom, in a sermon preached at Antioch on Dec. 20, 386 or 388, says that some held the feast of Dec. 25 to have been held in the West, from Thrace as far as Cadiz, from the beginning. It certainly originated in the West, but spread quickly eastwards. In 553-561 it was observed at the court of Constantius. Basil of Caesarea (died 379) adopted it. Honorius, emperor (395-423) in the West, informed his mother and brother Arcadius (395-408) in Byzantium of how the new feast was kept in Rome, separate from the 6th of January, with its own *troparia* and *sticharia*. They adopted it, and recommended it to Chrysostom, who had long been in favour of it. Epiphanius of Crete was won over to it, as were also the three patriarchs, Theophilus of Alexandria, John of Jerusalem, Flavian of Antioch. This was under Pope Anastasius, 398-400. John or Wahan of Nice, in a letter printed by Combelinsinis'Historiamonashilizaram', affords the above details. The new feast was communicated by Proclus, patriarch of Constantinople (434-446), to Sahak, archbishop of Armenia, about 440. The letter was betrayed to the Persian king, who accused Sahak of Greek intrigues, and deposed him. However, the Armenians, at least those within the Byzantine pale, adopted it for about thirty years, but finally abandoned it together with the decrees of Chalcedon early in the 8th century. Many writers of the period 375-450, e.g. Epiphanius, Cassian, Asterius, Basil, Chrysostom and Jerome, contrast the new feast with that of the Baptistism as that of the birth *after the flesh*, from which we infer that the latter was generally regarded as a birth according to the Spirit. Instructive as showing that the new feast travelled from West eastwards is the fact (noticed by Usener) that in 387 the new feast was reckoned according to the Julian calendar by writers of the province of Asia, who in referring to other feasts use the reckoning of their local calendars. As early as 400 in Rome an imperial rescript includes Christmas among the three feasts (the others are Easter and Epiphany) on which theatres must be closed. Epiphany and Christmas were not made *judicial non dies* until 534.

4 In a fragment preserved by an Armenian writer, Aanašas of Shirak.
CHRISTMAS ISLAND

For some years in the West (as late as 353 in Rome) the birth feast was appended to the baptismal feast on the 6th of January, and in Jerusalem it altogether supplanted it from about 350 to 440, when Bishop Juvenal introduced the feast of the 2nd of December. The new feast was about the same time (440) finally established in Alexandria. The quadragesima of Epiphany (i.e., the feast of the presentation in the Temple, or kubahapost) continued to be celebrated in Jerusalem on the 14th of February, forty days after the 6th of January, until the reign of Justinian. In most other places it had long before been put back to the 2nd of February to suit the new Christmas. Armenian historians describe the riots, and display of armed force, without which Justinian was not able in Jerusalem to transfer this feast from the 14th to the 2nd of February.

The grounds on which the Church introduced so late as 350-440 a Christmas feast till then unknown, or, if known, precariously linked with the baptism, seem to the main to have been the following: (1) The transition from adult to infant baptism was proceeding rapidly in the East, and in the West was well-nigh completed. Its natural complement was a festal recognition of the fact that the divine element was present in Christ from the first. The assumption of human nature was not only an actual but a spiritual event, and the descent of the Spirit upon him at baptism. The general adoption of child baptism helped to extinguish the old view that the divine life in Jesus dated from his baptism, a view which led the Epiphany feast to be regarded as that of Jesus' spiritual rebirth. This aspect of the feast was therefore forgotten, and its importance in every way diminished by the new and rival feast of Christmas. (2) The 4th century witnessed a rapid diffusion of Marcionite, or, as it was now called, Manichean propaganda, the chief tenet of which was that Jesus either was not born at all, was a mere phantom, or anyhow did not take flesh of the Virgin Mary. Against this view the new Christmas was a protest, since it was peculiarly the feast of his birth in the flesh, or as a man, and is constantly spoken of as such by the fathers who witnessed its institution.

In Britain the 25th of December was a festival long before the conversion to Christianity, for Bede (De temp. rat. ch. 13) relates that "the ancient peoples of the Anglii celebrated the year's end on the 25th of December when we now celebrate the birthday of the Lord; and the very night which is now so holy to us, they called in their tongue modranoc (modra nih), that is, the mothers' night, by reason we suspect of the ceremonies which in that night-long vigil they performed." With his usual reticence about matters pagan or not orthodox, Bede abstains from recording who the mothers were and what the ceremonies were. In 644 the English puritans forbade any Merriment or religious services by act of Parliament, on the ground that it was a heathen festival, and ordered it to be kept as a fast. Charles II. revived the feast, but the Scots adhered to the Puritan view.

Outside Teutonic countries Christmas presents are unknown. Their place is taken in Latin countries by the strennes, French fourrées, given on the 1st of January; this was in antiquity a great holiday, wherefore until late in the 4th century the Christians kept it as a day of fasting and gloom. The setting up of a creche at Christmas crèche is said to have been originated by St. Francis.

CHRISTMAS ISLAND, a British possession under the government of the Straits Settlements, situated in the eastern part of the Indian Ocean (in 10° 25' S., 104° 42' E.), about 190 n. m. S. of Java. The island is a quadrilateral with hollowed sides, about 12 m. in greatest length and 9 in extreme breadth. It is probably the only tropical island that had never been inhabited by man before the European settlement. When the first settlers arrived, in 1828, it was covered with a dense forest of great trees and luxuriant under-shrubbery. The settlement in Flying Fish Cove now numbers some 250 inhabitants, consisting of Europeans, Sikhs, Malays and Chinese, by whom roads have been cut and patches of cleared ground cultivated.

The island is the flat summit of a submarine mountain more than 15,000 ft. high, the depth of the platform from which it rises being about 14,000 ft., and its height above the sea being upwards of 1000 ft. The submarine slopes are steep, and within 20 m. of the shore the depth of the sea reaches 2400 fathoms. It consists of a central plateau descending to the water in three terraces, each with its "tread" and "rise." The shore terrace descends by a steep cliff to the sea, forming the "rise" of a submarine "tread" in the form of fringing reef which surrounds the island and is never uncovered, even at low water, except in Flying Fish Cove, where the only landing-place exists. The central plateau is a plain whose surface presents "rounded, flat-topped hills and low ridges and reefs of limestone," with narrow intervening valleys. On its northern aspect this plateau has a raised rim having all the appearance of the edge of the margin of an atoll. On these rounded hills occurs the deposit of phosphate of lime which gives the island its commercial value. The phosphatic deposit has doubtless been produced by the long-continued action of a thick bed of sea-fowl dung, which converted the carbonate of the underlying limestone into phosphate. The flat summit is formed by a succession of limestones—all deposited in shallow water—from the Eocene (or Oligocene) up to recent deposits in the above-mentioned atoll with islands on its reef. The geological sequence of events appears to have been the following:—After the deposition of the Eocene (or Oligocene) limestone—which repose upon a floor of basalts and trachytes—basalts and basic tufts were ejected, over which, during a period of very slow depression, orbital limestones of Miocene age—which seem to make up the great mass of the island—were deposited; then elapsed a long period of rest, during which the atoll condition existed and the guano greatly increased; from then down to the present time there has succeeded a series of sea-level subsidences, resulting in the formation of the terraces and the accumulation of the detritus now seen on the first inland cliff, the old submarine slope of the island. The occurrence of such a series of Tertiary deposits appears to be unknown elsewhere. The whole series was evidently deposited in shallow water on the summit of a submarine volcano standing in its present isolation, and round which the ocean floor has probably altered but a few hundred feet since the Eocene age. Thus although the rocks of the southern coast of Java in their general character and succession resemble those of Christmas Island, there lies between them an abyssal trough 18,000 ft. in depth, which renders it scarcely possible that they were deposited in a continuous area, for such an enormous depression of the sea-floor could hardly have occurred since Miocene times without involving also Christmas Island. One of the main purposes of the exploration was to obtain light on the question of the formation of atolls.

The flora consists of 300 species of angiosperms, 1 Cycas, 22 ferns, and a few mosses, lichens and fungi, 17 of which are endemic, while a considerable number—not specifically distinct—form local varieties nearly all presenting Indo-Malayan affinities, as do the single Cycas, the ferns and the cryptogams. As to its fauna, the island contains 319 species of animals—54 only vertebrates—145 of which are endemic. A very remarkable distributional fact in regard to them, and one not yet fully explained, is that a large number show affinity with species in the Austro-Malayan rather than in the Indo-Malay, their nearer, region. The ocean currents, the trade-winds blowing from the Australian mainland, and north-westerly storms from the Malayalas islands, are no doubt responsible for the introduction of many, but not all, of these Malayalas and Australasian species. The climate is healthy, the temperature varying from 75° to 84° F. The prevailing wind is the S.E. trade, which
blows the greater part of the year. The rainfall in the wet season is heavy, but not excessive, and during the dry season the ground is refreshed with occasional showers and heavy dews. Malarial fever is not prevalent, and it is interesting to note that there are no swamps or standing waters on the island.

It is not known when and by whom the island was discovered, but under the name of Moni it appears on a Dutch chart of 1666. It was first visited in 1688 by Dampier, who found it uninhabited. In 1886 Captain Maclear of H.M.S. "Flying Fish," having discovered an anchorage in a bay which he named Flying Fish Cove, landed a party and made a small but interesting collection of the flora and fauna. In the following year Captain Aldrich on H.M.S. "Egeria" visited it, accompanied by Mr. J. J. Listér, F.R.S., who formed a larger biological and mineralogical collection. Among the rocks then obtained and submitted to Sir John Murray for examination there were detected specimens of nearly pure phosphate of lime, a discovery which eventually led, in June 1888, to the annexation of the island to the British crown. Soon afterwards a small settlement was established in Flying Fish Cove by Mr. G. Clunies Ross, the owner of the Keeling Islands, which lie about 750 m. to the westward. In 1891 Mr. Ross and Sir John Murray were granted a lease, but on the further discovery of phosphatic deposits they disposed of their rights in 1897 to a company. In the same year a thorough scientific exploration was made, at the cost of Sir John Murray, by Mr. C. W. Andrews, of the British Museum.

CHRISTODORUS, of Coptos in Egypt, epic poet, flourished during the reign of Anastasius I. (A.D. 497–518). According to Suidas, he was the author of Ἡράπα, accounts of the foundation of various cities; Αὐδαία, the mythical history of Lydia; Λειαπόδα, the conquest of Iberia by Anastasius; three books of epigrams; and many other works. In addition to two epigrams (Aith. rhet. v. 607, 698) we possess a collection of eighty stanzas of gods, heroes and famous men and women in the gymnasium of Zeuxippos at Constantinople. This ἔργασια, consisting of 417 hexameters, forms the second book of the Palantine Anthology. The writer’s chief models are Homer and Nonnus, whom he follows closely in the structure of his hexameters. Opinions are divided as to the merits of the work. Some critics regard it as of great importance for the history of art and a model of description; others consider it valueless, alike from the historical, mythological and archaeological points of view.

See F. Baumgarten, De Christodoro poeta Thébano (1861), and his article in Pauly-Wissowa, Realencyklopädie der klassischen Altertumskunde, iii. 2 (1899); W. Christ, Geschichte des deutschen Litteratur (1898).

CHRISTOPHER, SAINT (Christophoros, Christoforos), a saint honoured in the Roman Catholic (25th of July) and Orthodox Eastern (8th of May) Churches, the patron of ferrymen. Nothing that is authentic is known about him. He appears to have been originally a pagan and to have been born in Syria. He was baptized by Babylas, bishop of Antioch; preached with much success in Lycia; and was martyred about A.D. 290 during the persecution under the emperor Decius.¹ Round this small nucleus of possibility, however, a vast mass of legendary matter gradually collected. All accounts agree that he was of great stature and singularly handsome, and that this helped him not a little in his evangelistic work. But according to a story reproduced in the New Uniat Anthology of Arcadius, and mentioned in Basil’s Monologue, Christopher was originally a hideous man-eating ogre, with a dog’s face, and only received his human semblance, with his Christian name, at baptism. Most of his astounding miracles are of the ordinary type. He throws his staff into the ground; whereupon it sprouts into a date palm, and thousands are converted. Courtesans sent to seduce him are turned by his mere aspect into Christians and martyrs. The Roman governor is confounded by his insensibility to the most refined and ingenious tortures. He is roasted over a slow fire and basted with boiling oil, but tells his tormentors that by the grace of Jesus Christ he feels nothing. When at last, in despair, they cut off his head, he had converted 48,000 people.

The more conspicuous of these legends are included in the Mozarabic Brevisarius and Missal, and are given in the thirty-third sermon of Peter Damien, but the best-known story is that which is given in the Golden Legend of Jacobus de Voragine. According to this, Christopher—or rather Reprobus, as he was then called—was a giant of vast stature who was in search of a man stronger than himself, whom he might serve. He left the service of the king of Canaan because the king feared the devil, and that of the devil because the devil feared the Cross. He was converted by a hermit; but as he had neither the gift of fasting nor that of prayer, he decided to devote himself to a work of charity, and set himself to carry wayfarers over a bridgeless river. One day a little child asked to be taken across, and Christopher took him on his shoulder. When half way over the stream he staggered under what seemed to him a crushing weight, but he reached the other side and then upbraided the child for placing him in peril. "Had I borne the whole world on my back," he said, "it could not have weighed heavier than thou!" "Marvel not!" the child replied, "for thou hast borne upon thy back the world and him who created it!" It was this story that gave Christopher his immense popularity throughout Western Christendom.

See Bolland. Acta Sanct. vi. 146; Guenebault, Dict. iconographe des auteurs des figures et des legesdes saints (Paris, 1850); Smith and Wace, Dict. of Christ. Biog. (London, 1853, 3 vols.); A. Sinemus, Die Legende von h. Christophorus (Hanover, 1868); and other literature cited in Herzog-Hauck, Realencyk. iv. 60.

CHRISTOPHORUS, pope or anti-pope, elected in 903 against Leo V., whom he threw into prison. In January 904 he was treated in the same fashion by his competitor, Sergius III., who had established a papal college.

CHRISTOPoulos, ATHANASIOS (1772–1847), Greek poet, was born at Castoria in Macedonia. He studied at Buda and Padua, and became teacher of the children of the Vlač prince Mouroussi. After the fall of that prince in 1811, Christophoulos was employed by Prince Caradja, who had been appointed hospodar of Moldavia and Walachia, in drawing up a code of laws for that country. On the removal of Caradja, he retired into private life and devoted himself to literature. He wrote drinking songs and love ditties which are very popular among the Greeks. He is also the author of a tragedy, of Politika Parallela (a comparison of various systems of government), of translations of Homer and Herocitus, and of some philological works on the connexion between ancient and modern Greek.

His Hellénika Arkhaislogiámatos (Athens, 1853) contains an account of his life.

CHRIST’S HOSPITAL (the "Blue-coat School"), a famous English educational and charitable foundation. It was originally one of three royal hospitals in the city of London, founded by Edward VI., who is said to have been inspired by a sermon of Bishop Ridley on charity. Christ’s hospital was specially devoted to fatherless and motherless children. The buildings of the monastery of Grey Friars, Newgate Street, were appropriated to it; liberal public subscription added to the king’s grant endowed it richly; and the mayor, commonalty and citizens of London were nominated its governors in its charter of 1535. At first Christ’s hospital shared a common fund with the two other hospitals of the foundation (Bridewell and St Thomas’s), but the three soon became independent. Not long after its opening Christ’s was providing home and education (or, in the case of the very young, nursing) for 400 children. The popular name of the Blue-coat school is derived from the dress of the boys—originally (almost from the time of the foundation) a blue gown, with knee-breeches, yellow petticoat and stockings, seabands and a blue cap. The petticoat and cap were given up in the middle of the 19th century, and thereafter no head-covering was worn. The buildings on the Newgate Street site underwent reconstruction from time to time, and in 1902 were vacated by

¹ Or Dagnus—perhaps to be identified with Maximinus Daza, joint emperor (with Galerius) in the East 305–311, and sole emperor 311–313.
CHRISTY—CHRANOM

the school, which was moved to extensive new buildings at Horsham. The London buildings were subsequently taken down. The school at Horsham is conducted on the ordinary lines of a public school, and can accommodate over 800 boys. It includes a preparatory school for boys, established in 1683 at Hertford, where the buildings have been greatly enlarged for the use of the girls' school on the same foundation. This was originally in Newgate Street, but was moved to Hertford in 1778. In the boys' school the two highest classes retain their ancient names of Grecians and Deputy Grecians. Children were formerly admitted to the schools only on presentation. Admission is now (1) by presentation of donation governors (i.e. the royal family, and contributors of £500 or more to the funds), of the council of almoners (which administers the endowments), or of certain of the city companies; (2) by competition, on the nomination of a donation governor (for boys only), or from public elementary schools in London, certain city parishes and certain endowed schools elsewhere. The main school is divided into two parts—the Latin school, corresponding to the classical side in other schools, and the mathematical school or modern side. Large pension charities are administered by the governing body, and an annual income of the hospital (about £50,000 annually) is devoted to apprenticing boys and girls, to leaving exhibitions from the school, &c.

CHRISTY, HENRY (1810-1865), English ethnologist, was born at Kingston-on-Thames on the 26th of July 1810. He entered his father's firm of hatters, in London, and later became a director of the London Joint-Stock Bank. In 1850 he started on a series of journeys, which interested him in ethnological studies. Encouraged by what he saw at the Great Exhibition of 1851, Christy devoted the rest of his life to perpetual travel and research, making extensive collections illustrating the early history of man, now in the British Museum. He travelled in Norway, Sweden, Denmark, Mexico, British Columbia and other countries; but in 1858 came the opportunity which brought him fame. It was in that year that the discoveries by Boucher de Perthes of flint-implements in France and England were first held to have clearly proved the great antiquity of man. Christy joined the Geological Society, and in company with his friend Edouard Lartet explored the caves in the valley of the Vézère, a tributary of the Dordogne in the south of France. To his task Christy devoted money and time ungrudgingly, and an account of the explorations appeared in Comptes rendus (Feb. 29th, 1864) and Transactions of the Ethnological Society of London (June 21st, 1864). He died, however, on the 4th of May 1865, of inflammation of the lungs supervening on a severe cold contracted during excavation work at La Puisaye, leaving a half-finished book, entitled Reliques Aquitaines, being contributions to the Archaeology and Palaeontology of Perigord and the adjacent provinces of Southern France; this was issued in parts and completed at the expense of Christy's executors, first by Lartet and, after his death in 1870, by Professor Rupert Jones. By his will Christy bequeathed his magnificent ethnological collection to the nation. In 1883 it found a home in the British Museum. Christy took an earnest part in many philanthropic movements of his time, especially identifying himself with the efforts to relieve the sufferers from the Irish famine of 1847.

CHRANOMIC (Gr. χρωματικός, coloured, from χρώμα, colour), a term meaning "coloured," chiefly used in science, particularly in the expression "chromatic aberration" or "dispersion" (see ABERRATION). In Greek music χρωματική μονότης was one of three divisions—diatonic, chromatic and enharmonic—of the tetrachord. Like the Latin color, χρώμα was often used of ornaments and embellishments, and particularly of the modification of the three genera of the tetrachord. The chromatic, being subject to three such modifications, was regarded as particularly "coloured." To the Greeks chromatic music was sweet and plaintive. From a supposed resemblance to the notes of the chromatic tetrachord, the term is applied to a succession of notes outside the diatonic scale, and marked by accidentals. A chromatic scale is thus a series of semi-tones, and is commonly written with sharps in ascending and flats descending. The most correct method is to write such accidentals as do not involve a change of key.

CHRANITE, a member of the spinel group of minerals; an oxide of chromium and ferrous iron, FeCrO₃. It is also known as chromic iron or as chrome-iron-ore, and is the chief commercial source of chromium and its compounds. It crystalizes in regular octahedra, but is usually found as grains or as granular to compact masses. In its iron-black colour with submetallic lustre and absence of cleavage it resembles magnetite (magnetic iron-ore) in appearance, but differs from this in being only slightly if at all magnetic and in the brown colour of its powder. The hardness is 5½; specific gravity 4.5. The theoretical formula FeCrO₃ corresponds with chromium oxide (Cr₂O₃) 68% and ferrous oxide 32%; the ferrous oxide is, however, usually partly replaced by magnesia, and the chromic oxide by alumina and ferric oxide, so that there may be a gradual passage to picotic or chromespinel. Much of the material mined as ore does not contain more than 40 to 50% of chromic oxide. In the form of isolated grains the mineral is a characteristic constituent of ultrabasic igneous rocks, namely the peridotites and the serpentines which have resulted from their alteration. It is also found under similar conditions in meteoric stones and irons. Often these rocks include large segregated masses of granular chromite. The earliest worked deposits were those in the serpentine of the Bare Hills near Baltimore, Maryland, U.S.A.; it was also formerly extensively mined in Lancaster county, Pennsylvania, and is now mined in California, as well as in Turkey, the Urals, Dun Mountain near Nelson in New Zealand, and Unst in the Shetlands.

Chromite-iron ore is largely used in the preparation of chromium compounds for use as pigments (chrome-yellow, &c.) and in calico-printing; it is also used in the manufacture of chrome-steel.

CHROMIUM (symbol Cr, atomic weight 52.1), one of the metallic chemical elements, the name being derived from the fine colour (Gr. χρώμα) of its compounds. It is a member of the sixth group in the periodic classification of the elements, being included in the natural family of elements containing molybdenum, tungsten and uranium. The element is not found in the free state in nature, nor to any large extent in combination, occurring chiefly as chrome-ironstone, Cr₂O₃·FeO, and occasionally being found as crocoite, PbCrO₄, chrome-ochre, CrO₃, and chromegarnet, CaO·Cr₂O₃·3SiO₂, while it is also the cause of the colour in serpentine, chrome-mica and the emerald. It was first investigated in 1789 by L. N. Bau quar and Macquart, and in 1797 by Vauquelin, who found that the lead in crocoite was in combination with an acid, which he recognized as the oxide of a new metal.

The metal can be obtained by various processes. Thus Sainte Claire Deville prepared it as a very hard substance of steel-grey colour, capable of taking a high polish, by strong ignition of chromic oxide and sugar charcoal in a lime crucible. F. Wöhler reduced the sesquioxide by zinc, and obtained a shining green powder of specific gravity 6.81, which tarnished in air and dissolved in hydrochloric acid and warm dilute sulphuric acid, but was unacted upon by concentrated nitric acid. H. Moissan (Comptes rendus, 1893, 116, p. 369; 1894, 119, p. 185) reduces the sesquioxide with carbon, in an electric furnace; the product so obtained (which contains carbon) is then strongly heated with lime, whereupon most of the carbon is removed as calcium carbide, and the remainder by heating the purified product in a crucible lined with the double oxide of calcium and chromium. An easier process is that of H. Goldschmidt (Annalen, 1898, 301, p. 19) in which the oxide is reduced by metallic aluminium; and if care is taken to have excess of the sesquioxide of chromium present, the metal is obtained quite free from aluminium. The metal as obtained in this process is lustrous and takes a polish, does not melt in the oxyhydrogen flame, but liquifies in the electric arc, and is not affected by air at ordinary temperatures. Chromium as prepared by the Goldschmidt process is in a passive condition as regards dilute sulphuric acid and dilute hydrochloric acid at ordinary temperatures; but by heating the metal with the acid it passes into the active condition, the same effect being produced by heating the inactive form with a solution of an alkaline halide.
W. Hittorf thinks that two allotropic forms of chromium exist (Zeit. f. Phys. Chem., 1898, 25, p. 759; 1899, 39, p. 481; 1900, 34, p. 385), namely active and inactive chromium; but W. Ostwald (ibid., 1900, 6, p. 35, 204) has observed that on dissolving chromium in dilute acids, the rate of solution as measured by the evolution of gas is not continuous but periodic. It is largely made as ferro-chrome, an alloy containing about 60-70% of chromium, by reducing chrome in the electric furnace or by aluminium.

Chromium and its salts may be detected by the fact that they give a deep green bead when heated with boric acid, or that on fusion with sodium carbonate and nitre, a yellow mass of an alkaline chromate is obtained, which, on solution in water and acidification with acetic acid, gives a bright yellow precipitate on the addition of soluble lead salts. Sodium and potassium hydroxide solutions precipitate green chromium hydroxide from solutions of chromic salts; the precipitate is soluble in excess of the cold alkali, but is completely thrown down on boiling the solution. Chromic acid and its salts, the chromates and bichromates, may be detected by the violet colour which they give on addition of hydrogen peroxide to their dilute acid solution, or by the fact that on distillation with concentrated sulphuric acid and an alkaline chloride, the red vapours of chromium oxychloride are produced. The yellow-coloured, fuming chlorinated acid is produced in the case of acid, but goes back again to yellow on making the solution alkaline. Normal chromates on the addition of silver nitrate give a red precipitate of silver chromates, easily soluble in ammonia, and with barium chloride a yellow precipitate of barium chromate, insoluble in acetic acid. Reducing agents, such as sulphurous acid and sulphuric hydrogen, convert the chromates into chromic salts. Chromium in the form of its salts may be estimated quantitatively by precipitation from boiling solutions with a slight excess of ammonia, and boiling until the free ammonia is nearly all expelled. The precipitate obtained is filtered, well washed with hot water, dried and then ignited until the weight is constant. In the form of a chromate, it may be determined by precipitation, in acetic acid solution, with lead acetate; the lead chromate precipitate collected on a tared filter paper, well washed, dried at 100° C. and weighed; or the chromate may be reduced by means of sulphur dioxide to the condition of a chromic salt, the excess of sulphur dioxide expelled by boiling, and the estimation carried out as above.

The atomic weight of chromium has been determined by S. Grahé, by the conversion of potassium dichromate into the tetroxide (J. of Chem. Soc., 1891, 31, p. 863), the mean value obtained being 52.05; and also by C. Meinecke, who estimated the amount of silver, chromium and oxygen in silver chromate, the amount of oxygen in potassium bichromate, and the amount of oxygen and chromium in ammonium bichromate (Ann., 1891, 261, p. 339), the mean value obtained being 51.99.

Chromium forms three series of compounds, namely the chromic salts corresponding to CrO, crO₃, cr₂o₇, and Cr₂O₃, chromium oxide, chromium oxide, and chromium oxide, corresponding to Cr₂O₃, CrO₃, and CrO₇. The chromes corresponding to Cr₂O₃, CrO₃, and CrO₇, are chromium trioxide or chromic acid. Chromium trioxide is a basic oxide, which acts as an acid-forming oxide towards strong bases, forming salts called chromates. Various other oxides of chromium, intermediate in composition between the sesquioxide and trioxide, have been described, namely chromium bichromate, Cr₂O₃Cr₂O₇, and the oxide CrO₂Cr₂O₃.

Chromium oxide, Cr₂O₃, is unknown in the free state, but in the hydrated condition as Cr₂O₃H₂O or Cr₂O₃(OH)₂, it may be prepared by precipitating chromium chloride by a solution of potassium hydroxide, and has been deposited as an amorphous solid which readily oxidizes on exposure, and is decomposed by heat with liberation of hydrogen and formation of the sesquioxide. The sesquioxide, CrO₃, occurs native, and can be artificially prepared by heating the sesquioxide in a current of sterile air, or by passing the vapours of chromium oxychloride through a red hot tube, or by ignition of mercuric chromate. In the amorphous state it is a dull green, almost insubstantial powder, but as obtained from chromium oxychloride it is deposited in the form of dark green hexagonal crystals of specific gravity 5.2. After ignition it becomes almost insoluble in acids, and on fusion with salicylic it colours them green; consequently it is used as a pigment for colouring glass and china. By the fusion of potassium bichromate with boric acid, and extraction of the melt with water, a residue is left which possesses a fine green colour, and is used as a pigment under the name of Guignet's green. In composition it approximates to Cr₂O₃H₂O, and contains more or less boron trioxide. Several forms of hydrated chromium sesquioxide are known; those on precipitation of a chromic salt, free from alkali, by ammonia, a light blue precipitate is formed, which after drying over sulphuric acid, has the composition Cr₂O₃H₂O, and this after being heated to 200° C. in a current of dry air, gives the green Cr₂O₃H₂O. Other hydrated oxides such as Cr₂O₃H₂O have also been described. Chromium trioxide, CrO₃, is obtained by adding concentrated sulphuric acid to a cold solution of chromium sesquioxide. The precipitate on heating in long red needles; the mother liquor is drained off and the crystals are washed with concentrated nitric acid, the excess of which is removed by means of a current of dry air. It is readily soluble in water, and in acetic acid. It is precipitated at a higher temperature into chromium sesquisulphide and oxygen; it is a very powerful oxidizing agent, acting violently on alcohol, converting it into acetone, and in glacial acetic acid solution converting ethylene and anhydride into the corresponding quinones. Heated with concentrated hydrochloric acid it liberates chlorine, an with sulphuric acid it liberates oxygen. Gaseous ammonia passed over the oxide reduces it to the sesquioxide with formation of nitrogen and water. Dissolved in hydrochloric acid at -20° C., it yields with solutions of the alkalies chromic cyanide, crystallizing in short red needles. It is an pentaveal pentachromate. For salts of this acid-forming oxide and for perchromic acid see Bichromates.

The chromes may be looked upon as salts of chromium sesquioxide with hydroxyl or oxide radicals.

Chromium oxide, Cr₂O₃, is prepared by reducing chromic chloride in hydrogen; it forms white siliki needles, which dissolve in water giving a deep blue solution, which rapidly absorbs oxygen, forming basic chromic salts or by reducing the agent. The bromide and iodide are formed in a similar manner by heating the metal in gaseous hydrobromic or hydroiodic acids.

Chromium sulfate, Cr₂O₃O₇, isomorphous with ferrous sulphate, results from dissolving the metal in dilute sulphuric acid or, better, by dissolving crystalline chromic acid, when it separates in blue crystals on cooling the solution. On pouring a solution of chromic chloride into a saturated solution of sodium acetate, a red crystalline precipitate of chromous acetate is produced; this may be more conveniently prepared by dissolving some chromous salts and consequently can be used for their preparation.

Chromic salts are of a blue or violet colour, and apparently the chloride and bromide exist in a green and violet form.

Chromium chloride is prepared commercially by fuming a basic oxide by a mixture of the sesquioxide and carbon in a current of dry chlorine; it forms violet laminae almost insoluble in water, but dissolves rapidly in the presence of a trace of chromic chloride; this action is more conveniently carried out by adding the insoluble chromic chloride to the chromic chloride and the original chromic chloride converted into soluble chromic chloride, the newly formed chromic chloride being capable of reducing the other chromic chloride. Solutions of chromic chloride in presence of excess of acid are green in colour. According to A. Werner, four hydrated chromic chlorides exist, namely the green and violet salts, Cr₂O₃H₂O, and Cr₂O₃H₂O, and one chloride ion, since these are converted into the chloride by adding an excess of silver nitrate solution at 0° C. Two of the six water molecules are easily removed in a desiccator, and the salt formed, Cr₂O₃H₂O, resembles the original salt in properties, only one-third of the chloride being present. The chloride is represented by the formula Cr₂O₃H₂O, in accordance with his theory of the constitution of salts Werner formulates the hexahydrate as Cr₂O₃(OH)₂·5H₂O.

Chromic brome, CrBr₃, is prepared in the anhydrous form by the same methods that are used for the chloride, and resembles it in its properties. The iodide is unknown.

The fluoride, CrF₃, results on passing hydrofluoric acid over the heated chloro-acid, and sublimes in needles. The hydrated fluoride, Cr₂OF₃H₂O, obtained by adding ammonium fluoride to cold chromic chloride, is sparingly soluble in water, and is decomposed by heat.

Oxyhalogens derivatives of chromium are known, the oxychlorides, CrCl₃, resulting on heating potassium bichromate and common salt, and the oxybromides of CrBr₃, are obtained by distilling a dark red liquid of bolling point 117° C., and is to be regarded as the acid chloride corresponding to chromium acid, Cr₂O₃H₂O. It dissolves iodine and absorbs chlorine, and is decomposed by water with formation of chromic and hydrochloric acid, with sulphur, ammonia, alcohol, and, and explodes in contact with phosphorus; it also acts as a powerful oxidizing agent. Heated in a closed tube at 180° C. it loses chlorine and leaves a black residue of trichromyl chloride, Cr₂O₃Cl, which deliquesces on exposure to air.

CHROMIUM 297
Analogous bromine and iodine compounds are unknown, since bromides and iodides on heating with potassium dichromate and concentrated sulphuric acid give free bromine or free iodine.

The oxychloride, CrOBr₂, is obtained in a similar manner to the oxychloride by using fluor spar in place of common salt. It may be converted to a yellowish liquid which is decomposed by moist air into chromic acid and chromic fluoride.

The semi-chromic chloride, CrO₂Cl₂·OH, chlorochromic acid, is only known in the form of its salts, the chromochromates.

Potassic chromate is obtained when potassium dichromate is heated with concentrated hydrochloric acid and a little water, or from chromic oxychloride and saturated potassium chloride solution, when it separates as a red crystalline salt. By suspension of the potassium dichromate and potassium hydroxide, it is obtained as a white, powdery salt. Concentrated potassium hydroxide is used for preparing this salt, and also by nitric acid, with liberation of nitrogen which is decomposed by moist air into chromic acid and chromic fluoride.

The chromic acid, K₂Cr₂O₇, is obtained by fusing chromic anhydride with potassium carbonate in the presence of a little water, which is then distilled off, along with alcohol. It is soluble in cold water, giving a violet solution, which turns green on boiling. If the violet solution is allowed to evaporate slowly at ordinary temperatures the sulphate crystallizes out as Cr₂(OH)₃·H₂SO₄, but the green salt of chromic acid remains on evaporation, being only an amorphous mass.

Investigation has shown that the change is due to the splitting off of sulphuric acid during the process, and that green-coloured chromium-sulphuric acids are formed, i.e.:

$$2Cr_2O_7^{2-} + H_2O = H_2SO_4 + CrO_4^{2-} + SO_4^{2-}$$

Since, on adding barium chloride to the green solution, only one-third of the total sulphuric acid is precipitated as barium sulphate, whereas it follows that only one-third of the original SO₄ ions is present in the solution, the green salt of chromium is an hydrosulphate, on standing, gradually passes back to the violet form. Several other complex chrom-sulphuric acids are known, e.g.:

$$[Cr_2(SO_4)_{3}]_{12}H_2$$

(see A. Recourea, Annales de Chimie et de Physique, 1853 (7), p. 505.)

Chromate combines with the sulphates of the alkali metals to form the di-chromate sulphates, which contain a mixture of the alkali metal, K₂Cr₂O₇·3H₂O, is best prepared by passing sulphur dioxide through a solution of potassium dichromate containing the calculated quantity of sulphuric acid.

$$K_2CrO_7 + 3SO_2 + 3H_2O = H_2SO_4 + K_2SO_4 + CrO_3 + 3H_2O$$

On evaporating the solution, discolour parts of the alums are obtained. It is easily soluble in warm water, the solution being of a dull blue tinta, and is used in calico-printing, dyeing and tanning. Chromium ammonium sulphate, (NH₄)₂Cr₂O₇·3H₂O, is used in the dyeing of cotton and wool. It forms red or orange solutions, and is less soluble in water than the corresponding potassium compound. The salt K₂Cr₂O₇·H₂O has been described. By adding ammonia to heated chromic chloride, the yellow methylamine salt of chromium is formed. This is a valuable compound, and is used for making concentrated sulphuric acid it is transformed into chromium ammonium sulphate.

The nitrate, Cr(NO₃)₃·9H₂O, crystallizes in purple prisms and results on dissolving the dry salt in sulphuric acid, its solution turns green on boiling. A phosphide, P₃Cr₃, is known; it burns in oxygen forming the phosphates. By adding sodium phosphate to an excess of chrome alum the violet phosphate, Cr₂PO₄·3H₂O, is precipitated; on heating to a red heat, and then treating with water, a green precipitate, perhaps Cr₂PO₄·3H₂O, is obtained on adding an excess of sodium phosphate to chromic chloride solution.

Carbides of chromium are known; when the metal is heated in an electric furnace with excess of carbon, the reaction, C + Cr, takes place, and the crystals are very resistant to the action of acids; Cr₂C has also been described (H. Moissan, Comptes rendus, 1894, 119, p. 185).

Cyano compounds of chromium, analogous to those of iron and manganese, Cr₂CN·2H₂O, is formed from potassium cyanide and chromic acid; on exposure to air it is converted into the chromycyanide, K₂Cr₂(CN)₆, which can also be prepared by adding chromic acid solution to an alkaline solution of potassium cyanide. Cr₂(CN)₆₃, an amorphous deliquescent mass, is formed by dissolving the hydroxide in hydrochloric acid and drying over sulphuric acid. The double thiocyanate, Cr₂(SCN)₆·9H₂O, is also known. Chromium salts readily react with ammonia to form complexes in which the ammonia molecule is in direct combination with the metal, and further, that the ammonia molecule may be replaced by other such molecular groups as SCN⁻, etc. Of the types studied the following may be mentioned: the dichromate ammonio-thiocyanates, M₂[Cr(H₂N)₂(SCN)₃]Cl, the chloroquatammin chromium salts, R₂[Cr(NH₃)₅Cl]₂, the thiocyanatomanganese or roedeholm salts, R₃[Cr(NH₃)₅H₂O]Cl, the chloropentammin or purpuro-chromium salts, R₄[Cr(NH₃)₅OH]Cl, the nitrito pentammin or xanthochromium salts, R₅[NO₂(NH₃)₄Cr], the luteo or hexamine chromium salts, R₆[Cr(NH₃)₄CrOH]Cl, and the rhodochromium salts, R₇[Cr(NH₃)₃OH]Cl, which require further study.

P. Pfeiffer (Berichte, 1904, 37, p. 4255) has shown that chromium salts of the type [Cr(CH₃OH)₂][Cl₅] exist in two stereo-isomeric forms, namely, the cis- and trans- forms, the dichloro- and dihydroxy- and dichromium salts being the trans-salts. Their configuration was determined by their relationship to their oxalo-derivatives; the cis-dichloro-chromium, Cr₄H₂(C₂H₄)[CrH₂O₄], compound with potassium oxalate gave a carmine red crystalline complex salt, Cr₄H₂(C₂H₄)[CrH₂O₄]·K₂O, which is soluble in water and also in concentrated sulphuric acid, while from the trans-chloride a red complex salt is obtained containing the unaltered trans-dichloro group [Cr₂(CH₃OH)₃]Cl₂.

CHROMOSPHERE (from Gr. χρωμα, colour, and σφων, a sphere), in astronomy, the red-coloured envelope of the sun, outside of the photosphere. It can be seen with the eye at the beginning or ending of a total eclipse of the sun, and with a suitable spectroscope at any time under favourable conditions. (See Sun and Eclipse.)

CHRONICLE (from Gr. χρονις, time). The historical works written in the middle ages are variously designated by the terms "histories," "annals," or "chronicles"; it is difficult, however, to give an exact definition of each of these terms, since they do not correspond to definite classes of writings. The definitions proposed by A. Giry (in La Grande Encyclopédie), by Ch. V. Langlois (in the Manuel de bibliographie historique), and by E. Bernheim (in the Lehrbuch der historischen Methode), are manifestly insufficient. Perhaps the most reasonable is that propounded by H. F. Delaborde at the École des Chartes, that chronicles are accounts of a universal character, while annals relate either to a locality, or to a religious community, even to a single people. The attempt to treat of all periods or all peoples. The primitive type, he says, was furnished by Eusebius of Caesarea, who wrote (c. 303) a chronicle in Greek, which was soon translated into Latin and frequently recopied throughout the middle ages; in the form of synoptic and systematic tables it embraced the history of the world, both Jewish and Christian, since the Creation. This ingenious opinion, however, is only partially exact, for it is certain that the medieval authors or scribes were not conscious of any well-marked distinction between annals and chronicles; indeed, they often apparently employed the terms indiscriminately.

Whether or not a distinction can be made, chronicles and annals (q.v.) have points of great similarity. Chronicles are accounts generally of an impersonal character, and often anonymous, composed in varying proportions of passages reproduced textually from sources which the chronicle is seldom at pains to indicate, and of personal recollections the veracity of which can be at most imperfectly determined. Some of them are written with so little intelligence that the whole work of composition as a piece of drudgery imposed on the clergy and monks by their superiors. To distinguish what is original from what is borrowed, to separate fact from falsehood, and to establish the value of each piece of evidence, are in such circumstances a difficult undertaking, and one which has exercised the sagacity of scholars, especially since the 17th century. The work, moreover, is immense, by reason of the enormous number of medieval chronicles, both Christian and Mahomedan.

The Christian chronicles were first written in the two learned languages, Greek and Latin. At an early stage we have proof of the employment of national languages, the most famous instances being found at the two extremities of Europe, the Anglo-Saxon Chronicle (q.v.), the most ancient form of which goes back to the 10th century, and the so-called Chronicle of Nestor, in Palæo-Slavonic, written in the 11th and 12th centuries.
In the 13th and 14th centuries the number of chronicles written in the vulgar tongue continued to increase, at least in continental Europe, which far outpaced England in this respect. From the 15th century, with the revived study of Greek and Roman literature, the traditional form of chronicles, as well as of annals, tended to disappear and to be replaced by another and more scientific form, based on the models of antiquity—that of the historical composition combining skillful arrangement with elegance of literary style. The transition, however, was very gradual, and it was not until the 17th century that the traditional form became practically extinct.

See E. Bernheim, "Livre de continuité et de transition de l'histoire dans l'occident latin à la fin de l'âge médiéval" (Munich, 1903); H. Bloch, "Gesichte der deutschen Geschichtsschreibung im Mittelalter" (Munich, 1936); and F. Meisner, "Die Geschichtsschreibung in der deutschen Geschichte bis 1500" (Leipzig, 1906); and the Introduction (1904) to A. Moliner's "Les Sources de l'histoire de France.

CHRONICLES, BOOKS OF, two Old Testament books of the Bible. The name is derived from Chronicus, first suggested by Jerome as a rendering of the title which they bear in the Hebrew Canon, viz. Events of the Times. The full Hebrew title would be Book of Events of the Times, and this again appears to have been a designation commonly applied to special histories in the more definite shape—Events of the Times of King David, or the like (1 Chron. xxvii. 24; Esth. x, 2, &c.). The Greek translators divided the long book into two, and adopted the title Παράλεπομένα, Things omitted [sic. in the other historical books].

The book of Chronicles begins with Adam and ends abruptly in the middle of Cyrus's decree of restoration, which reappears complete at the beginning of Ezra. A closer examination of those parts of Ezra and Nehemiah which are not extracted from earlier documents or original memoirs leads to the conclusion that Chronicles-Ezra-Nehemiah was originally one work, displaying throughout the peculiarities of language and thought of a single editor, who, however, cannot be Ezra himself as tradition would have it. Thus the fragmentary close of a 2 Chronicles marks the disruption of a previously-existing continuity, —due, presumably, to the fact that in the gradual compilation of the Canon the necessity for incorporating in the Holy Writings an account of the establishment of the post-Exilic theocracy was felt, before it was thought desirable to supplement Samuel and Kings by adding a second history of the period before the Exile. Hence Chronicles is the last book of the Hebrew Bible, following the book of Ezra-Nehemiah, which properly is nothing else than the sequel of Chronicles.

Of the authorship of Chronicles we know only what can be determined by internal evidence. The style of the language, and also the independence in the book from that of the book in the Jewish Canon, stamp the book as one of the latest in the Old Testament, but fail to lead to an exact determination of the date.¹ In 1 Chron. xxxix. 7, which refers to the time of David, a sum of money is reckoned by darics, which certainly implies that the author wrote after this Persian coin had been long current in Judaea. In 1 Chron. iii. 10 sqq., the descendants of Zerubbabel seem to be reckoned to six generations (the Septuagint reads it so as to give as many as eleven generations), and this agrees with the suggestion that Hattush (verse 22), who belongs to the fourth generation from Zerubbabel, was a contemporary of Ezra (Ezra viii. 2). Thus the compiler lived at least two generations after Ezra. With this it accords that in Nehemiah five generations of high priests are enumerated from Joshua (xiii. 10 seq.), and that the last name is that of Jaddua, who, according to Josephus, was a contemporary of Alexander the Great (333 B.C.). That the compiler wrote after the fall of the Persian monarchy has been argued by Ewald and others from the use of the title king of Persia (2 Chron. xxxvi. 22), and from the reference made in Neh. xi. 22 to Darius III. (336-332 B.C.). A date some time after 332 B.C. is now accepted by most modern critics.

What seems to be certain and important for a right estimate of the book is that the writer lived a considerable time after Ezra, and stood entirely under the influence of the religious institutions of the new theocracy. This standpoint determined the nature of his interest in the early history of his people. The true importance of Hebrew history had always centered in the fact that this petty nation was the people of Yahweh, the spiritual God. The tragic interest which distinguishes the annals of Israel from the forgotten history of Moab or Damascus lies wholly in that long contest which finally vindicated the reality of spiritual things and the supremacy of Yahweh's purpose, in the political ruin of the nation which was the faithless depository of these sacred truths. After the return from the Exile it was impossible to write the history of Israel's fortunes otherwise than in a spirit of religious pragmatism. But within the limits of the religious conception of the plan and purpose of the Hebrew history more than one point of view might be taken up. The book of Kings looks upon the history in the spirit of the prophets—in that spirit which is still echoed by Zech. i. 5 seq., but which had become extinct before the Chronicler wrote. The New Jerusalem of Ezra was organized as a municipality and a church, not as a nation. The centre of religious life was no longer the living prophetic word but the ordinances of the Pentateuch and the liturgical service of the sanctuary. The religious vocation of Israel was no longer national but ecclesiastical or municipal, and the historical continuity of the nation was vividly realized only within the walls of Jerusalem and the courts of the Temple, in the solemn assembly and state ceremony of a feast day. These influences naturally operated most strongly on those who were officially attached to the sanctuary. To a Levite, even more than to other Jews, the history of Israel meant above all things the history of Jerusalem, of the Temple, and of the Temple ordinances. Now the writer of Chronicles betrays on every page his essentially Levitical habit of mind. It even seems possible from a close attention to his descriptions of sacred ordinances to conclude that his special interests are those of a common Levite rather than of a priest, and that of all Levitical functions he is most partial to those of the singers, a member of whose guild he may have been. From the standpoint of the post-exilic age, the older delineation of the history of Israel, especially in the books of Samuel and Kings, could not but appear to be deficient in some directions, while in other respects its narrative seemed superfluous or open to misunderstanding, as for example by recording, and that without condemnation, things inconsistent with the later post-Pentateuch law. The history of the ordinances of worship holds a very small place in the older record. Jerusalem and the Temple have not that central place in the book of Kings which they occupied in the minds of the Jewish community after the Exile. Large sections of the old story are devoted to the religion and politics of the ten tribes, which are altogether unintelligible and uninteresting when measured by a strictly Levitical standard; and in general the whole problems and struggles of the prophetic period turn on points which had ceased to be cardinal in the life of the New Jerusalem, which was no longer called to decide between the claims of the Word of Yahweh and the exigencies of political affairs and social customs, and which could not comprehend that men absorbed in deeper spiritual contests had no leisure for the niceties of Levitical legislation. Thus there seemed to be room for a new history, which should confine itself to matters still interesting to the theocracy of Zion, keeping Jerusalem and the Temple in the foreground, and developing the divine pragmatism of the history, not so much with reference to the prophetic word as to the fixed legislation of the Pentateuch, so that the whole narrative might be made to teach that the glory of Israel lies in the observance of the divine law and ritual.

For the sake of systematic completeness the book begins with Adam, as is the custom with later Oriental writers. But there was nothing to add to the Pentateuch, and the period from Moses to David contained little that served the purpose. The early history is therefore contracted into a series of tribal and priestly genealogies, which were doubtless by no means the least interesting part of the work at a time when every ¹See the lists in Driver, "L. of Old Test. pp. 502 seq.; and the exhaustive summary by Fr. Brown in Hastings" Hist. Dict. Bible, i. 289 seq.
Israeliite was concerned to prove the purity of his Hebrew descent (cp. Ezra ii. 59, 62). Commencing abruptly (after some Benjamite genealogies) with the death of Saul, the history becomes fuller and runs parallel with the books of Samuel and Kings. The limitations of the compiler's interest in past times appear in the omission, among other particulars, of David's reign in Hebron, of the disorders in his family and the revolt of Absalom, of the circumstances of Solomon's accession, and of many details as to the wisdom and splendour of that sovereign, as well as of his fall into idolatry. In the later history the ten tribes are quite neglected ("Yahweh is not with Israel," 2 Chron. xxv. 7), and political affairs in Judah receive attention, not in proportion to their intrinsic importance, but according as they serve to exemplify God's help to the obedient and His chastisement of the rebellious. That the compiler is always unwilling to speak of the misfortunes of good rulers is not necessarily to be ascribed to a deliberate suppression of truth, but shows that the book was throughout composed not in purely historical interests, but with a view to inculcating a single practical lesson. The more important additions to the earlier narrative consist partly of statistical lists (1 Chron. xiii.), partly of full details on points connected with the history of the sanctuary and the great as well as the lesser matters of the Levitical law (2 Chron. xxiv., xxvi., xxii.-xxix.; 2 Chron. xxxix.-xxx., &c.), and partly of narratives of victories and defeats, of sins and punishments, of obedience and its reward, which could be made to point a plain religious lesson in favour of faithful observance of the law (2 Chron. xiii., xiv. 9 sqq.; xx., xxx. ii. sqq. &c.). The minor variations of Chronicles from the books of Samuel and Kings are analogous in principle to the larger additions and omissions, so that the whole work has a consistent and well-marked character, presenting the history in quite a different perspective from that of the old narrative.

The compiler makes frequent reference to earlier histories which he cites by a great variety of names. That the names of the "Book of the Kings of Israel and Judah," "Book of the Kings of Judah and Israel," "Book of the Kings of Israel," and "Affairs of the Kings of Israel" (2 Chron. xxxii. 18), refer to a single work is not disputed. Under one or other title this book is cited some ten times. Whether it is identical with the Midrash of the book of Kings (2 Chron. xxiv. 27) is not certain. But it is evident that the book of the same name is manifest from what is said of its contents. It must have been quite an extensive work, for among other things it contained genealogical statistics (1 Chron. ix. 1), and it incorporated certain older prophetic writings—in particular, the debarim ("words" or "history") of Jehu the son of Hanani (2 Chron. xx. 34) and possibly the vision of Isaiah (2 Chron. xxxii. 32). Where the chronicler does not cite this comprehensive work at the close of a king's reign he generally refers to some special authority which bears the name of a prophet or seer (2 Chron. ix. 20; xii. 15, &c.). But the book of the Kings and a special prophetic writing are not cited for the same reign. It is therefore probable that in other cases than those of Jehu and Isaiah the writings of, or rather, about the prophets which are cited in Chronicles were known only as parts of the great "book of the Kings." Even the genealogical lists may have been derived from that work (1 Chron. ix. 1), though for these other materials may have been accessible.

The two chief sources of the canonical book of Kings were entitled "Annals (events of the times)" of the Kings of Israel and Judah (2 Kings xiii. 22). That the lost source of the Chronicles was not independent of these works appears probable both from the nature of the case and from the close and often verbal parallelism between many sections of the two Biblical narratives. But while the canonical book of Kings refers to separate sources for the northern and southern kingdoms, the source of Chronicles was a history of the two kingdoms combined, and so, no doubt, was a more recent work which in great measure was doubtless based upon earlier annals. Yet it contained also matter not derived from these works, for it is pretty clear from 2 Kings xxv. 17 that the Annals of the Kings of Judah gave an account of Manasseh's repentance, which, according to 2 Chron. xxxiii. 18, 19, was narrated in the great book of the Kings of Israel. It was the opinion of Bertheau, Keil and others, that the parallels of Chronicles with Samuel and Kings are sufficiently explained by the ultimate common source from which both narratives drew. But most critics hold that the chronicler also drew directly from the canonical books of Samuel and Kings as he apparently did from the Pentateuch. This opinion is not improbable, as the earlier books of the Old Testament cannot have been unknown in his age; and the critical analysis of the canonical book of Kings is advanced enough to enable us to say that in some of the parallel passages the chronicler uses words which were not written in the annals but by one of the compilers of Kings himself. In particular, Chronicles agrees with Kings in those short notes of the moral character of individual monarchs which can hardly be ascribed to an earlier hand than that of the redactor of the latter book.

For the criticism of the book it is important to institute a careful comparison of Chronicles with the parallel narratives in Samuel and Kings: (1) The addition of 2 Chron. xxxii. 18, 19, Chronicles directly contradicts the earlier books there are few in which an impartial historical judgment will decide in favour of the later account, and in any point that touches difference of usage between its time and that of the old monarchy it is of no authority. The characteristic feature of the post-exilic age was the re-shaping of older tradition in the interest of parietic and practical purposes, and for this object a certain freedom of literary form was always allowed to ancient historians. The typical speeches in Chronicles are of little value for the periods to which they relate, and where they are inconsistent with the evidence from earlier writings or contain inherent improbabilities are scarcely of historical worth. According to the ordinary laws of research, the book, being written at a time long posterior to the events it records, can have only a secondary value, although that is no reason why here and there valuable material should not have been preserved. But the general picture which it gives of life under the old monarchy cannot have the same value for us as the records of the book of Kings. On the other hand, it is distinctly the work of the time, and as such can be taken as a characteristic picture of the spirit of the age. The ecclesiastical chronicle of Jerusalem, as Reuss has aptly called it, represents the culminating point (as far as the O. T. Canon is concerned) of that theory of which examples recur in Judges, Samuel and Kings, and this treatment of history in accordance with religious or ethical doctrines finds its continuation in the didactic aims which characterize the later non-canonical writings (cf. Jubilees; Midrash).

The most prominent examples of disagreement with earlier sources may be briefly noted. Thus, it would appear that the book has confessed Jehoiakim and Jehoiachin (2 Chron. xxxvi. 7-8) and has statements which directly conflict with 2 Sam. xxi. 19 (1 Chron. xx. 5; see Goliath), and 1 Kings ix. 10 seq. (2 Chron. viii. 2); it has changed Hezekiah's submission (2 Kings xviii. v.) into a payment of tribute by this king and by Josiah (2 Kings xii. 18; 2 Chron. xxiv. 23 sqq.). That Satan, and not Yahweh incited

1 R.V. "commentary," properly, an edifying religious work, a didactic or homiletic exposition. A distinct tendency to Midrash is found even here and there in the earlier books.

2 The problem of the sources is one of considerable intricacy and cannot be discussed here; the introduction to the commentaries of Benzing and Kittel (see Bibliography below) should be consulted.

3 The question of the identity of the Chronicler is discussed by Zahl, "Die Astronomie," pp. 21 sqq., and below, p. 94 seqq.

4 The present author, pp. 23 sqq. have shown that the Chronicler's account of the city's wonderful deliverance mentioned in Kings (see Huzzai) and the details of the invasion of Judah in the time of Jehoiakim differ essentially from those in the earlier source. Even 2 Chron. viii. 2 cannot be regarded as a deliberate alteration since the writer does not appear to be quoting from 1 Kings ix. 10 seq. (the two passages should be carefully compared), and his view of Solomon's greatness is already supported by allusions in the earlier but externally composite sources in Kings (see Solomon).
David to number Israel (1 Chron. xxi; 2 Sam. xxiv) and record their previous genealogical traditions.

A particular tendency to arrange history according to a mechanical rule appears in the constant endeavour to show that recompense and punishment are uniformly found in God's dealings with the nations, and especially on obedience or disobedience to prophetic advice. Thus, the invasion of Shishak (see ROMAN) becomes a typical romance (2 Chron. xii.); the illness of Asa is preceded by a denunciation for relying upon Syria, and the chronology is changed to bring the fault nearer to the event (cf. xxix. 36; xxii. 31). But Jehosaphat that made war at Elom-jebur because he had allied himself with Ahaziah of Israel despite prophetic warning (2 Chron. xx. 35 sqq.; 1 Kings xxii. 48; cf. similarly the addition in 2 Chron. xxix. 1-21; cf. xxv. 35).

The Edomites revolt only after the triumph of the Edomites over the Ammonites and the battle of Edom (2 Chron. xx. 10-20; 2 Kings viii. 22). Ahaziah was slain because of his friendship with Jehoram (2 Chron. xxiii. 7). The Aramaean invasion in the time of Josiah of Judah was a punishment for the murder of Jehoiada's son (2 Chron. xxii.; 2 Kings xxiii. 24-27). After defeating Edom (2 Chron. xxvi., esp. verses 19-21; see 2 Kings xiv. 10 seq.), worshipped strange gods, for which he was defeated by Joash of Israel, and subsequently met with his death (2 Chron. xxiv. 27; 2 Kings xiv. 19). Uzziah's leprosy is attributed to a ritual fault (2 Kings xvi. 15; 2 Chron. xxvi. 19 seq., 3-5). The defeat and death of the good king Joash came through disobedience to the Divine will (2 Chron. xxxiv. 1 seq.; see 2 Kings xxiii. 26 sqq.

In addition to such supplementary information, another tendency of the chronicler is the alteration of narratives that do not agree with the later doctrines of the union of religious institutions before and after the exile. Thus, the reformation of Josiah has been thoroughly altered (2 Kings xxii. 1-20), and Jonah's strange prophecy (cf. xxiv. 3-6; 2 Kings xxiv. 25-31) has been replaced by a more favorable one. The latter contains a painful subject upon which the chronicler's age did not care to dwell (contrast 2 Kings xxiv. 8-xxv. with the brief 2 Chron. xxxvi. 9-21). At an age when the high places were regarded as idolatrous it was considered only natural that the good kings should not tolerate them. So 2 Chron. xv. 5, xvi. 6 (from unknown sources) contradicts 1 Kings xv. 14, xii. 43 (that Asa and Jehoshaphat did not demolish the high places, whereas xv. 16-18, xx. 31-34, are quoted in a different context). See also 2 Kings xiii. 11, 24, and the classic version of the simple methods of early compilers. Further, it is assumed that the high place at Gibeah was a legitimate sanctuary (2 Chron. i. 6-5; 1 Kings ii. 2-4; 1 Chron. xxvi. 25-30; 2 Sam. xxiv.); that Jeroboam was born not by priests (1 Kings viii. 5) but by Levites (2 Chron. iii. 16), and that his usurpation was supported by the Levites, and not the foreign bodyguard of the temple, helped to place Joash on the throne (2 Chron. xxiii.).

Conversely 1 Chron. xv. 12 seq. explains xii. 10 (2 Sam. vi. 7) on the view that Uzzaz was not a Levite, but the catastrophe.

It was generally the case, therefore, that Levitical names often proves the lateness of the source, although an appreciation of the principles of genealogies sometimes reveals important historical information; see CLEOPATRA, GENEALOGY, JUDAH. But the Levitical system as it appears in its most complete form in Chronicles is the result of the development of earlier schemes, of which some traces are still preserved in Chronicles itself and in Ezra-Nehemiah. (See further LEVITICS.)

The tendency of numbers to grow is one which must always be kept in view—cf. 1 Chron. xvii. 4, 26; 2 Sam. ix. 9, 24; consequently little importance can be attached to details which appear to be exaggerated (1 Chron. v. 21, xxi. 14; 2 Chron. xiii. 3, 17), and are found to be quite in accordance with similar peculiarities elsewhere (Num. xxv. 1-5). But when allowance is made for all the abundant evidence of the late post-exilic age, there remains a certain amount of additional matter in Chronicles which may be derived from relatively old sources. These items are of purely political or personal nature and contain several details which taken by themselves have every appearance of genuineness. Where there can be no suspicion of such "tendency" as has been noticed above there is less ground for scepticism, and it must be remembered that the earlier books contain only a portion of the material to which the compilers had access. Hence it may well happen that the details which unfortunately cannot be checked were ultimately derived from sources as reputable as those in the books of Samuel, Kings, &c. As examples may be cited Rehoboam's buildings, &c (2 Chron. xi. 12, 18 sqq.); Jeroboam's attack upon Abijah (2 Chron. xii., cf. 1 Kings xvii. 7); the invasion of Zerah in Asa's reign (2 Chron. xiv.; see Asa); Jehoshaphat's wars and judicial measures (2 Chron. xvii. xx.; see 1 Kings xxii. 45); Jehoram's family (2 Chron. xxii. 2-4); relations between Jehoiada and Joash (2 Chron. xxiv. 3, 15 sqq.); conflicts between Eshai and Judah (2 Chron. xxiv. 6-13); wars of Uzziah and Jotham (2 Chron. xxvi. seq.); events in the reign of Ahaz (2 Chron. xxvi. 15, 18 seq.); reforms of Hezekiah (2 Chron. xxix. seq., cf. Jer. xxxix. 3); repertory and buildings (2 Chron. xxxiii. 10-20; see 2 Kings xxii and xxiii); the death of Josiah (2 Chron. xxxv. 20-25). In addition to these, the reference may be made to such tantalizing statements as those in 1 Chron. ii. 23 (R.V.), iv. 39-41, v. 18, 18-27, vii. 21 seq., viii. 13, xiii. 11, examples of the kind of tradition, national and private, upon which writers could draw. Although in their form the additional narratives in the chronicle's style, it is not necessary to deny an older traditional element which may have been preserved in sources now lost to us.

BIBLIOGRAPHY.—Robertson Smith's article in the 9th ed. of the Ency. Brit. was modified by his later views in Old Test. in the Jewish Church (1900). H. Tristram in his First Visit to the Holy Land (1878) and Driver in his revision of Smith's article in Ency. Bib. and his Lit. of Old Test., and by F. Brown in Hastings' Dict. Bib. (a very comprehensive article). Many parts of the book offer a very hard task to the exercise of genealogies, where to other troubles are added the extreme corruption and many variations of the proper names in the versions; on these see the articles in the Ency. Bib. Valuable contributions to the exegesis of the book will be found in Wellhausen's Prolegomena (Eng. trans.), pp. 171-227; Benzing in Marti's Hand-Kommentar (1901); Kittel in Sacred Books of the Old Test. (1895), History of the Hebrews, ii. 224 sqq. (1896), and in Nowack's Hand-Kommentar (1902). W. H. Bennett in Expositor's Bible (1904), W. E. Burnes in Cambridge Bible (1899), and in the Dictionary of the Bible (1902), are helpful. Among more recent investigations are those of Howorth, Proc. Soc. Bibl. Archæol. xxvii. 267-278 (Chronicles a late translation from the Aramaic). (W. R. S.: S. A. C.)

CHRONOGRAPH from G. χρονογραφία, time, and γράφειν, to write. Instruments whereby periods of time are measured and recorded are commonly called chronographs, but it would be more correct to give the name to the records produced. Instruments such as "stop watches" (see WATCH), by means of which the time between events is shown on a dial, are also called chronographs; these are sometimes lightly called chronoscopes (see READER). But the view that the earlier documents on which these are based are precisely as conceived, and in the present stage of historical criticism is unsound as an implicit reliance upon those sources in the earlier books, which in their turn are often long posterior to the events they record. Although Graf, in a critical and exhaustive study Geschichtlicher Bücher des A.T. (1875; 1876), concluded that the Chronicles have almost no value as a documentary source of the ancient history, he subsequently admitted in private correspondence with Bertheau that this statement was too strong (preface to Bertheau's Commentary, 2nd ed., 1879).
In the first experiments in ballistics by B. Robins, Count Rumford and Charles Hutton, the velocity of a projectile was found by means of the ballistic pendulum, in which the principle of momentum is applied in finding the velocity of a projectile (Principles of Gunnery, by Benjamin Robins, edited by Hutton, 1805, p. 84). It consisted of a pendulum of considerable weight, which was displaced from its position of rest by the impact of the bullet, the velocity of which was required. A modification of the ballistic pendulum was also employed by W. E. Metford (1824-1899) in his researches on different forms of rifling; the bob was made in the form of a long cylinder, weighing about 140 lb, suspended with its axis horizontal from four wires at each end, all moving points being provided with knife edges. The true length of suspension was deduced from observations of the time of a complete small oscillation. The head of the pendulum was furnished with a wooden block, which caught the fragments of bullets fired at it, and its displacement was recorded by a rod moved by the bob (The Book of the Rifle, by the Hon. T. F. Fremantle, p. 336). An improved ballistic pendulum in which the geometric method of suspension is introduced has been used by A. Mallock, to determine the resistance of the air to bullets having a velocity up to 4,500 F/S (Proc. Roy. Soc., Nov. 1904). A ballistic pendulum, carried in his research on the elasticity of golf balls, also employed by C. V. Boys in a study of the geometric suspension of pendulums, was employed by E. J. Grobert, in a research on the electricity of glass balls, the displacement of the bob being recorded on a sheet of smoked glass.1 For further information on the dynamics of the subject see Text Book of Gunnery, 1897, p. 101.

In nearly all forms of chronographs in which the ballistic pendulum method is not used, the beginning and end of a period of time is recorded by means of some kind of electrically controlled mechanism; and in order that small fractions of a second may be measured, tuning-forks are employed, giving any convenient number of vibrations per second, a light style or scribbling point, usually of aluminum, being attached to one of the legs of the tuning-fork. A trace of the vibration is made on a surface blackened with the deposit from the smoke of a lamp. Glazed paper is often employed when the velocity of the surface is slow, but when a high velocity of smoked surface is necessary, smoked glass offers far the least resistance to the movement of the scribbling points. If the surface be cylindrical, thin sheet mica-attached to it, and smoked, gives excellent results, and offers little resistance to all the scribbling points employed. The period of vibration of tuning-forks is determined by direct or indirect comparison with the mean solar second, taken from a standard clock, the rate of which is known from transit observations (• Recherches sur les vibrations d’un diapason étalon,” R. Koenig, Wied. Ann., 1886). In the celebrated ballistic experiments of the Rev. F. Bashforth, the time markings were made electrically from a standard clock, and fractions of a second were estimated by interpolation. Regnault (Mémoires de l’Acad. des sciences, t. xxxvii.) employed both a standard clock and a tuning-fork in his determination of the velocity of sound. The effect of temperature on tuning-forks has been determined by Lord Rayleigh and Professor H. McLeod (Proc. Roy. Soc., 1880, 26, p. 162), who found the coefficient to be 0-0001 per degree C. between 20° C. and 27° C. The beginning and end of a time period is marked on a moving surface in many ways. Usually an electromagnetical stylus is employed, in which a scribbling point suddenly moves when the electric circuit is broken by a projectile. Another method is to arrange the terminals of the secondary circuit of an induction coil, so that when the primary circuit is opened a small spark punctures or marks a moving surface (Helmholtz, Phil. Mag., 1853, p. 6). A photographic plate or film, moving in a dark chamber, is also used to receive markings produced by a beam of light interrupted by a small screen attached to an electromagnetical stylus, or by the legs of a tuning-fork, or by the mercury column of a capillary electrometer. In certain researches on the explosive wave of gases the light given by the burning gases made the time trace on a rapidly moving photographic film (H. B. Dixon, Phil. Trans., 1903, 200, p. 352). In physiological chronography the stylus is in many cases actuated directly by the piece of muscle to which it is attached; when the muscle is stimulated its contraction moves the stylus on a moving surface of the myograph (Muscle and Brain, by H. G. Daboz, 1879, p. 133).

Gun Chronographs.—Probably the earliest forms of chronographs, not based on the ballistic pendulum method, are due to Colonel Grobert, 1804, and Colonel Dabooz, 1818, both officers of the French army. In the instrument by Grobert two nails were attached with the same axle, thus: the one close to the gun, the other at a given distance from it, was stretched by a weight at the gun end and by a heavy screen at the other end. Behind this screen there was a fixed screen. The shot cut the cord and liberated the screen, which was perforated during its fall. The heavy cord and screen were separated by a small distance, one of the nails being made a photographic screen upon that in the fixed one. This gave the approximate time of flight of the shot over a given distance, and hence its velocity.

The early form of chronoscope invented by Sir C. Wheatstone in 1840 the period of time was measured by means of a species of clock, driven by a weight; the dial pointer was started and stopped by the action of an electromagnet which moved a pawi engaging with a toothed wheel fixed on the axle to which the dial pointer was attached. The instrument applied to the determination of the velocity of shot is described thus by Wheatstone:—"A wooden ring embraced the mouth of the gun, and a wire connecting the ring with the opposite extremity of the electromagnetic was caused to pass over the axis of the gun. The other extremity of the electromagnet were attached two wires, one of which communicated with the contact piece of the target, and the other with one of the ends of the wire stretched across the mouth of the gun; before the firing of the gun a continuous circuit existed, including the gun wire; when the target was fired the electromagnet cut the circuit, the passage of the projectile both circuits were interrupted, and the duration of this interruption was indicated by the chronoscope.”

Professor Joseph Henry (Journal Franklin Inst., 1860) employed a cylindrical cavity driven by clockwork, which is the primary of the coil being in circuit with a battery and screen. This form of chronograph is in many respects similar to the instrument of Konstantinoff, which was constructed by L. F. C. Breguet and has been in use for many years. The instrument employed was a cylinder of t in circumference and 0.16 metre long, driven by clockwork, the rotation being regulated by a governor provided with wings. A small carriage geared to the wheel, traversed its length carrying electromagnetic signals. The electric chronograph signal usually consists of a small armature (furnished with a style which marks a moving surface) moving in front of an electromagnet, the armature being suddenly pulled off the end of the electromagnet by a spring when the circuit is broken (Journal of Physiology, ix, 499). The signals in Breguet's instrument were in a circuit, including the screens and batteries of a gun range. The measurement of time depended on the
The regularity of rotation of the cylinder, on which each mm. represents 1/250 second.

In the chronograph of A. J. A. Navez (1848) the time period is found by means of a pendulum held at a large angle from the vertical by an electromagnet, which in contact with the cylinder, produces the impulse. The pendulum is released by a small electric spark on a divided arc. The time of travel of the pendulum is deduced from that of the cylinder. When the pendulum has traversed half a revolution and the impulse is repeated, the time is noted and the process is repeated until the greatest accuracy is obtained.

Navez.

In Navez's chronograph (1859) two pendulums are used, one on the cutting of the first screen, the other on the cutting of the second screen. The difference between the swings of the two pendulums gives the time period sought for. The instrument is employed for the determination of the distention of the glass of a cylinder of water, for determining the time required for a given distance between the screens, the velocity of a shot at once found. It may be noted that the method of release is such that the falling time can be made practically instantaneous and the velocity is determined by the velocity of the falling weight, which is measured by distance and by means of a scale, graduated for a given distance between the screens.

Watkin.

The weight is furnished with an insulated wire which passes through it at right angles to its longest axis. When the weight falls the ends of the insulated wire move very close to the horizontal cylinder of the chronograph, and the induced current is measured by an induction coil, the primary circuit of which is opened when a screen is ruptured by a shot. A minute mark is made by the induced spark on the paper with which the cylinders are covered. Two seconds, and between events is deduced from the time between this mark and the next.

In the Bashforth chronograph a platform, arranged to descend slowly along a vertical rotating cylinder, carries two markers controlled by electromagnets, which describe a double spiral on the paper. The wire attached to the first marker is cut on the cylinder. The cylinder is divided into sections by marks, and the time is deduced from the number of sections traversed by the markers. The wire is divided into sections by marks, and the time is deduced from the number of sections traversed by the markers.

The chronoscope invented by Sir Andrew Noble is so well adapted to the measurement of velocity, that it is found practically to the ten thousandths of a second.

Noble.

Different parts of the marks in the chronoscope are used. The wire of the first spiral is made of tinplate, and of the second spiral of the cylinder. A thin metal rod is placed in the second spiral, and the marks are then drawn as follows: When the wires are brought together, the first flag is raised, and the second flag is raised when the wire is brought to a horizontal position. The time is then deduced from the marks on the cylinder and the wire which forms the first spiral.

In the chronoscope the lines of the cylinders are marked by means of a small knife which cuts into the face of the cylinder. The knife is held against the cylinder and the marks are made by a spring applied to the knife, and the marks are then traced on the cylinder. The time is then deduced from the marks on the cylinder.

very close readings are required, they are made by means of a traversing geometric micrometer microscope. When the distance between the screens is known, and also the time of flight, the midpoint velocity is found by applying Baschelt’s formula. When the velocity exceeds 1000 feet per second, a gun is fired; the bullet goes through a tunnel which leads across the muzzle takes the place of the first screen, and a thin sheet of metal or cardboard carrying an electric contact, or a Brany coil, the conductivity of which is restored by means of an induced current, is introduced. When the bullet passes through the tunnel, the circuit is provided with a safety key attached by a cord to the man who loads the gun and prepares the electric fuse. The firing circuit is closed by inserting the key in a switch at the rear of the gun, thus completing the circuit which energizes the spark gap between the gun is fired by the chronograph. The tram, when the instrument is adjusted, has a practically constant velocity of traverse.

The polarizing-photo-chronograph, designed and used by A. C. Crochere and G. O. Squier of the United States Artillery (T. Am. Acad. Inst. Elect. Eng. vers. 4, and Journal United States Artillery, 1895, 6, p. 271), depends for its indications upon the rotation of a beam of light by a magnetic field, produced by a solenoidal current which is opened and closed just before and after the gun is fired. The light is as follows:—A beam of light from an electric lamp traverses a lens, then a Nicol prism, next a glass cylinder furnished with plane glass ends and coiled with insulated wire, then an analyser and two lenses, then through a photographic screen. A photograph of the screen is given by an electric motor, the plane of rotation being perpendicular to the direction of the beam of light. The same plate also records the shadow of a pierced projection attached to a tuningfork—light from the lamp being deflected by magnetic force to a wire forming part of the purpose. The solenoid used to produce a magnetic field across the glass cylinder, which is filled with carbon bisulphide, is in circuit with a dynamo, resistances, and the screens on the gun range. It is a means of determining in photographic plates the time intervals of polarizations of Nicol prism and analyser, the light is shut off by rotating the analyser, it is instantly restored when the carbon bisulphide is placed in a magnetic field. This phenomenon is of great advantage when the instrument is made portable. The variation of screens, causes the magnetic field to cease and light to pass. By means of an automatic switch the projectile, after cutting a screen, restores the electric circuit, so that successive records are registered. A later modification of the instrument consists in replacing the photographic microscope, the angle moved through by the photographic disk is found, and hence the time period between two events. In the photochronograph described in Untersuchungen über die Vibration des Gesellschaftsprognostikers, und her beobachteten magnetischen Feldes, note on the same, Nature, 61, p. 55, a sensitive plate moving in a straight line receives the record of the movement of the barrels of firearms when discharged. It was mainly used to determine the angle or error of departure in ballistics.

In a second chronograph by Watkin ("Chronograph and their Application to Gun Ballistics," Proc. Roy. Inst., 1896), a metal drum, divided on its edge so that when a vernier is a minute later that reading is made by the mark, practically unreadable. The points of a row of steel-pointed pins, screwed into a frame of ebony, can be brought within 0.008 in. of the surface of the drum. Each pin is part of the cylinder, the circle formed by the axis of an induction coil, the space between the pins and the drum forming a space between them. The drum is rubbed over a wax solution of paraffin wax in benzol, which causes the markings produced by the pins to be well defined. The records are read by means of a fine wire stretched along the drum and just clear of it, the dots being taken up with the hair by the microscope. The velocity of rotation is found by obtaining spark marks, due to the primary circuit of two induction coils being successively broken with a weightless, or the two electric circuits of the coils in succession at the height of the drum. This is done by finding the velocity of projectiles after leaving the gun, and also for finding the rate at which a shot traverses the bore. For the latter purpose the shot successively cuts insulated wires placed in the paths of parallel light beams, the wire forming part of the primary of an induction coil, and as each is cut a dot is made on the rotating drum by the induced spark.

In the chronograph of Marcel Depey, a cylinder for receiving records is divided into a large number of rings, each divided in a hundred parts, by means of a circle longer than the cylinder, mounted parallel to the axis of the cylinder and rotated by the clockwork, a carriage is made to traverse close to the paper. In some instruments this carriage is furnished with a metal point, and in others with a style.
closing of the current by electrical contacts attached to diaphragms on which the sound wave acted. The contacts consisted of minute Hammond fastening on metal points fixed to the centre of diaphragms which closed the end of the experimental pipe. The signal marked the instant at which a dot mark was shown on a disc with a small hole in it. The disc rotated on the upper hand band gave the period of time between two events, and the number of vibrations of the tuning-fork per second was estimated by means of markings due to the clock. The sound wave was usually originated by firing a piston into the pipe furnished with diaphragm-cutting point pieces.

In the chronographic use of the Morse telegraph instrument (Stewart and Gee, *Elementary Practical Phys. p. 234*) a circuit is arranged which includes a seconds’ pendulum, in which the hammer, which sweeps through a small mass of mercury forming a part of the circuit. There is a Morse key for closing the circuit. A fast-running Morse instrument and a battery are placed across this circuit as a short circuit, and the current is shut off by the Morse key, which is being closed by the pendulum, and the space between each adjacent dot indicates a period of one second’s duration. Also, when the key is depressed, a mark is made on the paper. To measure a period of time, the key is depressed at the moment when the pendulum is at bottom, causing two dots to be made on the ribbon; the interval between these, when measured by the intervals due to the pendulum, gives the length of the period in seconds, and also in fractions of a second, when the pendulum is subdivided into hundred of a second.

This apparatus has been used in determination of the velocity of sound. In the break circuit arrangement of pendulum key and Morse instrument the markings appear as breaks in a line which would otherwise be a continuous line. The electrical effect on a platinum wire was noted by W. E. Ayrton and J. Perry in their determination of the acceleration of gravity at Tokio, 1877-1878 (*Proc. Phys. Soc. Lond., 3*, p. 268).

In the tuning-fork electro-chronograph attributed to Hipp a metallic cylinder, containing a smoked paper strip, is placed on the pendulum, and, being struck by clockwork, a tuning-fork armed with a metallic style, being so adjusted that it makes a clear fine line on the smoked paper. The tuning-fork is placed in the secondary circuit of an induction coil, such that when the broken circuit is broken, the induced spark moves a speck of black from the paper and leaves a mark. The time period is deduced by counting the number of vibrations and fractions of vibrations of the tuning-fork as recorded by a sinusine line on the cylinder, which is at first blackened, and the marks are the break of the cylinder, which is fixed at one end, and a spiral line is traced. To obtain good results the marks must be very small, for when large it often leaves a mark from the end of the style, and does not give the true position of the style when the pendulum is broken.

The arrangement of pendulum and revolving cylinder, with the addition of a standard clock, has been used by A. M. Mayer (*Trans. Nat. Acad. Sci. U.S.A. vol. iii.*) and others for calibrating tuning-forks, and comparing their vibrations directly with the beats of the pendulum. The instrument is subdivided into hundred of a second. The pendulum marks and breaks the primary circuit by carrying a small platinum wire through a small mercury meniscus. Better and apparently certain contacts can be obtained from platinum contact-points, but it is better to use a Bechhold goniometer, which carries the style of the pendulum and the edge of the cylinder, is attached to the centre of the membrane by a short rod, its free end moving as the membrane is subjected. The cylinder is connected by a flexible tube with a similar cylinder of the same material when we wish to determine its period or subdivide it by a fixed mark.

The period of the pendulum myograph or muscle-trace recorder is described in *Vierteljahrschr. der naturforsch. Ges. in Zürich, 1862, S. 307*, and in *Test-book of Physiology*. M. Foster, pp. 42, 45. It was used to obtain a record of the contractions of the heart when the muscle curves its trace. The instrument, according to the electro-ballistic chronograph of Navez, a long pendulum, consisting of a brass metal frame, carries at its lower end a sheet of smoked glass. The pendulum swings through arcs of 180°, and is divided by contact points, by a spring catch; when this is depressed it is free to swing. At the end of its swing it engages with another spring catch. In front of the moving arm of the pendulum, an oblique little window is placed, and a red image of the style, the position of the window of the tuning-fork and of the lever attached to the muscle, and also the trace of an electromagnetic signal which marks the instant at which the primary circuit is broken. After the traces are made, they are ruled through with radial lines, cutting the three traces into pieces of different length. The time of the vibration of the tuning-fork is measured in terms of the period of vibration of the tuning-fork, as in other chronographs in which the tuning-fork is employed.

In the spring myograph of E. Du Bois Reymond (*Munk’s Physiologische Methoden*), a small quartz tuning-fork is attached to the muscle, and the style of a tuning-fork is shot by a spiral spring along two guides with a velocity which is not uniform. The traces of a style moved by the muscle under examination, and of a tuning-fork, are recorded on the glass. The velocity of the style, knocking over one or more electric keys, which break the primary circuit of an induction coil, the induced current stimulating the muscle.

In the photo-electric chronograph devised by G. J. Burch, F.R.S. (*Journal of Physiology*, 18, p. 125; *Electrician*, 37, p. 436), the rapid movements of the column of mercury in a capillary electroscope used in physiological research are recorded on a sensitive plate. The method is to place a diaphragm of fine wire between the tuning-forks, so that the vibrating prongs of a tuning-fork of known period is also recorded on the plate, the light used being that of the electric arc. The images of the mercury column and of the moving fork are focussed on the plate by a lens. Excellent results have been obtained with this instrument.

An important development of a branch of chronography is due to E. I. Marey (Comptes rendus, 7, août 1883, and *Le Mouvement*, par E. I. Marey, Paris, 1884). Marey constructed a diaphragm and a plate for receiving successive pictures of moving objects, at definite times, when investigating the movements of animals, birds, fishes, insects, and also microscopic objects such as vorticellae. The instrument is called by Marey a chronograph, and consists of a plate under a glass cover, in front of the sensitive plate and close to it a disk, pierced with radial slits, revolving at a given angular velocity, and each time a slit passed by the plate was exposed. But since, in the time of passage of the space between the slits, the object had moved by a certain amount across the field the "free" fraction of the exposure was produced at each exposure. The object, well illuminated by sunlight, moved in front of a black background. Since the angular velocity of the disk was known, and the number of slits, the time between the successive positions of the image of the object in the plate was

CHRONOLOGY

The invention of letters the memory of past transactions could not be preserved beyond a few years with any tolerable degree of accuracy. Events which greatly affected the physical condition of the human race, or were of a nature to make a deep impression on the minds of the rude inhabitants of the earth, might be vaguely transmitted through several ages by traditional narrative; but intervals of time, expressed by abstract numbers, and these constantly varying besides, would soon escape the memory. The invention of the art of writing afforded the means of substituting precise and permanent records for vague and evanescent tradition; but in the infancy of the world, mankind had learned neither to estimate accurately the duration of time, nor to refer passing events to any fixed epoch.

For these reasons the attempt at an accurate chronology of the early ages of the world is only of recent origin. After political relations began to be established, the necessity of preserving a register of passing seasons and years would soon be felt, and the practice of recording important transactions must have grown up as a necessary consequence of social life. But of these deliberate early records a very small portion only has escaped the ravages of time and barbarism. The earliest accounts of the Greeks, Etruscans and Romans are irretrievably lost. The traditions of the Druids perished with them. A Chinese emperor has the credit of burning "the books" extant in his day (about 220 B.C.), and of burying alive the scholars who were acquainted with them. And a Spanish adventurer destroyed the picture records which were found in the pueblo of Montezuma.

Of the more formal historical writings in which the first ineffectual attempts were made in the direction of systematic chronology we have no knowledge at first-hand. Of Hellanicus, the Greek logographer, who appears to have lived through the greater part of the 5th century B.C., and who drew up a chronological list of the priestesses of Hera at Argos; of Ephorus, who lived in the 4th century B.C., and is distinguished as the first Greek who attempted the composition of a universal history; and of Timaeus, who in the following century wrote an elaborate history of Sicily, in which he set the example of using the Olympiads as the basis of chronology, the works have perished and our meagre knowledge of their contents is derived only from fragmentary citations in later writers. The same fate has befallen the works of Berossus and Manetho, Eratosthenes and Apollodorus. Berossus, a priest of the Great Gods, wrote in the 3rd century B.C., added to his historical account of Babylonia a chronological list of its kings, which he claimed to have compiled from genuine archives preserved in the temple. Manetho, likewise a priest, living at Sebennytus in Lower Egypt in the 3rd century B.C., wrote in Greek a history of Egypt, with an account of its thirty dynasties of sovereigns, which he professed to have drawn from genuine archives in the keeping of the priests. Of these works fragments only, more or less copious and accurate, have been preserved. Eratosthenes, who in the latter half of the 2nd century B.C. was keeper of the famous Alexandrian library, not only made himself a great name by his important work on geography, but by his treatise entitled Chronographia, one of the first attempts to establish an exact scheme of general chronology, earned for himself the title of "father of chronology." His method of procedure, however, was usually conjectural; and guess-work, however careful, acute and plausible, is still guess-work and not testimony. Apollodorus, an Athenian who flourished in the middle of the 2nd century B.C., wrote a metrical chronicle of events, ranging from the supposed period of the fall of Troy to the end of the day. These works were followed by other investigators and systematizers in the same field, but their works are lost. Of the principal later writers whose works are extant, and to whom we owe what little knowledge we possess of the labours of their predecessors, mention will be made hereafter.

The absence or incompleteness of authentic records, however, is not the only source of obscurity and confusion in the chronology of remote ages. There can be no exact computation of time or placing of events without a fixed point or epoch from which the reckoning takes its start. It was long before this was apprehended. When it began to be seen, various epochs were selected by various writers; and at first each small separate community had its own epoch and method of time-reckoning. Thus in one city the reckoning was by succession of kings, in another by archons or annual magistrates, in a third by succession of priests. It seems now surprising that vague counting by generations should so long have prevailed and satisfied the wants of inquiring men, and that so simple, precise and seemingly obvious a plan as counting by years, the largest natural division of time, did not occur to any investigator before Eratosthenes.

Precision, which was at first unattainable for want of an epoch, was afterwards no less unattainable from the multiplicity, and sometimes the variation, of epochs. But by a natural process the mischief was gradually and partially remedied. The extension of intercourse between the various small groups or societies of men, and still more their union in larger groups, made a common epoch necessary, and led to the adoption of such a starting point by each larger group. These leading epochs continued in use for many centuries. The task of the chronologist was thus simplified and reduced to a study and comparison of dates rather than epochs.

The most important of these systems in what we call ancient times were the Babylonian, the Greek and the Roman. The Jews had no general era, properly so called. In the history of Babylonia, the fixed point from which time was reckoned was the era of Nabonassar, 747 B.C. Among the Greeks the reckoning was by Olympiads, the point of departure being the year in which Coroebus was victor in the Olympic Games, 776 B.C. The Roman chronology started from the foundation of the city, the year of which, however, was variously given by different authors. The most generally adopted was that assigned by Varro, 753 B.C. It is noteworthy how nearly these three great epochs approach each other,—all lying near the middle of the 8th century B.C. But it is to be remembered that the beginning of an era and its adoption and use are not the same thing, nor are they necessarily synchronous. Of the three ancient eras above spoken of, the earliest is that of the Olympiads, next that of the foundation of Rome, and the latest the era of Nabonassar. But in order of adoption and actual usage the last is first. It is believed to have been in use from the year of its origin. It is not known when the Romans began to use their era. The Olympiad is now in current use till about the middle of the 3rd century B.C., when Timaeus, as already mentioned, set the example of reckoning by them.

Even after the adoption in Europe of the Christian era, a great variety of methods of dating—national, provincial and ecclesiastical—grew up and prevailed for a long time in different countries, thus renewing in modern times the difficulties experienced in ancient times from diversities of reckoning. An acquaintance with these various methods is indispensable to the student of the charters, chronicles and legal instruments of the middle ages.

In reckoning years from any fixed epoch in constant succession, the number denoting the years is necessarily always on the increase. But rude nations and illiterates people seldom attach any definite idea to large numbers. Hence it has been a practice, very extensively followed, to employ cycles or periods, consisting of a moderate number of years, and to distinguish and reckon the years by their number in the cycle. The Chinese and other nations of Asia reckon, not only the years, but also the months and days, by cycles of sixty. The Saros of the Chaldaeans, the Olympiad of the Greeks, and the Roman Indiction are instances of this mode of reckoning. Several cycles were formerly known in Europe; but most of them were invented for the purpose of adjusting the solar and lunar divisions of time, and were rather employed in the regulation of the calendar than as chronological eras. They are frequently, however, of very great use in fixing dates that have been otherwise imperfectly expressed, and consequently form important elements of chronology.
Modern Results of Archaeological Research.

When Queen Victoria came to the English throne, 4004 B.C. was still accepted, in all sobriety, as the date of the creation of the world. Perhaps no single statement could more vividly emphasize the change in the point of view from which scholars regard the chronology of ancient history than the citation of this indisputable fact. To-day, though Biblical are still printed with the year 4004 B.C. in the margin of the first chapter of Genesis, no scholar would pretend to regard this reference seriously. On the contrary, the scholarship of to-day regards the fifth millennium B.C. as well within the historical period for such nations as the Egyptians and the Babylonians. It has come to be fully accepted that when we use such a phrase as "the age of the world" we are dealing with a period that must be measured not in thousands but in millions of years; and that to the age of man must be allotted a period some hundreds of times as great as the five thousand and odd years allowed by the old chronologists. This changed point of view, needless to say, has not been reached without ardent and even bitter controversy. Yet the transformation was unequivocal; and the revised conception no longer seems to connote the theological implications that were at first ascribed to it. It has now become obvious that the data afforded by the Hebrew writings should never have been regarded as sufficiently accurate for the purpose of exact historical computations: that, in short, no historian working along modern scientific lines could well have made the mistake of supposing that the genealogical lists of the Pentateuch afforded an adequate chronology of world-history. But it should not be forgotten that to many generations of close scholarship these genealogical lists seemed to convey such knowledge in the most precise terms, and that at so recent a date as, for example, the year in which Queen Victoria came to the throne, it was nothing less than a rank heresy to question the historical accuracy and finality of chronologies which had no other source or foundation.

This changed point of view regarding the chronology of history may without hesitation be ascribed to the influence of evidence obtained in a single field of inquiry, the field, namely, of archaeology. No doubt the evidence as to the age of the earth and as to the antiquity of man was gathered by a class of workers not formally included in the ranks of the archaeologist: workers commonly spoken of as palaentologists, anthropologists, ethnologists and the like. But the distinction scarcely covers a real difference. The scope of the archaeologist's studies must include every department of the ancient history of man as preserved in antiquities of whatever character, be they tumuli along the Baltic, fossil skulls and grave bones from the caves of France, the flint implements, pottery, and mummies of Egypt, tablets and bas-reliefs from Mesopotamia, coins and sculptures of Greece and Rome, or inscriptions, waxen tablets, parchment rolls, and papyri of a relatively late period of classical antiquity. If at one time the monuments of Greece and Rome claimed the almost undisputed attention of the archaeologist, that time has long since passed. For the most important historical records that have come to us in recent decades we have to thank the Orientalist, though the classical explorer has been by no means idle. It will be sufficient here to point out in general terms the import of the message of archaeological discovery in the Victorian Era in its bearing upon the genealogies and the world-history.

A start was made through the efforts of the palaentologists and geologists, with only indirect or incidental aid from the archaeologists. The new movement began actively with James Hutton in the later part of the 18th century, and was forwarded by the studies of William Smith in England and of Cuvier in France; but the really efficient champion of the conception that the earth is very old was Sir Charles Lyell, who published the first edition of his epoch-making Principles of Geology only a few years before Queen Victoria came to the throne. Lyell demonstrated to the satisfaction, or—perhaps it should rather be said—to the dissatisfaction, of his contemporaries that the story of the geological ages as recorded in the stratata of the earth becomes intelligible only when vast stretches of time are presupposed. Of course the demonstration was not accepted at once. On the contrary, the champions of the tradition that the earth was less than six thousand years old held their ground most tenaciously, and the earlier years of the Victorian era were years of bitter controversy. The result of the contest was never in doubt, however, for the geological evidence, once it had been gathered, was unequivocal; and by about the middle of the century it was pretty generally admitted that the age of the earth must be measured by an utterly different standard from that hitherto in vogue. This concession, however, by no means implied a like change of view regarding the age of man. A fresh volume of evidence required to be gathered, and a new controversy to be waged, before the old data for the creation of man could be abandoned. Lyell again was in the forefront of the progressive movement, and his work on The Antiquity of Man, published in 1863, gave currency for the first time to the new opinions. The evidence upon which these opinions were based had been gathered by such anthropologists as Schmerling, Boucher de Perthes and others, and it had to do chiefly with the finding of implements of human construction associated with the remains of extinct animals in the beds of caves, and with the recovery of similar antiquities from alluvial deposits the great age of which was demonstrated by their depth. Every item of the evidence was naturally subjected to the closest scrutiny, but at last the conservatives were forced reluctantly to confess themselves beaten. Their traditional arguments were powerless before the array of data marshalled by the new science of prehistoric archaeology. Looking back even at the short remove of a single generation, it is difficult to appreciate how revolutionary was the conception of the antiquity of man thus inculcated. It rudely shocked the traditional attitude of scholarship towards the history of our race. It disturbed the most cherished traditions and the most sacred themes. It seemed to threaten the very foundations of religion itself. Yet the present generation accepts the antiquity of man as a mere matter of fact. Here, as so often elsewhere, the heresy of an elder day has come to seem almost an axiomatic truth.

If we go back in imagination to the beginning of the Victorian era and ask what was then known of the history of Ancient Egypt, Mesopotamia and Asia Minor, we find ourselves confronted with a startling paucity of knowledge. The key to the mysteries of Egyptian history had indeed been found, thanks to the recent efforts of Thomas Young and Champollion, but the deciphering of inscriptions had not yet progressed far enough to give more than a vague inkling of what was to follow. It remained, then, virtually true, as it had been for two thousand years, that for all that we could learn of the history of the Old Orient in pre-classical days, we must go solely to the pages of the Bible and to a few classical authors, notably Herodotus and Diodorus. A comparatively few pages sufficed up, in language often vague and mystical, all that the modern world had been permitted to remember of the history of the greatest nations of antiquity. To these nations the classical writers had ascribed a traditional importance, the glamour of which still lighted their names, albeit revealing them in the vague twilight of tradition rather than in the clear light of history. It would have been a bold, not to say a reckless, dreamer who dared predict that any future discoveries could restore to us the lost knowledge that had been forgotten for more than two millennia. Yet the Victorian era was scarcely ushered in before the work of rehabilitation began, which was to lead to the most astounding discoveries and to an altogether unprecedented extension of historical knowledge. Early in the forties the Frenchman Botta, quickly followed by Sir Henry Layard, began making excavations on the site of ancient Nineveh, the name and fame of which were a tradition having scarcely more than mythical status. The spade of the discoverer soon showed that all the fabled glories of the ancient Assyrian capital were founded on realities, and evidence was afforded of a state of civilization and culture such as few men supposed to have existed on the earth before the Golden Age of Greece. Not merely were artistic sculptures and bas-reliefs
found that a high development of artistic genius, but great libraries were soon revealed,—books consisting of bricks of various sizes, or of cylinders of the same material, inscribed while in the state of clay with curious characters which became indelible when baking transformed the clay into brick. No one was able to guess, even in the vaguest way, the exact interpretation of these odd characters; but, on the other hand, one could doubt that they constituted a system of writing, and that the piles of inscribed tablets were veritable books. There were numerous sceptics, however, who did not hesitate to assert that the import of the message so obviously locked in these curious inscriptions must for ever remain an absolute mystery. Here, it was said, were inscriptions written in an unknown character and in a language that for at least two thousand years had been absolutely forgotten. In such circumstances nothing less than a miracle could enable human ingenuity to fathom the secret. Yet the fact pronounced impossible by mid-century scepticism was accomplished by contemporary scholarship, amidst the clamour of opposition and incredulity. Its success contains at once a warning to those doubters who are always crying out that we have reached the limitations of knowledge, and an encouragement and stimulus to would-be experts to forget all such objections.

In a few words the manner of the discovery was this. It appears at a glance that the Assyrian written character consists of groups of horizontal, vertical or oblique strokes. The characters thus composed, though so simple as to their basal unit, are appallingly complex in their elaboration. The Assyrians with all their culture, never attained the stage of analysis which demonstrates that only a few fundamental sounds are involved in human speech, and hence that it is possible to express all the niceties of utterance with an alphabet of little more than a score of letters. Halting just short of this analysis, the Assyrian ascribed syllabic values to the characters of his script, and, hence, instead of finding twenty odd characters sufficient, he required about five hundred. There was a further complication in that each one of these characters had at least two different phonetic values; and there were other intricacies of usage which, had they been foreseen by inquirers in the middle of the 19th century, might well have made the problem of decipherment seem an utterly hopeless one. Fortunately it chanced that another people had arrived upon the scene who were able to make use of the Assyrian as a basis for a written character, and that analysis of which the Assyrians had fallen short, had borrowed only so many characters as were necessary to represent the alphabetical sounds. This made the problem of deciphering Persian inscriptions a relatively easy one. In point of fact this problem had been partially solved in the early days of the 19th century, thanks to the sagacious guesses of the German philologist Grotefend. Working with some inscriptions from Persepolis which were found to contain references to Darius and Xerxes, Grotefend had established the phonetic values of certain of the Persian characters, and his successors were perfecting the discovery just about the time when the new Assyrian finds were made. It chanced that there existed on the polished surface of a cliff at Behistun in western Persia a tri-lingual inscription which, according to Diolorus, had been made by Queen Semiramis of Nineveh, but which, as is now known, was really the work of King Darius. One of the languages of this inscription was Persian; another, as it now appeared, was Assyrian; the language of the third, undiscovered, was found in the libraries of Nineveh. There was reason to suppose that the inscriptions were identical in meaning; and fortunately it proved, when the inscriptions were made accessible to investigation through the efforts of Sir Henry Rawlinson, that the Persian inscription contained a large number of proper names. It was well known that proper names are usually transcribed from one language into another with a tolerably close retention of their original sounds. For example, the Greek names Πτολεμαῖος and Κλεοπάτρα became a part of the Egyptian language and appeared regularly in Egyptian inscriptions after Alexander's general became king of Egypt. Similarly, the Greek names

Khas, Darēs and Xerēs were as close an imitation as practicable of the native names of these Persian monarchs. Assuming, then, that the proper names found in the Persian portion of the Behistun inscription occurred also in the Assyrian portion, retaining virtually the same sound in each, a clue to the phonetic values of a large number of the Assyrian characters was obviously at hand. Phonetic values known, Assyrian was found to be a Semitic language cognate to Hebrew. These clues were followed up by a considerable number of investigators, with Sir Henry Rawlinson in the van. Thanks to their efforts, the new science of Assyriology came into being, and before long the message of the Assyrian books had ceased to be an enigma. Of course this work was not accomplished in a day or in a year, but, considering the difficulties to be overcome, it was carried forward with marvellous expedition. In 1857 the new scholarship was put to a famous test, in which the challenge thrown down by Sir George Cornewall Lewis and Ernest Renan was met by Rawlinson, Hincks, Oppert and Fox Talbot in a conclusive manner. The sceptics had declared that the new science of Assyriology was itself a myth: that the investigators, self-deceived, had in reality only invented a language and read into the Assyrian inscriptions something utterly alien to the mind of the Assyrians. The latter, in conjunction with the Royal Asiatic Society, with George Grote at its head, decided that the translations of an Assyrian text made independently by the scholars just named were at once perfectly intelligible and closely in accord with one another, scepticism was silenced, and the new science was admitted to have made good its claims. Naturally the early investigators did not fathom all the niceties of the language, and the work of grammatical investigation has gone on continuously under the auspices of a constantly growing band of workers. Doubtless much still remains to be done; but the essential thing, from the present standpoint, is that a sufficient knowledge of the Assyrian language has been acquired to ensure trustworthy translations of the cuneiform texts. Meanwhile, the material found by Botta and Layard, and other successors, in the ruins of Nineveh, has been constantly augmented through the efforts of companies of other investigators, and not merely Assyrian, but much earlier Babylonian and Chaldaean texts in the greatest profusion have been brought to the various museums of Europe and America. The study of these languages has, in fact, been made a part of the curriculum of universities, and students have been taught to read in the cuneiform script, and to write in it, the language of a once prosperous and powerful world. The Assyrian scholars have been the most ardent of students in the field of Oriental history, and many have been the contributions which they have made. Their work has been carried on with an accuracy and exactitude which are to be envied by the students of any other ancient language. They have been the most ardent of students in the field of Oriental history, and many have been the contributions which they have made. Their work has been carried on with an accuracy and exactitude which are to be envied by the students of any other ancient language. are Gardner Wilkinson and Professor Flinders Petrie, have brought to light a vast accumulation of new material, much of which has the highest importance from the standpoint of the historian. Lists of kings found on the temple walls at Abydos, in the fragments of the Turin papyrus and elsewhere, have cleared up many doubtful points in the lists of Manetho, and at the same time, as Professor Petrie has pointed out, have proved to us how true a historian that much-discussed writer was. Manetho, it will be recalled, was the Egyptian who wrote the history of Egypt in Greek in the time of the Ptolemies. His work in the original unfortunately perished, and all that we know of it we learn through excerpts made by a few later classical writers. These fragments have until recently, however, given us our only clue to the earlier periods of Egyptian history. Until corroboration was found in the Egyptian inscriptions themselves, not only were Manetho's lists in doubt, but scepticism had been carried to the point of denying that Manetho himself had ever existed. This is only one of many cases where the investigations of the archaeologist have proved not iconoclastic but reconstructive, tending to restore confidence in classical traditions which the scientific historians of the age of Niebuhr and George Cornewall Lewis regarded with scepticism.

As an early explorer, Egypt; theXEZION, Egypt is rather more of vagueness than for the corresponding periods of Mesopotamia. Indeed, approximate accuracy is not attained until we are within sixty or so thousand years of our own era; but the sequence of events of a period preceding this by two or three thousand years is well established, and the recent discoveries of Professor Petrie carry back the record to a period which cannot well be less than five thousand, perhaps not less than six thousand years B.C. Both from Egypt and Mesopotamia, then, the records of the archaeologist have brought us evidence of the existence of a highly developed civilization for a period exceeding by hundreds, perhaps by thousands, of years the term which hitherto had been considered the full period of man's existence.

We may note at once how these new figures disturb the historical balance. If our forerunners of eight or nine thousand years ago were in a noonday glare of civilization, where shall we look for the much-talked-of "dawnings of history"? By this new standard the Romans seem contemporaries in latter-day civilization; the "Golden Age" of Greece is but of yesterday; the pyramid-building era of the ancient Egyptians was built but a short time ago. At Bel at Nippur, in the year (say) 5000 B.C., must have felt themselves at a pinnacle of civilization and culture. As Professor Mahaffy has suggested, the era of the Pyramids may have been the veritable autumn of civilization. Where, then, must we look for its springtime? The answer to that question must come, it must come at all, from what we now speak of as prehistoric archaeology; the monuments from Memphis and Nippur and Nineveh, covering a mere ten thousand years or so, are the records of recent history.

The efforts of the students of Oriental archaeology have been constantly stimulated by the fact that their studies brought them more or less within the field of Bible history. A fair proportion of the workers who have delved so enthusiastically in the fields of Egyptian and Assyrian exploration would never have taken up the work at all but for the hope that their investigations might substantiate the Hebrew records. For a long time this hope proved illusory, and in the case of Egyptian archaeology the results have proved disappointing even up to the present. Considering the important part played by the Egyptians in our return of the truth as narrated in the Scriptures, it was certainly not an over-enthusiastic prediction that the Egyptian monuments when fully investigated would divulge important references to Joseph, to Moses, and to the all-important incidents of the Exodus; but half a century of expectant attention in this direction has led only to disappointment. It would be rash, considering the buried treasures that may yet await the future explorer, to assert that such records as those in question can never come to light. But, considering the fulness of the contemporary Egyptian records of the XIXth dynasty that are already known, it becomes increasingly doubtful whether the Hebrews in Egypt played so important a part in history, when viewed from the Egyptian standpoint, as their own records had seemed to imply. As the forgotten history of Oriental antiquity has been restored to us, it has come to be understood that, politically speaking, the Hebrews were a relatively insignificant people, whose chief importance from the standpoint of material history was derived from the geographical accident that made them a sort of buffer between the greater nations about them. Only once, and for a brief period, in the reigns of David and Solomon did the Hebrews rise to anything like an equal plane of political importance with their immediate neighbours. What gave them a seeming importance in the eyes of posterity was the fact that the true history of the Egyptians, Mesopotamians, Arabs and Hitites had been well-nigh forgotten. The various literatures of these nations were locked from view for more than two thousand years, while the literature of Israel had not merely been preserved, but had come to be regarded as inspired and sacred among all the cultivated nations of the Western world.

Now that the lost literatures have been restored to us, the status of the Hebrew writings could not fail to be disturbed. Their very isolation had in some measure accounted for their seeming importance; the history they had given us was one of the few that could be submitted to a critical examination. An all true historical perspective is based upon comparison, and where only a single account has been preserved of any event or of any period of history, it is extremely difficult to judge that account with historical accuracy. An illustration of this truth is furnished in profane history by the account which Thucydides has given us of the Peloponnesian War. For most of the period in question Thucydides is the only source; and despite the inherent merit of a great writer, it can hardly be doubted that the tribute of almost unqualified praise that successive generations of scholars have paid to Thucydides must have been in some measure qualified if, for example, a Spartan account of the Peloponnesian War had been preserved to us. Professor Mahaffy has pointed out that many other events in Greek history are viewed by us in somewhat perverted perspective because the great writers of Greece were Athenians rather than Spartans or Thebans. Even in so important a matter as the great conflict between Persia and Greece it has been suggested more than once that we should be able to gain a much truer view were Persian as well as Greek accounts preserved to us.

Not many years ago it would have been accounted a heresy to suggest that the historical books of the Old Testament had conveyed to our minds estimates of Oriental history that differed from this same effect; but to-day no one who is competent to speak with authority pretends to doubt that such is really the fact. Even conservative students of the Bible urge that its historical passages must be viewed precisely in the light of any other historical writings of antiquity; and the fact that the oldest Hebrew manuscript dates only from the 8th century A.D., and therefore of necessity brings to us the message of antiquity through the fallible medium of many generations of copyists, is far more clearly kept in mind than it formerly was. Every belief of mankind is in the last analysis amenable to reason, and finds its origin in evidence that can appeal to the arbitrament of common sense. This evidence may in certain cases consist chiefly of the fact that generations of our predecessors have taken a certain view regarding a certain question; indeed most of our cherished beliefs have this foundation. But when such is the case, mankind has never failed in the long run to vindicate its rationality by showing a readiness to give up the old belief whenever tangible evidence of error is forthcoming. The case of the historical books of the Old Testament furnishes no exception. These had been sacred to almost a hundred generations of men, and it was difficult for the eye of faith to see them as other than absolutely infallible documents. Yet the very eagerness with which these champions of the Hebrew records searched for archaeological proofs of their validity was a tacit confession that even the most unwavering faith was not beyond the reach of external evidence. True, the believer sought corroboration with full faith that he would find it; but the very
fact that he could think such external corroboration valuable implied, however little he may have realized it, the subconscious concession that he must accept external evidence at its full value, even should it prove contradictory. If, then, an Egyptian inscription of the XIXth dynasty had come to hand in which the names of Joseph and Moses, and the deeds of the Israelites as a subject people who finally escaped from bondage by crossing the Red Sea, were recorded in hieroglyphic characters, such a monument would have been hailed with enthusiastic delight by every champion of the Pentateuch, and a wave of supreme satisfaction would have passed over all Christendom. It is not too much, then, to say that failure to find such a monument has caused deep disappointment to Bible scholars everywhere. It does not follow that faith in the Bible record is shaken, although in some quarters there has been a pronounced tendency to regard the history of the Egyptian sojourn as mythical; yet it cannot be denied that Egyptian records, corroborating at least some phases of the Bible story, would have been a most welcome addition to our knowledge. Some recent finds have, indeed, seemed to make inferential reference to the Hebrews, and the marvellous collection of letters of the XVIIIth dynasty found at Tel el-Amarna—letters to which we shall refer later—have the utmost importance as pointing at a relationship between the Hebrews and the Egyptians. But such inferences as these are but a vague return for the labour expended, and an almost cruelly inadequate response to seemingly well-founded expectations.

When we turn to the field of Babylonian and Assyrian archaeology, however, the case is very different. Here we have documents in abundance that deal specifically with events more or less referred to in the Bible. The records of kings whose names hitherto were known to us only through Bible references have been found in the ruins of Nineveh and Babylon, and personages hitherto but shadowy now step forth as clearly into the light of history as an Alexander or a Caesar. Moreover, the newly discovered treasures deal with the beliefs of the people as well as with their history proper. The story of the books now spoken of as the “Creation” and “Deluge” tablets of the Assyrians, in the British Museum, which were discovered in the ruins of Nineveh by Layard and by George Smith, has been familiar to every one for a good many years. The acute interest which they excited when George Smith deciphered their contents in 1872 has to some extent subsided, but it was not without reason that they were popularly believed to date from the time of the Old Testament. And it was similarly generally agreed as to their bearing on the corresponding parts of Genesis. The particular tablets in question date only from about the 8th century B.C., but it is agreed among Assyriologists that they are copies of older texts current in Babylonia for many centuries before, and it is obvious that the compilers of Genesis had access to the Babylonian stories. In a word, the Hebrew Genesis shows unequivocal evidence of Babylonian origin, but, in the words of Professor Sayce, it is but “a paraphrase and not a translation.” However disconcerting such a revelation as this would have been to the theologians of an elder day, the Bible scholars of our own generation are able to regard it with entire composure.

From the standpoint of the historian even greater interest attaches to the records of the Assyrian and Babylonian kings when compared with the historical books of the Old Testament. For some centuries the inhabitants of Palestine were subject to periodical attacks from the warlike inhabitants of Mesopotamia, as even the most casual reader of the Bible is aware. When it became known that the accounts of these invasions formed a part of the records preserved in the Assyrian libraries, historian and theologian alike waited with breathless interest for the exact revelations in store; and this time expectation was not disappointed. As, one after another, the various tablets and cylinders and annalistic tablets have been translated, it has become increasingly clear that here are almost inexhaustible sources of knowledge, and that sooner or later it may be possible to check the Hebrew accounts of the most important periods of their history with contemporaneous accounts written from another point of view. It is true that the cases are not very numerous where precisely the same event is described from opposite points of view, but, speaking in general terms rather than of specific incidents, we are already able to subject considerable portions of history to this test. The records of Shalmaneser II., Tiglath-Pileser III., and Sennacherib, kings of Assyria, of Nebuchadrezzar, king of Babylon, and of Cyrus, king of Persia, all contain direct references to Hebrew history. An obelisk of Shalmaneser II. contains explicit reference to the tribute of Jehu of Samaria, and graphically depicts the Hebrew captives. Tiglath-Pileser III., a usurper who came to the throne of Assyria in 745 B.C., and whose earlier name of Pul proved a source of confusion to the later Hebrew writers, left records that have served to clear up the puzzling chronology of a considerable period of the history of Samaria. Most interesting of all, perhaps, are the annals of Sennacherib, the destruction of whose hosts by the angel of God is so strikingly depicted in the Book of Kings. The court historian of Sennacherib naturally does not dwell upon this event, but he does tell of an invasion and conquest of Palestine. The Hebrew account of the death of Sennacherib is corroborated by a Babylonian inscription. Here, however, there is an interesting qualification. The account in the Book of Kings is thus phrased that one might naturally infer from it that Sennacherib was assassinated by his sons immediately after his return from the expedition to Egypt, the Babylonians not being mentioned. As it now appears, the Assyrian king survived that campaign by twenty years. One cannot avoid the suspicion that in this instance the Hebrew chronicler purposely phrased his account to convey the impression that Sennacherib’s tragic end was but the slightly delayed culmination of the punishment inflicted for his attack upon the “chosen people.” On the other hand, the ambiguity may be quite unintentional, for the Hebrew writers were notoriously lacking in the true historical sense, which shows itself in a full appreciation of the value of chronology.

One of the most striking instances of the way in which mistakes of chronology may lead to the perversion of historical records is shown in the Book of Daniel in connexion with the familiar account of the capture of Babylon by Cyrus. Within the past generation records of Cyrus have been brought to light, as well as records of the conquered Babylonian king himself, which show that the Hebrew writers of the later day had a peculiarly befogged impression of a great historical event—their misconception being shared, it may be added, by the Greek historian Herodotus. When, therefore, the King of Babylon made himself illustrious by the capture of Tyre—a mighty nation long before its time to appear, to the consternation of Bible scholars, that the city of Babylon had capitulated to the Persian—or more properly to the Elamite—conqueror without a struggle. It appeared, further, that the king ruling in Babylon at the time of the capitulation was named not Belshazzar, but Nabonidos. This king, as appears from his own records, had a son named Belshazzar, who commanded Babylonian armies in outlying provinces, but who never came to the throne. Nothing could well be more disconcerting than such a revelation as this. It is held, however, that the startling discrepancies are not so difficult to explain as may appear at first sight. The explanation is found, so the Assyriologist assures us, in the fact that both Hebrew and Greek historians, writing at a considerable interval after the events, and apparently lacking authentic sources, confused the peaceful occupation of Babylon by Cyrus with its siege and capture by a successor to that monarch, Darius Hystaspes. As to the confusion of Babylonian names—in which, by the way, the Hebrew and Greek authors do not agree—it is explained that the general, Nabonidos, was assassinated and succeeded, not more directly known in Palestine than his father the king. But the vagueness of the Hebrew knowledge is further shown by the fact that Belshazzar, alleged king, is announced as the son of Nebuchadrezzar (misspelled Nebuchadnezzer in the Hebrew writings), while the three kings that reigned after Nebuchadrezzar, and before Nabonidos usurped the throne, are quite overlooked.

Our present concern with the archaeological evidence thus briefly outlined, and with much more of the kind, may be summed up in the question: What in general terms is the inference to be drawn by the world-historian from the Assyrian records in their bearings upon the Hebrew writings? At first sight this
might seem an extremely difficult question to answer. Indeed, to answer it to the satisfaction of all concerned might well be pronounced impossible. Yet it would seem as if a candid and impartial historian could not well be greatly in doubt in the matter. On the one hand, the general agreement everywhere between the Hebrew accounts and contemporaneous records from Mesopotamia proves beyond cavil that, broadly speaking, the Bible accounts are historically true, and were written by persons who in the main had access to contemporaneous documents. On the other hand, the discrepancies as to details, the confusion as to exact chronology, the manifest prejudice and partisanship, and the obvious limitations of knowledge make it clear that the writers partook in full measure of the shortcomings of other historians, and that their work must be adjudged by ordinary historical standards. As much as this is perhaps conceded by most, if not all, schools of Biblical criticism of to-day. Professor Sayce, one of the most distinguished of modern Assyriologists, writing as an opponent of the purely destructive "Higher Criticism," demands no more than that the Book of Genesis "shall take rank by the side of the other monuments of the past as the record of events which have actually happened and been handed on by credible men"; that it shall, in short, be admitted to be "a collection of ancient documents which have all the value of contemporaneous testimony," but which being in themselves "wrecks of vast literatures which extended over the Oriental world from a remote epoch," cannot be understood aright "except in the light of the contemporaneous literature of which they form a portion." From the point of view implied by such words as these, it is only necessary to recall the mental attitude of our grandfathers to appreciate in some measure the revolution in thought that has been wrought in this field within the last half-century, largely through the instrumentality of Oriental archaeology.

We have seen that the general trend of Oriental archaeology has been reconstructive rather than iconoclastic. Equally true is it of modern classical archaeology. Here no such revolution has been effected as that which virtually created anew the history of Oriental antiquity; yet the bearings of the new knowledge are similar in kind if different in degree. The world had never quite forgotten the history of the primitive Greeks as it had forgotten the Mesopotamians, the Hymaritic nations and the Hittites; but it remembered their deeds only in the form of poetical myths and traditions. These traditions, finding their clearest delineation in the lines of Homer, had been subjected to the analysis of the critical historians of the early decades of the 19th century, and their authenticity had come to be more than doubted. The philological analysis of Wolf and his successors had raised doubts as to the very existence of Homer, and at one time the main current of scholarly opinion had set strongly in the direction of the belief that the Iliad and the Odyssey were in reality but latter-day collections of divers recitals that had been handed down by word of mouth from one generation to another of bard or minstrel. It was strenuously contended that the case could not well be otherwise, inasmuch as the art of writing had must have been quite unknown in Greece until after the alleged age of the traditional Homer, whose date had been variously estimated at from 1000 to 800 B.C. by less sceptical generations. It had come to be a current belief that the Iliad was first committed to writing in the age of Peisistratus. A prominent controversialist, F. A. Paley, even went so far as to doubt whether a single written copy of the Iliad existed in Greece at the time of the Peloponnesian War. The doubts thus cast upon the age when the Homeric poems first assumed the fixed form of writing were closely associated with the universal scepticism as to the historical accuracy of any traditions whatever regarding the early history of Greece. Cautious historians had come to regard the so-called "Heroic Age" as a prehistoric period regarding which nothing definite was known, or in all probability could be known. It was ably argued by Sir George Cornwell Lewis, in connection with his inquiries into early Roman history, that a verbal tradition is not transmitted from one generation to another in anything like an authentic form for a longer period than about a century. If, then, the art of writing was unknown in Greece before, let us say, the 6th century B.C., it would be useless to expect that any events of Grecian history prior to about the 7th century B.C. could have been transmitted to posterity with any degree of historical accuracy.

Notwithstanding the allusions of the subject, such conservative historians as Grote were disposed to regard the problems of early Grecian history as inscrutable, and to content themselves with the recital of traditions without attempting to establish their relationship with actual facts. It remained for the more robust faith of a Schliemann to show that such scepticism was all too faint-hearted, by proving that at such sites as Tiryns, Mycenae and Hissarlik evidences of a very early period of Greek civilization awaited the spade of the excavator. Thanks to the enthusiasm of Schliemann and his successors, we can now substitute for the mythical "Age of Heroes" a historical "Mycenaean Age" of Greece, and give tangible proof of its relatively high state of civilization. Schliemann may or may not have been correct in identifying one of the seven cities that be unearthed at Hissarlik as the fabled Troy itself, but at least his efforts sufficed to give verisimilitude to the Homeric story. With the lessons of recent Oriental archaeological in mind, few will be sceptical enough to doubt that some such contest as that described in the Iliad actually occurred. And now, thanks to the efforts of a large company of workers, notably Dr Arthur Evans and his associates in Cretan exploration, we are coming to speak with some confidence not merely of a Mycenaean but of a pre-Mycenaean Age.

As yet we see these periods somewhat darkly. The illuminative witness of written records is in the main denied us here. Some most archaic inscriptions have been indeed found by the explorers in Crete, but these for the present serve scarcely any other purpose than to prove the antiquity of the art of writing among a people who were closely in touch with the inhabitants of Hellas proper. Most unfortunately for posterity, the Greeks wrote mainly upon perishable materials, and hence the chief records even of their later civilization have vanished. The only fragments of Greek manuscripts antedating the Christian era that have been preserved to us have been found in Egypt, where a hospitable climate granted them a term of existence not to be hoped for elsewhere. No fragment of these papyri, indeed, carries us further back than the age of the Ptolemies; but the Greek inscriptions on the statues of Rameses II. at Abu-Simbel, in Nubia, give conclusive proof that the art of writing was widely disseminated among the Greeks at least three centuries before the age of Alexander. This carries us back towards the traditional age of Homer.

The Cretan inscriptions belong to a far older epoch, and are written in two non-Grecian scripts of undetermined affinities. Here, then, is direct evidence that the Aegean peoples of the Mycenaean Age knew how to write, and it is no longer necessary to assume that the verses of the Iliad were dependent on verbal transmission for any such period as has been supposed. But even were direct evidence of the knowledge of the art of writing in Greece of the early day altogether lacking, none but the hardiest sceptic could doubt, in the light of recent archaeological discoveries elsewhere, that the inhabitants of ancient Hellas of the "Homerie Age" must have shared with their contemporaries the capacity to record their thought in written words. We have seen that Oriental archaeology has in recent generations revolutionized our conceptions of the antiquity of civilization. We have seen that written documents have been preserved in Mesopotamia to which such a date as 4500 B.C. may be ascribed with a good deal of confidence; and that from the third millennium B.C. a flood of contemporary literary records comes to us both from Egypt and Mesopotamia. But until recently it had been supposed that Hellas was shut out entirely from this Oriental culture. Historians have found it hard to dispel the idea that civilization in Greece was a very late development, and that the culture of the age of Solon sprang, in fact, suddenly into existence, as it seems to do in the records of the
chronology

Historian. But the excavations that have given us a knowledge of the Mycenaean Age have proved conclusively, not alone that civilization existed in Greece in an early day, but that this civilization was closely linked with the civilization of Egypt. Not only have antiquities been found in Crete that point to Egyptian inspiration, but quite recently Professor Petrie has found at Tel-el-Amarna Mycenaean pottery. The latter find has a peculiar significance, since the date of the Tel el-Amarna collection is definitely fixed between the years 1400 and 1370 B.C.

It is demonstrated, then, that as early as the beginning of the 14th century B.C. the Mycenaean civilization was in touch with the ancient civilization of Egypt. One must not infer from this, however, that the two civilizations met on anything like an equality. Indeed, in the wonderful Tel-el-Amarna collection there is a suggestive absence of literary documents from the Aegean that demands a word of notice. The Tel el-Amarna collection, it will be recalled, consists of the royal archives of King Amenophis IV. of the XVIIIth Egyptian dynasty, who in the latter years of his reign chose to be known as Akhenaton, "the glory of the solar disk." This monarch had retired from Thebes and established his court on the site now known as Tell ed-Daba, who founded the city which existed only during the brief period of those years ending with the death of the monarch about 1370 B.C. The date of the documents found in the royal library is, therefore, fixed within very narrow limits. The documents in question consist chiefly of letters, and constitute one of the most important of archaeological finds. These letters came to the king from almost every part of western Asia, including Palestine and Phoenicia, Babylonia and Asia Minor. Strangely enough, all the letters are written in the Babylonian character, and most of them are in the Babylonian language. They afford, therefore, most striking evidence of a widespread diffusion of Babylonian culture. Incidentally they prove, to the utter confusion of a certain school of Bible critics, that the art of writing was familiarly known in Canaan, and that Egypt and western Asia were in full literary connexion with one another, long before the time of the Exodus. Hence all the elaborate arguments based on the supposition that Moses probably could not write fall to the ground. On the other hand, the absence of letters from Mycenaean among the tablets of Tel el-Amarna must be regarded as at least suggestive. Some ten poems, ten hymns, ten prayers had reached the Aegean peoples; yet those peoples cannot have been wholly ignorant of things with which commercial intercourse brought them in contact. The point is of no very great significance, however, since no one has pretended that the Western civilization compared with the Eastern in point of antiquity; and in any event, no amount of negative evidence weighs a grain in the balance against the positive evidence of the Cretan inscriptions.

The researches of the archaeologist are, in short, tending to reconstruct the primitive classical history; and here, as in the Orient, it is evident that historians of the earlier day were constantly blinded by a misconception as to the antiquity of civilization. Such a fruitage as that of Greek culture of the age of Pericles does not come to maturity without a long period of preparation. Here, as elsewhere, the laws of evolution hold, permitting no sudden stupendous leaps. But it required the arduous labours of the archaeologist to prove a proposition that, once proven, seems self-evident.

(H. S. Wl.)

eras and periods

In the article Calendar (q.v.), that part of chronology is treated which relates to the measurement of time, and the principal methods are explained that have been employed, or are still in use, for adjusting the lunar months of the solar year, as well as the intercalations necessary for regulating the civil year according to the celestial motions. But it is necessary to notice here the different Eras and Periods that have been employed by historians, and by the different nations of the world, in recording the succession of time and events, to fix the epochs at which the eras respectively commenced, to ascertain the form and the initial day of the year made use of, and to establish their correspondence with the years of the Christian era. These elements will enable us to convert, by a simple arithmetical operation, any historical date, of which the chronological characters are given, according to any era whatever, into the corresponding one in the Christian era.

Julian period.—Although the Julian period (the invention of Joseph Scaliger, in 1582) is not, properly speaking, a chronological era, yet, on account of its affording considerable facilities in the comparison of different eras with one another, and in marking without ambiguity the years before Christ, it is very generally employed by chronologists. It consists of 7508 Julian years; and the first year of the Christian era corresponded with the year 4714 of the Julian period.

Olympiads.—The Olympic games, so famous in Greek history, were celebrated once every four years, between the new and full moon first following the summer solstice, on the small plain named Olympia in Elis, which was bounded on one side by the river Alpheus, on another, by the small tributary stream the Cladeus, and on the other two sides by mountains. The games lasted five days. Their origin, lost in the dimness of remote antiquity, was invested by priests and legends with a sacred character. They were said to have been instituted by the Idaean Heracles, to commemorate his victory over four brothers in a four months' contest, with a law that they should be re-established by Iphitus, king of Elis, in concert with the Spartan Lycurgus and Cleothennes of Pisa. The practice was long afterwards adopted of designating the Olympiad, or period of four years, by the name of the victor in the contest of the stadium, and of inscribing his name in the gymnasium of Olympia. The first who received this honor was Coroebus. The games in which Coroebus was victor, and which form the principal epoch of Greek history, were celebrated about the time of the summer solstice 776 years before the common era of the Incarnation, in the 3938th year of the Julian period, and twenty-three years, according to the account of Varro, before the foundation of Rome.

Before the introduction of the Metonic cycle, the Olympic year began sometimes with the full moon which followed, at other times with that which preceded the summer solstice, because the year sometimes contained 384 days instead of 354. But subsequently to its adoption, the year always commenced with the eleventh day of the moon which followed the solstice. In the following year, if the intercalation had been necessary, it would have been repeated in the next year, and of which the results differ only by a few days, chronologists generally regard the 1st of July as the commencement of the Olympic year. Some authors, however, among whom are Eusebius, Jerome and the historian Socrates, place its commencement at the 1st of September; these, however, appear to have confounded the Olympic year with the civil year of the Greeks, or the era of the Seleucidae.

It is material to observe, that as the Olympic years and periods begin with the 1st of July, the first six months of a year of our era correspond to one Olympic year, and the last six months to another. Thus, if it is said that the first year of the Incarnation corresponds to the first of the 19th Olympiad, we are to understand that it is only with respect to the last six months of that year that the correspondence takes place. The first six months belonged to the fourth year of the 19th Olympiad. In referring dates expressed by Olympiads to our era, or the contrary, we must therefore distinguish two cases.

1st. When the event in question happened between the 1st of January and the 1st of the following July, the sum of the Olympic years and the year before Christ is always equal to 776. The year of the era, therefore, will be found by subtracting the number of the Olympic year from 776. For example, Varro refers the foundation of Rome to the 21st of April of the third year of the sixth Olympiad; and it is required to find the year before our era. Since five Olympic periods have elapsed, the third year of the sixth Olympiad is 5X+3=23; therefore, subtracting 23 from 776, we have 753, which is the year before Christ to which the foundation of Rome is referred by Olympiads to our era.

2nd. When the event took place between the summer solstice and the 1st of January following, the sum of the Olympic years and the year before Christ is equal to 777. The difference, therefore, between 777 and the year in one of the dates will give the year in the other date. Thus, the moon was eclipsed on the 27th of August, a little before midnight, in the year 413 before our era; and it is required...
to find the corresponding year in the Olympic era. Subtract 413 from 777, the remainder is 364; and 364 divided by four gives 91 without a remainder; consequently the eclipse happened in the fourth year of the ninety-first Olympiad, which is the date to which it refers in our era.

If the year is after Christ, and the event took place in one of the first six months of the Olympic year, that is to say, between July and January, we must subtract 776 from the number of the Olympic year, and add to it the number of our era; but if it took place in one of the last six months of the Olympic year, or between January and July, we must deduct 777. The computation by Olympiads seldom occurs in historical records after the middle of the 5th century B.C.

The names of the months were different in the different Grecian states. The Attic months, of which we possess the most certain knowledge, were named as follows:—

Era of the Foundation of Rome.—After the Olympiads, the era most frequently met with in ancient history is that of the foundation of Rome, which is the chronological epoch adopted by all the Roman historians. There are various opinions respecting the year of the foundation of Rome. (1) Fabius Pictor places it in the latter half of the first year of the eighth Olympiad, which corresponds with the 396th of the Julian period, and with the year 747 B.C. (2) Polybius places it in the second year of the seventh Olympiad, corresponding with 3964 of the Julian period, and 730 B.C. (3) M. Porcius Cato places it in the first year of the seventh Olympiad, that is, in 3963 of the Julian period, and 731 B.C. (4) Verrius Flaccus places it in the fourth year of the sixth Olympiad, that is, in the year 3962 of the Julian period, and 732 B.C. (5) Titianus Varro places it in the third year of the sixth Olympiad, that is, in the year 3961 of the Julian period, and 733 B.C. There is a knowledge of these different opinions, and it is necessary, in order to reconcile the Roman historians with one another, and even any one writer with himself, to live in general adherence to the epoch of Cato, though he sometimes follows that of Fabius Pictor. Cicero follows the account of Varro, which is also in general adopted by Pliny. Dionysius of Halicarnassus follows Cato. Modern chronologers for the most part adopt the account of Varro, which is supported by a passage in Censorinus, where it is stated that the 991st year of Rome commenced with the festival of the Palilia, in the consulship of Ulpius and Postuanus. Now this consulate corresponded with the 238th year of our era; therefore, deducting 233 from 991, we have 758 to denote the year before Christ. The Palilia commenced on the 21st of April; and all the accounts agree in regarding that day as the epoch of the foundation of Rome.

The Romans employed two sorts of years, the civil year, which was employed in all matters of private, or civil, concern, and the consular year, according to which the annals of their history have been compiled. The civil year commenced with the calends of January, but this did not hold a fixed place in the solar year till the time of Julius Caesar (see Calendar). The installation of the consuls regulated the commencement of the consular year. The initial day of the consulate was never fixed, at least before the 7th century of Rome, but varied with the different accidents which in times of political commotion were so frequently occurred to accelerate or retard the elections. Hence it happens that a consular year, as we are speaking, comprehends a part not only of two Julian years, but also of two civil years. The consulate is the date employed by the Latin historians, generally, and by many of the Greeks, down to the 6th century of our era.

In the era of Rome the commencement of the year is placed at the 21st of April: an event therefore which happened in the months of January, February, March, or during the first twenty days of April, in the year (as Pliny) which belongs to the year 501. Before the time of the Decemvirs, however, February was the last month of the year. Many authors confound the year of Rome with the civil year, supposed them both to begin on the 1st of January. Others confound both the year of Rome and the civil year with the Julian year, which in fact became the civil year after the regulation of the calendar by Julius Caesar. Through a like want of attention, many writers also, particularly among the moderns, have confounded the Julian and Olympic years, by and by an entire Julian year correspond to an entire Olympic year, as if both had commenced at the same epoch. Much attention to these particulars is required in the comparison of ancient dates.

The Christian Era.—The Christian or vulgar era, called also the era of the Incarnation, is now almost universally employed in Christian countries, and is even used by some Eastern nations. Its epoch or beginning is the 1st of January in the fourth year of the 104th Olympiad, the 753rd from the foundation of Rome, and the 4714th of the Julian period. This epoch was introduced in Italy in the 6th century, by Dionysius the Little, a Roman abbot, and began to be used in Gaul in the 8th, though it was not generally followed in that country till a century later. From extant charts it is known to have been in use in England before the close of the 8th century. Before its adoption the usual practice in Latin countries was to distinguish the years by their number in the cycle of Indiction.

In the Christian era the years are simply distinguished by the cardinal numbers; those before Christ being marked b.C. (Before Christ), or a.C. (Ante Christum), and those after Christ a.D. (Anno Domini). This method of reckoning time is more convenient than those which employ cycles or periods of any length whatever; but it still fails to satisfy in the simplest manner possible all the conditions that are necessary for registering the succession of events. For, since the commencement of the era is not determined with an entire century, at an antedate period of history, we are compelled to resort to a double method of reckoning, both backward as well as forward. Some ambiguity is also occasioned by the want of uniformity in the method of numbering the preceding years. Astronomers denote the year which preceded the first of our era by 0, and the year previous to that by 1 a.C.; but chronologers, in conformity with common notions, call the year preceding the era 1 b.C., the previous year 2 b.C., and so on. By reckoning in this manner, there is an interruption in the regular succession of the numbers; and in the years preceding the era, the leap years, instead of falling on the fourth, eighth, twelfth, &c., fall, or ought to fall, on the first, fifth, ninth, &c.

In the chronicles of the middle ages much uncertainty frequently arises respecting dates on account of the different epochs assumed for the beginning of the Christian year. Dionysius, the author of the era, adopted the day of the Annunciation, or the 25th of March, which preceded the birth of Christ by nine months, as the commencement of the first year of the era. This epoch therefore precedes that of the vulgar era by nine months and seven days. The former mode of dating was followed in some of the Italian states, and continued to be used in Pisa even down to the year 1745. It was also adopted in some of the Papal bulls; and there are proofs of its having been employed in France about the middle of the 11th century. Some chroniclers, who adhere to the day of the Annunciation as the commencement of the year, reckon from the 25th of March following our epoch, as the Florentines in the 10th century. Gregory of Tours, and some writers of the 6th and 7th centuries, make the year begin sometimes with the 1st of March, and sometimes with the 1st of January. In France, under the third race of kings, it was usual to begin the year with Easter; and this practice continued at least till the middle of the 16th century, for an edict was issued by Charles IX. in the month of January 1603, ordaining that the beginning of the year should thenceforth be considered as taking place on the 1st of January. An instance is given, in L'Art de vérifier les dates, of a date in which the year is reckoned from the 18th of March; but it is probable that this refers to the Orthodox Christian year, and that the 18th of March was taken for the day of the vernal equinox. In Germany, about the 11th century, it was usual to begin the year at Christmas; and this practice also prevailed at Milan, Rome and other Italian cities. In the 13th, 14th and 15th centuries.

In England, the practice of placing the beginning of the year at Christmas was introduced in the 7th century, and traces of it are found even in the 13th. Gervase of Canterbury, who lived in the 13th century, mentions that almost all writers of his country agreed in regarding Christmas day as the first of the year, because it forms, as it were, the term at which the sun finishes and recommences his annual course. In the 12th century, however, the custom of beginning the civil year with the day of the Annunciation, or the 25th of March, began to prevail, and
continued to be generally followed from that time till the reform of the calendar in 1552. The historical year has always been reckoned by English authors to begin with the 1st of January. The liturgic year of the Church of England commences with the first Sunday of Advent.

A knowledge of the different epochs which have been chosen for the commencement of the year in different countries is indispensably necessary to the right interpretation of ancient chronicles, charters and other documents in which the dates often appear contradictory. We may cite an example or two. It is well known that Charles the Great was crowned emperor at Rome on Christmas day in the year 800, and that he died in the year 814, according to our present manner of reckoning. But in the annals of Metz and Moissac, the coronation is stated to have taken place in the year 801, and his death in 813. In the first case the annalist supposes the year to begin with Christmas, and accordingly reckons the 25th of December and all the following days of that month to belong to 801, whereas in the common reckoning they would be referred to the year 800. In the second case the year has been supposed to begin with the 25th of March, or perhaps with Easter; consequently the first three months of the year 814, reckoning from the 1st of January, would be referred to the end of the year 813. The English Revolution is the so-called era of the creation of 1688. Had the latter begun, as it now does, with the 1st of January, it would have been the revolution of 1689, William and Mary being received as king and queen in February in the year 1689; but at that time the year was considered in England as beginning on the 25th of March. Another circumstance to which it is often necessary to pay attention in the comparison of dates, is the alteration of style which took place on the adoption of the Gregorian Calendar (see Calendar).

Era of the Creation of the World.—As the Greek and Roman methods of computing time were connected with certain pagan rites and observances which the Christians held in abhorrence, the latter began an early period to imitate the Jews in reckoning their years from the supposed period of the creation of the world. Various computations were made at different times, from Biblical sources, as to the age of the world; and Des Vignoles, in the preface to his Chronology of Sacred History, asserts that he collected upwards of two hundred different calculations, the shortest of which reckons only 3493 years between the creation of the world and the commencement of the vulgar era and the long or ecclesiastical era. The creation of 1688, therefore, is a purely conventional and arbitrary epoch; practically, it means the year 4004 B.C.,—this being the date which, under the sanction of Archbishop Usher's opinion, won its way, among the hundreds of competitors, into general acceptance.

Jewish Year and Eras.—Before the departure of the Israelites from Egypt their year commenced at the autumnal equinox; but in order to solemnise the memory of their deliverance, the month of Nisan or Abib, in which that event took place, and which falls about the time of the vernal equinox, was afterwards regarded as the beginning of the ecclesiastical or legal year. In civil affairs, and in the regulation of the jubilees and sabbatical years, the Jews still adhere to the ancient year, which begins with the month Tisri, about the time of the autumnal equinox.

After their dispersion the Jews were constrained to have recourse to the astronomical rules and cycles of the more enlightened heathen, in order that their religious festivals might be observed on the same days in all the countries through which they were scattered. For this purpose they adopted a cycle of eighty-four years, which is mentioned by several of the ancient fathers of the church, and which the early Christians borrowed from them for the regulation of Easter. This cycle seems to be neither more nor less than the Calippic period of seventy-six years, with the addition of a Greek octaëteris, or period of eight years, in order to disguise its true source, and give it an appearance of originality. In fact, the period of Calippus containing 27,759 days, and the octaëteris 2022 days, the sum, which is 30,681, is exactly the number of days in eighty-four Julian years. But the addition was very far from being an improvement on the work of Calippus; for instead of a difference of only five hours and fifty-three minutes between the places of the sun and moon, which was the whole error of the Calippic period, this difference, in the period of eighty-four years, amounted to one day, six hours, and forty-one minutes. Buccherus places the beginning of this cycle in the year 162 B.C.; Prideaux in the year 291 B.C. According to the account of Prideaux, the fifth cycle must have begun in the year 46 of our era; and it was in this year, according to St Prosperus, that the Christians began to employ the Jewish cycle of eighty-four years, which they followed, though not uniformly, for the regulation of Easter, till the time of the Council of Nice. Soon after the Nicene council, the Jews, in imitation of the Christians, abandoned the cycle of eighty-four years, and adopted that of Meton, by which their lunisolar year is regulated at the present day. This improvement was first proposed by Rabbi Samuel, rector of the Jewish school of Sora in Mesopotamia, and was finally accomplished in the year 300 of our era by Rabbi Hillel, who introduced that form of the year which the Jews at present follow, and which, they say, is to endure till the coming of the Messiah.

Era of Constantinople.—This era, which is still used in the Greek Church, and was followed by the Russians till the time of Peter the Great, dates from the creation of the world. The Incarnation falls in the year 5509, and corresponds, as in our era, with the fourth year of the 194th Olympiad. The civil year commences with the 1st of September; the ecclesiastical year sometimes with the 21st of March, sometimes with the 1st of April. It is not certain whether the year was considered at Constantinople as beginning with September before the separation of the Eastern and Western empires.

At the commencement of our era there had elapsed 5506 years and four months of the era of Constantinople. Hence the first eight months of the Christian year 1 coincide with the Constantinopolitan year 5509, while the last four months belong to the year 5510. In order, therefore, to find the year of Christ corresponding according to our computation, place 3560 years and about three months between the beginning of our era and the 1st of January and the end of August subtract 5508 from the given year; but if it happened between the 1st of September and the end of the year, subtract 5509.

Era of Alexandria.—The chronological computation of Julius Africanus was adopted by the Christians of Alexandria, who accordingly reckoned 5500 years from the creation of Adam to the birth of Christ. But in reducing Alexandrian dates to the common era it must be observed that Julius Africanus placed the epoch of the Incarnation three years earlier than it is placed in the usual reckoning, so that the initial day of the Christian era fell in the year 5503 of the Alexandrian era. This correspondence, however, continued only from the introduction of the era till the accession of Diocletian, when an alteration was made by dropping ten years in the Alexandrian account. Diocletian ascended the imperial throne in the year of Christ 284. According to the Alexandrian computation, this was the year 5787 of the world, and 285 of the Incarnation; but on this occasion ten years were omitted, and that year was thenceforth called the year 5777 of the world, and 277 of the Incarnation. There are, consequently, two distinct eras of Alexandria, the one being used before and the other after the accession of Diocletian. It is not known for what reason the alteration was made; but it is conjectured that it was for the purpose of causing a new revolution of the cycle of nineteen years (which was introduced into the ecclesiastical computation about this time by Anatolius, bishop of Hierapolis) to begin with the first year of the reign of Diocletian. In fact, 5777 being divided by 19 leaves 1 for the year of the cycle. The Alexandrian
era continued to be followed by the Copts in the 15th century, and is said to be still used in Abyssinia.

Dates expressed according to this era are reduced to the common era by subtracting 5502, up to the Alexandrian year 5786 inclusive, and after that year by subtracting 5492; but if the date belongs to one of the four last months of the Christian year, we must subtract 5503 till the year 5786, and 5493 after that year.

Mundane Era of Antioch.—The chronological reckoning of Julius Africanus formed also the basis of the era of Antioch, which was adopted by the Christians of Syria, at the instance of Panodorus, an Egyptian monk, who flourished about the beginning of the 4th century. Panodorus struck off ten years from the account of Julius Africanus with regard to the years of the world, and he placed the Incarnation three years later, referring to it as the fourth year of the 194th Olympiad, as in the common era. Hence the era of Antioch differed from the original era of Alexandria by ten years; but after the alteration of the latter at the accession of Dioscurian, the two eras coincided. In reckoning from the Incarnation, however, there is a difference of seven years, that epoch being placed, in the reformed era of Antioch, seven years later than in the mundane era of Antioch or in the Christian era.

As the Syrian year began in autumn, the year of Christ corresponding to any year in the mundane era of Antioch is found by subtracting 5490 or 5493 according as the event falls between January and September or from September to January.

Era of Nabonassar.—This era is famous in astronomy, having been generally followed by Hipparchus and Ptolemy. It is believed to have been in use from the very time of its origin; for the observations of eclipses which were collected in Chaldæa by Callisthenes, the general of Alexander, and transmitted by him to Aristotle, were for the greater part referred to the beginning of the reign of Nabonassar, founder of the kingdom of the Babylonians. It is the basis of the famous Canon of kings, also called Mathematical Canon, preserved to us in the works of Ptolemy, which, before the astonishing discoveries at Nineveh, was the sole authentic monument of Assyrian and Babylonian history known to us. The epoch from which it is reckoned is precisely determined by numerous celestial phenomena recorded by Ptolemy, and corresponds to Wednesday at mid-day, the 26th of February of the year 747 before Christ. The year was in all respects the same as the ancient Egyptian year. On account of the difference in the length of the Julian and Babylonian years, the conversion of dates according to the era of Nabonassar into years before Christ is attended with considerable trouble. The surest way is to follow a comparative table. Frequently the year cannot be fixed with certainty, unless we know also the month and the day.

The Greeks of Alexandria formerly employed the era of Nabonassar, with a year of 365 days; but soon after the reformation of the calendar of Julius Caesar, they adopted, like other Roman provincials, the Julian intercalation. At this time the first of Thoth had receded to the 29th of August. In the year 136 of our era, the first of Thoth in the ancient Egyptian year corresponds with the 30th of July, between which and the 20th of August there are forty days. The adoption of the Julian year must therefore have taken place about 160 years before the year 136 of our era (the difference between the Egyptian and Julian years being one day in four years), that is to say, about the year 25 B.C. In fact, the first of Thoth corresponded with the 29th of August in the Julian calendar, in the years 25, 24, 23 and 22 B.C.

Era of the Seleucidae, or Macedonian Era.—The era of the Seleucidae dates from the time of the occupation of Babylon by Seleucus Nicator, 311 years before Christ, in the year of Rome 442, and twelve years after the death of Alexander the Great. It was adopted not only in the monarchy of the Seleucidae but in general in all the Greek countries bordering on the Levant, was followed by the Jews till the 15th century, and is said to be used by some Arabsians even at the present day. By the Jews it was called the Era of Contracts, because the Syrian governors compelled them to make use of it in civil contracts; the writers of the books of Maccabees call it the Era of Kings. But notwithstanding its general prevalence in the East for many centuries, authors using it differ much with regard to their manner of expressing dates, in consequence of the different epochs adopted for the beginning of the year. Among the Syrian Greeks the year began with the month Elul, which corresponds to our September. The Nestorians and Jacobites at the present day suppose it to begin with the following month, or October. The author of the first book of Maccabees makes the era commence with the month Nisan, or April; and the author of the second book with the first Tishrin, or October. Albageni, a celebrated Arabian astronomer, dates from the 1st of October. Some of the Arabian writers, as Allergani, date from the 1st of September. At Tyre the year was counted from the 10th of our October, at Gaza from the 28th of the same month, and at Damascus from the vernal equinox. These discrepancies render it extremely difficult to determine the exact correspondence of Macedonian dates with those of other eras; and the difficulty is rendered still greater by the want of uniformity in respect of the length of the year. Some authors who follow the Macedonian era, use the Egyptian or vague year of 365 days; Albategni adopts the Julian year of 365½ days.

According to the computation most generally followed, the year 312 of the era of the Seleucidae began on the 1st of September in the Julian year preceding the first of our era. Hence, to reduce a Macedonian date to the common era, subtract 311 years and four months.

The names of the Syrian and Macedonian months, and their correspondence with the Roman months, are as follows:

Era of Alexander.—Some of the Greek historians have assumed as a chronological epoch the death of Alexander the Great, in the year 325 B.C. The form of the year is the same as in the preceding era. This era has not been much followed; but it requires to be noticed in order that it may not be confounded with the era of the Seleucidae.

Era of Tyre.—The era of Tyre is reckoned from the 10th of October, or the beginning of the Macedonian month Hyperberaetes, in the year 126 B.C. In order, therefore, to reduce it to the common era, subtract 125; and when the date is B.C., subtract it from 126. Dates expressed according to this era occur only on a few medals, and in the acts of certain councils.

Caesarean Era of Antioch.—This era was established to commemorate the victory obtained by Julius Caesar on Pharsalia, on the 9th of August in the year 49 B.C., and the 70th of Rome. The Syrians computed it from their month Tishrin I.; but the Greeks threw it back to the month Gorpilus of the preceding year. Hence there is a difference of eleven months between the epochs assumed by the Syrians and the Greeks. According to the computation of the Greeks, the 49th year of the Caesarean era began in the autumn of the year preceding the commencement of the Christian era; and, according to the Syrians, the 49th year began in the autumn of the first year of the Incarnation. It is followed by Evagrius in his Ecclesiastical History.

Julian Era.—The Julian era begins with the 1st of January, forty-five years B.C. It was designed to commemorate the reformation of the Roman calendar by Julius Caesar.

Era of Spain, or of the Caesars.—The conquest of Spain by Augustus, which was completed in the thirty-ninth year B.C., gave rise to this era, which began with the first day of the following...
The following are the names of the Ethiopian or Abyssinian months, with the days on which they begin in the Julian calendar, or old style:

- **Maccaram**: 29th August.  Magabit 25th February.
- **Tikmith**: 28th September.  Miazir 27th March.
- **Kfar**: 28th October.  Ginwot 27th April.
- **Tacsam**: 27th November.  Sene 26th May.
- **Tir**: 27th December.  Hamle 25th June.
- **Yacatt**: 26th January.  Nahase 25th July.

The additional or epagominal days begin on the 24th of August. In intercalary years the first seven months commence one day later. These intercalary months followed by the modern Copts, agree with the above in every respect excepting the names.

**Indiction.**—The cycle of Induction was very generally followed in the Roman empire for some centuries before the adoption of the Christian era. Three Indictions may be distinguished; but they differ only in regard to the commencement of the year.

1. The **Constantinopolitan Indiction**, like the Greek year, commenced with the month of September. This was followed in the Eastern empire, and in some instances also in France.

2. The **Imperial or Constantinian Indiction** is so called because its establishment is attributed to Constantine. This was also called the **Caesarean Indiction**. It begins on the 24th of September. It is not infrequently met with in the ancient chronicles of France and England.

3. The **Roman or Pontifical Indiction** began on the 25th of December or 1st of January, according as the Christian year was held to begin on the one or other of these days. It is often employed in papal bulls, especially after the time of Gregory VII., and traces of its use are found in early French authors.

**Era of the Armenians.**—The epoch of the Armenian era is that of the council of Tiben, in which the Armenians consummated their schism from the Greek Church by condemning the acts of the council of Chalcedon; and it corresponds to Tuesday, the 9th of July of the year 552 of the Incarnation. In their civil affairs the Armenians follow the ancient vague year of the Egyptians; but their ecclesiastical year, which begins on the 11th of August, is regulated in the same manner as the Julian year, every fourth year consisting of 366 days, so that Easter and the other festivals are retained at the same place in the seasons as well as in the civil year. The Armenians also make use of the mundane era of Constantinople, and sometimes conjoin both methods of computation in the same documents. In their correspondence and transactions with Europeans, they generally follow the era of the Incarnation, and adopt the Julian year.

To reduce the civil dates of the Armenians to the Christian era, proceed as follows. Since the epoch is the 9th of July, there were 176 days from the beginning of the Armenian era to the beginning of the year 552 of our era; and since 552 was a leap year, the year 553 began a Julian intercalary period. Multiply, therefore, the number of Armenian years elapsed by 365; add the number of days from the commencement of the current year to the given date; subtract 176 from the sum, and the remainder will be the number of days from the 1st of January 553 to the given date. This number of days being reduced to Julian years, add the result to 552, and the sum gives the day in the Julian year, or old style.

In the ecclesiastical reckoning the year begins on the 11th of August. To reduce a date expressed in this reckoning to the Julian date, add 551 years, and the days elapsed from the 1st of January to the 10th of August, both inclusive, of the year 552—that is to say (since 552 is a leap year), 232 days. In leap years one day must be subtracted if the date falls between the 1st of March and 17th of August.

The following are the Armenian ecclesiastical months with their correspondence with those of the Julian calendar:

1. Navazardi begins 11th August.
2. Hori 10th September.
3. Sahmi 10th October.
4. Dre Thari 9th November.
5. Kagoths 9th December.
6. Arac 8th January.
7. Maleghi 7th February.
To complete the year five complementary days are added in common years, and six in leap years.

The Mahommedan Era, or Era of the Hegira.—The era in use among the Turks, Arabs and other Mahomedan nations is that of the Hegira or Hejra, the flight of the prophet from Mecca to Medina, 622 A.D. Its commencement, however, does not, as is sometimes stated, coincide with the very day of the flight, but is preceded by sixty-eight days. The prophet, after leaving Mecca, to escape the pursuit of his enemies, the Koreishites, hid himself with his friend Abu Bekr in a cave near Mecca, and there lay for three days. The departure from the cave and setting out on the way to Medina is assigned to the ninth day of the third month, Rabia I.—corresponding to the 22nd of September of the year 622 A.D. The era begins from the first day of the month of Muharram preceding the flight, or first day of that Arabian year which coincides with Friday, July 16, 622 A.D. It is necessary to remember that by astronomers and by some historians the era is assigned to the preceding day, July 15. It is stated by D’Herbelot that the era of the Hegira was instituted by Omar, the second caliph, in imitation of the Christian era of the martyrs.

Era of Yazgederd, or Persian or Jalalaean Era.—This era begins with the elevation of Yazgederd III to the throne of Persia, on the 16th of June in the year of our era 632. Till the year 1079 the Persian year resembled that of the ancient Egyptians, consisting of 365 days without intercalation; but at that time the Persian calendar was reformed by Jelal ud-Din Malik Shah, sultan of Khosrowan, and a method of intercalation adopted which, though less convenient, is considerably more accurate than the Julian. The intercalary period is 33 years, one day being added to the common year seven times successively at the end of four years, and the eighth intercalary being deferred till the end of the fifth year. This era was at one period universally adopted in Persia, and it still continues to be followed by the Parsees of India. The months consist of thirty days each, and each day is distinguished by a different name. According to Alfargani, the names of the Persian months are as follows:

The five additional days (in intercalary years six) are named Musteraaca.

As it does not appear that the above-mentioned rule of intercalation was ever regularly followed, it is impossible to assign exactly the days on which the different years begin. In some provinces of India the Parsees begin the year with September, in others they begin it with October. We have stated that the era began with the 16th June 632. But the vague year, which was followed till 1079, anticipated the Julian year by one day every four years. In 447 years the anticipation would amount to about 112 days, and the beginning of the year would in consequence be thrown back to near the beginning of the Julian year 632. To the year of the Persian era, therefore, add 631, and the sum will be the year of our era in which the Persian year begins.

Chinese Chronology.—From the time of the emperor Yao, upwards of 4000 years B.C., the Chinese had two different systems, a civil and a astronomical year, which was regulated by the moon, and an astro-nomical year, which was solar. The civil year consisted in general of twelve months or lunations, but occasionally a thirteenth was added in order to preserve its correspondence with the solar year. Even at that early period the solar or astronomical year consisted of 365⅔ days, like our Julian year; and it was arranged in the same manner, a day being intercalated every fourth year.

According to the missionary Gaubil, the Chinese divided the day into 100 ke, each ke into 100 minutes, and each minute into 60 seconds. This practice continued to prevail till the 17th century, when, at the instance of the Jesuit Schall, president of the tribunal of mathematics, they adopted the European method of dividing the day into twenty-four hours, each hour into sixty minutes, and each minute into sixty seconds. The civil day begins at midnight and ends at the midnight following.

Since the accession of the emperors of the Han dynasty, 206 B.C., the civil year of the Chinese has begun with the first day of that moon in the course of which the sun enters into the sign of the zodiac which corresponds with our sign Pisces. From the same period also they have employed, in the adjustment of their solar and lunar years, a period of nineteen years, twelve of which are common, containing twelve lunations each, and the remaining seven intercalary, containing thirteen lunations. It is not, however, precisely known how they distributed their months of thirty and twenty-nine days, or, as they termed them, great and small moons. This, with other matters appertaining to the calendar, was probably left to be regulated from time to time by the mathematical tribunal.

The Chinese divide the time of a complete revolution of the sun with regard to the solstitial points into twelve equal portions, each corresponding to thirty days, ten hours, thirty minutes. Each of these periods, which is denominated a tski, is subdivided into two equal parts called chung-ki and isee-ki, the chung-ki dividing the first half of the tski, and the isee-ki the second half.

(Though the tsks are thus strictly portions of solar time, yet what is remarkable, though not peculiar to China, they give their name to the lunar months, each month or lunation having the name of the chung-ki or sign at which the sun arrives during that month. As the tski is longer than a synodic revolution of the moon, the sun cannot arrive twice at a chung-ki during the same lunation; and as there are only twelve tski, the year can contain only twenty-four months having different names. It must happen sometimes that in the course of a lunation the sun enters into no new sign; in this case the month is intercalary, and is called by the same name as the preceding month.

For chronological purposes, the Chinese, in common with some other nations of the east of Asia, employ cycles of sixty, by means of which they reckon their days, moons and years. The days are distributed in the calendar into cycles of sixty, in the same manner as ours are distributed into weeks, or cycles of seven. Each day of the cycle has a particular name, and as it is a usual practice, in mentioning dates, to give the name of the day along with that of the moon and the year, this arrangement affords great facilities in verifying the epochs of Chinese chronology. The order of the days in the cycle is never interrupted by any intercalation that may be necessary for adjusting the months or years. The moons of the civil calendar correspond to the order of the sun within the same manner as the intercalary moons are reckoned, for the reason before stated, namely, that during one of these lunations the sun enters into no new sign, there are only twelve regular moons in a year, so that the cycle is renewed every five years. Thus the first moon of the cycle of 19 years is the same as the first moon of the year 615 B.C., the sixth year, reckoned backwards or forwards from that date, as 1866, 1863, 1859, or 1877, 1882, &c., also begins a new lunar cycle of sixty moons. In regard to the years, the arrangement is exactly the same. In Chinese chronology translated into the Tatar dialect by order of the emperor K'ang-hi, who died in 1721, the characters of the cycle begin to appear at the year 2357 B.C. From this it has been inferred
CHRUDIM—CHRYSANTHEMUM

that the Chinese empire was established previous to that epoch; but it is obviously so easy to extend the cycles backwards indefinitely, that the inference can have very little weight. The characters given to that year 2357 B.C. are Ked-shin, which denote the 41st of the cycles, that is, 2357 B.C., or forty years before the reign of Yao. This is the epoch assumed by the authors of L'Art de vérifier les dates. The mathematical tribunal has, however, from time immemorial counted the first date of the chrysanthemum from the eighty-first of Yao, that is, from the year 2277 B.C.

Since the year 163 B.C., the Chinese writers have adopted the practice of dating the year from the accession of the reigning emperor. An accurate account of the history of the chrysanthemum, in the order of his reign, he ordains, for example, that they shall be called Ta-ta. In consequence of this edict, the following year is called the first of Ta-ta, and the succeeding years the second, third, fourth, &c., of Ta-ta, and so on, till it pleases the same emperor or his successor to order a new era. Three years shall be called by some other appellation. The periods thus formed are called by the Chinese Nien-hao. According to this method of dating the years a new era commences with every reign; and the year corresponding to a Chinese date can only be found by referring to a catalogue of the Nien-hao, with their relation to the years of our era.

For Hindu Chronology, see the article under that heading.

BIBLIOGRAPHY.—In addition to the early Greek writings already named, there are the forty books (some fifteen only extant in their entirety) of universal history compiled (about 8 B.C.) by Diodorus Siculus, and arranged in the form of annals; the Pentades of Julius Africanus (about 220-230 A.D.); the treatise of Censorinus entitled De saeculis, written in 238 A.D.; the Chronicle of Eusebius Pamphilus, bishop of Caesarea (about 325 A.D.), distingished as the first book of a purely chronological character which has come down to us; and three important works forming parts of the Theodosian Code, De Samnitibus (443 A.D.), the Chronographia of Georgius Syncellus (800 A.D.), the Chronographia of Johannes Malalas (9th century), and the Chronicon Paschale.

Among works on Chronology, the following, which are arranged in the order of their composition, have an historical interest, as leading up to the epoch of modern research:

1583. De Emendatione Temporum, by Joseph Scaliger, in which were laid the foundations of chronological science.
1627. De Doctrina Temporum, by Petavius (Denis Petau), with its continuation published in 1630, and an abridgment entitled Rationarium Temporum, in 1633-1634.
1650. Annales Vetus et Novum Testamenti, by Archbishop Ussher, whose dates have by some means gained a place in the authorized version of the Bible.
1651. Regia Epiphi Epirologiae Sacrae et Profanae, by Philippe Labbe, of which a French version was also published.
1652. Institutionum Chronologarii libri duo, by Bishop Beveridge.
1687. L'Antiquité des temps rétablie et défendue, by Paul Pezron, with its Défense, 1691.
1720. The Chronology of Ancient Kingdoms amended, by Sir Isaac Newton, remarkable, as an attempt to construct a system on new bases, independent of the Greek chronologists.
1752. De saeculis chronologici de l'historie universelle, by N. Lenglet-Dufresnoy.
1750. The first edition in one vol. 4to of L'Art de vérifier les dates, which in its third edition (1818-1851) appeared in 38 vols. 8vo. 1817. The work was issued at Rome by order of various members of the Benedictine Congregation of Saint-Maur.
1784. A System of Chronology, by Playfair.
1818. Historie der alteren Geschichte, Geographie, und Chronologie, by C. C. Bredow, with his Historische Tabellen.
1821. Tabulae historicae, chronologicae, et geographicae, by Burrard.
1824-1834. Fasti Hellenici, and 1845-1850, Fasti Romani, by H. Fyens Clinton. Epitomes of these elaborate works were published, 1851-1855.
1824-1826. Handbuch der mathematischen und technischen Chronologie, by Christian Ludwig Ideker; and his Lehrbuch der Chronologie, (1831).
1835. The Chronology of History, by Sir Harris Nicolas. 1842. Fasti Temporis Catholici, by Edward Grassewell; and by the same author (1854), Origines Kalendariseae Italicae; and 1862, Origines Kalendariae Helleniaca.

More modern works are the Encyclopaedia of Chronology, by B. B. Woodward and W. L. R. Cates (1872); and J. C. Macdonald's Chronologies and Calendars (1837). But see the separate historical articles in this work.

CHRUDIM, a town of Bohemia, Austria, 74 m. E.S.E. of Prague by rail. Pop. (1900) 13,017, mostly Czech. It has an important horse market, besides manufactures of sugar, spirits, beer, soda-water and agricultural machinery. There are also steam-corn-mills and saw-mills. Chrudim is mentioned as the castle of a gaugraf as early as 903. The new town was founded by Ottokar II., who settled many Germans in it and gave it many privileges. After 1421 Chrudim was held by the Hussites, and though Ferdinand I. confiscated most of the town property, it prospered greatly till the outbreak of the Thirty Years' War. In 1625 a greater part of its Hussite inhabitants left the town, which suffered much later on from the Swedes. Chrudim was the birthplace of Joseph Ressel (1793-1857), honoured in Austria as the inventor of the screw propeller.

CHRYSANTHEMUM¹ (Chrysanthemum sinense; nat. ord. Compositae), one of the most popular of autumn flowers. It is a native of China, whence it was introduced to Europe. The first chrysanthemum in England was grown at Kew in 1790, whether it had been sent by Mr Cels, a French gardener. It was not, however, till 1825 that the first chrysanthemum exhibition took place in England. The small-flowered pomspons, and the grotesque-flowered Japanese sorts, are of comparatively recent date, the former having originated from the Chusan daisy, a variety introduced by Mr Fortune in 1846, and the latter having also been introduced by the same traveller about 1862. The Japanese kinds are unquestionably the most popular for decorative purposes as well as for exhibition. They afford a wide choice in colour, form, habit and times of flowering. The incurred Chinese kinds are severely neat-looking flowers in many shades of colour. The anemone-flowered kinds have long outer or ray petals, the interior petals being short and tubular. These are to be had in many pleasing colours, the flowers being small, the petals being short. The plants are mostly dwarf in habit. In the single varieties the outer or ray florets alone are large and attractively coloured.

Plants for the Border.—As a border plant out of doors the chrysanthemum is of the easiest culture... It is an excellent good town plant. By a judicious selection of varieties, flowers may be produced in abundance and in considerable variety from August to the end of November, and in favourable seasons well on towards Christmas. It is a plant which is well suited for borders, and has been introduced to French raised varieties of exceptional merit, the border chrysanthemum has taken first place among hardy autumn flowering plants. Most of the varieties then introduced have been superseded by many excellent kinds developed in Britain.

Propagation.—The old English method of dividing the plants in March or early April may be followed where better means of propagation are not practicable. Many of the best border varieties are shy in producing new growths (suckers) from the rootstock, and it is necessary to propagate them by cuttings of the roots or other fresh material. If the frame can be heated at will so as to maintain a fairly even temperature of from 40° to 50° Fahren., roots will be made more quickly and with more certainty. A still better method is to improve a nursery bed of glass or a greenhouse, where the temperature is raised above 40° by artificial heat. This has the advantage of being accessible in all weathers. The bottom of the frame is covered with sifted coal ashes or coco-nut fibre, on which the shallow boxes or pots are placed. The propagating soil is composed of broken crocks, the bottoms of the boxes being drilled to allow water to pass out quickly. The soil should consist of about equal parts of fibrous loam and leaf-mould, half a part of coarse silver-sand, and a quarter of vegetable earth, taken from the garden refuse heap to each bushel of the compost. The whole is thoroughly mixed. The coarse leaf-mould, &c., from the sieve should be spread thinly over the drainage, and the boxes or pots filled almost to the rims with the compost, and

¹ The Gr. χρυσάνθεμον (xrona, gold, and δέμαν, flower) was the herbaeis' name for C. segetum, the "corn marigold," with its yellow bloom, and was transferred by Linnaeus to the genus, being commonly restricted now to the species C. sinense.
covered, if possible, with a thin layer of silver-sand. It should be pressed firmly, watered with a fine rose, and allowed to drain for an hour. The cuttings should then be dibbled into the boxes in rows, just clear, the soil being gently pressed around each. Short stout shoots will arise directly from the leaves in the box. In their absence cuttings from the stems are used. The ideal length for a cutting is about 2½ in. Cut the stem squarely with a sharp knife just below a joint, and remove the lower leaves. Insert as soon as possible and with a fine rose to settle the soil around them. The cuttings should be kept in a cool place and be well looked over daily, decayed leaves removed, and surplus moisture, condensed on the glass, wiped away. Ventilate gradually as rooting takes place, and, when well rooted, transfer singly into pots about 3 in. in diameter. Watch carefully and if necessary make separate one part leaf-mould, half a part coarse silver-sand, and a gallon of vegetable ash to every bushel of the compost. Return to the frames and keep close for a few days after to allow the little plants to recover. From time to time the pots should be gradually increased until the plants are able to bear full exposure during favourable weather, without showing signs of distress byflagging. They should be carefully protected at all times from cold cutting winds. In April should be the best period, as the rain may set in, the leaves may be dusted with tobacco-powder, and indoors also by fumigating. Mildew generally appears after the plants are housed. It may be destroyed by dusting the leaves attacked with sublimed sulphur. Rust is a fungoid disease of recent years. It is best checked by syringing the plants with liver of sulphur (1 oz. to 3 gallons of water) occasionally, a few weeks before taking the plants into the greenhouse. Each plant should be trapped on its own roots and not moved, so that the same place is occupied year after year.

Flowers for Exhibition.—The standards of exhibition standard must be as broad and as deep as the various varieties are capable of producing; they must be irreproachable in colour. They should also exhibit the form peculiar to the variety when at its best, very few kinds of plants combine all in one. New varieties are introduced in large numbers annually, some of which supplant the older kinds. The cultivator must therefore study the peculiarities of several new kinds each year if he would be a successful exhibitor.

For lists of varieties, &c., see the catalogues of chrysanthemum growers, the gardening Press, and the excellent cultural pamphlets which are published from time to time.

CHRYSANTHIUS, a Greek philosopher of the 4th century A.D., of the school of Lambichus. He was one of the favourite pupils of Aedesius, and devoted himself mainly to the mystical side of Neoplatonism (q.v.). The emperor Julian (q.v.) went to him by the advice of Aedesius, and subsequently invited him to come to court, and assist in the projected resuscitation of Hellenism. But Chrysanthus declined on the strength of unfavourable omens, as he said, but probably because he realized that the scheme was unlikely to bear fruit. For the same reason he abstained from transplanting his reputation, which he regarded as high-priest of Lydia. As a result of his moderation, he remained high-priest till his death, venerated alike by Christians and pagans. His wife Melite, who was associated with him in the priestly office, was a kinswoman of Eunapius the biographer.

CHRYSELEPHANTINE (Gr. χρυσός, gold, and ἀλεύρω, ivory), the architectural term given to statues which were built up on a wooden core, with ivory representing the flesh and gold the drapery. The two most celebrated examples are those by Pheidias of the statue of Athena in the Parthenon and of Zeus in the temple at Olympia.

CHRYSENE C₆H₁₃, a hydrocarbon occurring in the high boiling fraction of the coal tar distillate. It is produced in small quantity in the distillation of amber, on passing the vapour of phenyl-naphthyl-methane through a red-hot tube, on heating indene, or by passing the mixed vapours of coumarone and naphthalene through a red-hot tube. It crystallizes in plates or octahedra (from benzene), which exhibit a violet fluorescence, and melt at 250° C. Chromic acid in glacial acetic acid solution converts chrysenes to chrysene-CH₂OH, which when distilled with lead oxide gives chrysoether and H₂O. Chrysene fused with alkalis, chrysenic acid, C₆H₁₃O₃, is produced, which on heating gives β-phenyl-naphthalene. On heating chrysenes with hydriodic acid and red phosphorus to 265° C., the hydroderivatives C₆H₁₂ and C₆H₂₀₄ are produced. It gives characteristic addition products with picric acid and dinitroanthraquinone. Impure chrysenes is of a yellow colour; hence its name (χρύσος, golden yellow).

CHRYSSIPPUS (c. 280–206 B.C.), Greek philosopher, the third great leader of the Stoics. A native of Soli in Cilicia (Diog. Laert. vii. 179), he was robbed of his property and came to Athens, where he studied possibly under Zeno, certainly under Cleanthes. It is said also that he became a pupil of Arcesilaus and Lacydes, heads of the Middle Academy. This impartiality in his early studies is the key of his philosophic work, the dominant characteristic of which is comprehensiveness rather than originality. He took the doctrines of Zeno and Cleanthes and crystallized them into a definite system; he further defended them against the attacks of the Academy. His polemic skill earned for him the title of the "dunum of the Peripatos." Diogenes Laertius says, "If the gods use dialectic, they use none other than that of Chrysippus;", εν μιᾷ φαιν ἒν Χριστίνπος, οὗ τῷ Ἀνφικτον, τῷ τῷ Σωτῷ ("Without Chrysippus, there had been no Porch"). He excelled in logic, the theory of knowledge, ethics and physics. His relations with Cleanthes, contemporaneously recognized by Antipater, are considered under Stoics.
CHRYSOBERYL—CHRYSOPRASE

He is said to have composed seven hundred and fifty treatises, fragments alone of which survive. Their style, we are told, was unpolished and arid in the extreme, while the argument was lucid and impartial.

See G. H. Hagedorn, Moralia Chryspirae (1685); Ethica Chryspir (1715); J. F. Richter, De Chryspir Stoico fastuoso (1738); F. Boguet, De Chryspir vita doctrina et religiis (1822); C. Petersen, Philosophiae Chryspirae fundamenta (1827); A. Gercke, Chryspir in Joach. für Philologie, suppl. vol. xiv. (1888); J. Nicolai, De legatis Chryspiris libr (1895); Christoph Aronis, Κρήσιος χρυσοβέτριος (1885); R. Hirzel, Unterrschungen zu Ciceros philosophischen Schriften, ii. (1882); L. Stein, Die Psychologie der Sto (1889); A. B. Kirsch, Forschungen auf dem Gebiete der allm. Philosophie (1840); J. E. Sands, Hist. Class. Schol. i. 149.

CHRYSOBERYL, a yellow or green gem-stone, remarkable for its hardness, being exceeded in this respect only by the diamond and corundum. The name suggests that it was formerly regarded as a golden variety of beryl; and it is notable that though differing widely from beryl it yet bears some relationship to it inasmuch as it contains the element beryllium. In chrysoberyl, however, the beryllium exists as an aluminate, having the formula BeAlO₃, or BeO·Al₂O₃. The analysis of a specimen of Brazilian chrysoberyl gave alumina 78-10, berylla 17-94, and ferric oxide 4-88 %. The typical yellow colour of the stone inclines in many cases to pale green, occasionally passing into shades of dark green and brown. The iron usually present in the mineral seems responsible for the green colour. Chrysoberyl is often mistaken by its colour for chrysolite (q. v.), and has indeed been termed Oriental chrysolite. In its crystalline forms it bears some relationship to chrysolite, both crystallizing in the orthorhombic system, but it is a much harder and a denser mineral. As the two stones are apt to be confounded, it may be convenient to contrast their chief characters:

Chrysoberyl is not infrequently cloudy, opalescent and chatoyant, and is then known as "cyphomane" (Gr. κυψόμα, a "cloud"). The cloudiness is referable to the presence of multisomes of microscopic cavities. Some of the cryptohumus, when cut with a convex surface, forms the most valuable kind of cat's-eye (see Cat's-Eye). A remarkable dichroic variety of chrysoberyl is known as alexandrite (q.v.).

Most chrysoberyl comes from Brazil, chiefly from the district of Minas Novas in the state of Minas Gerais, where it occurs as small water-worn pebbles. The cryptohumus is mostly from the gem-graves of Ceylon. Chrysoberyl is known as a constituent of certain kinds of granite, pegmatite and gneiss. In the United States it occurs at Haddam, Conn.; Greenfield Centre, near Saratoga Springs, N.Y.; and in Manhattan island. It is known also in the province of Quebec, Canada, and has been found near Gwelo in Rhodesia.

(F. W. R.)

CHRYSOCOLLA, a hydrous copper silicate occurring as a decomposition product of copper ores. It is never found as crystals, but always as encrusting and botryoidal masses with a microcrystalline structure. It is green or bluish-green in colour, and often has the appearance of opal or enamel, being translucent and having a conchoidal fracture with vitreous lustre; sometimes it is earthy in texture. Not being a definite crystallized substance, it varies widely in chemical composition, the copper oxide (CuO) for example, varying in different analyses from 17 to 0 %; the formula is usually given as Cu₅Si₃O₈. The hardness (2-4) and specific gravity (5-1) are also variable. It has recently been suggested that the mineral may really be a mixture of more than one hydrous copper silicate, since differences in the microcrystalline structure of the different concentric layers of which the masses are built up may be detected. Various impurities (silica, &c.) are also commonly present, and several varieties have been distinguished by special names: thus dillenburgite, from Dillenburg in Nassau, contains copper carbonate; demidoffite and cyanocalcite contain copper phosphate; and pilarite contains alumina (perhaps as alloghite). The mineral occurs in the upper parts of veins of copper ores, and has resulted from their alteration by the action of waters containing silica in solution. Pseudomorphs of chrysocolla after various copper minerals (e.g. cuprite) are not uncommon. It is found in most copper mines.

The name chrysocolla (from χρυσός, gold, and κολλα, glue) was applied by Theophrastus and other ancient writers to materials used in soldering gold, one of which, from the island of Cyprus, may have been identical with the mineral now known by this name. Borax, which is used for this purpose, has also been called chrysocolla.

A mineral known as pitchy copper-ore (Ger. Kapfperchek), and of some importance as an ore of copper, is usually classed as a variety of chrysocolla containing much admixed limonite. It is dark brown to black in colour, with a dull to glassy or resinous lustre, and resembles pitch in appearance. In thin sections it is translucent and optically isotropic, and recent examinations seem to prove that it is a homogeneous mineral and not a mechanical mixture of chrysocolla and limonite. (L. J. S.)

CHRYSOLITE, a transparent variety of olivine, used as a gem-stone and often called peridot. The name chrysolite, meaning "golden stone" (χρυσός and κόλλα), has been applied to various yellowish varieties of olivine, notably to some kinds of beryl and to chrysoberyl. The true chrysolite of the modern mineralogist is a magnesium silicate, referable to the species olivine. It is appropriate to call the lighter coloured stones inclining to yellow chrysole, and the darker green stones peridot. Certain kinds of topaz, from the Schneckenstein in Saxony, are known as Saxon chrysole; while moldavite, a substance much like a green obsidian, is sometimes called water chrysole or pseudo-chrysole.

See Chrysoberyl; Olivine; Peridot.

CHRYSOLITAS, MANUEL [or EMMANUEL] (c. 1535-1415), one of the pioneers in spreading Greek literature in the West, was born at Constantinople of a distinguished family, which had removed with Constantine the Great to Byzantium. He was a pupil of Gemistus (q.v.). In 1393 he was sent to Italy by the emperor Manuel Palaeologus to implore the aid of the Christian princes against the Turks. He returned to Constantinople, but at the invitation of the magistrates of Florence he became about 1395 professor of the Greek language in that city, where he taught the Latin and Greek languages of Homer and Plato. Having visited Milan and Pavia, and resided for several years at Venice, he went to Rome upon the invitation of Bruni Leonardo, who had been his pupil, and was then secretary to Gregory XIII. In 1408 he was sent to Paris on an important mission from the emperor Manuel Palaeologus. In 1413 he went to Germany on an embassy to the emperor Sigismund, the object of which was to fix a place for the assembling of a general council. It was decided that the meeting should take place at Constance; and Chrysoloras was on his way thither, having been chosen to represent the Greek Church, when he died suddenly on the 15th of April 1415. Only two of his works have been printed, his Erotemata (published at Venice in 1484), which was the first Greek grammar in use in the West, and Epistolae III. de comparatione veteris et nove Romae.

JOHN CHRYSOLOTRAS, a relative of the above (variously described as his nephew, brother or son), who, like him, had studied and taught at Constantinople, and had then gone to Italy, shared the reputation of those who spread the influence of Greek letters in the West. His daughter married Filippo (q.v.).

CHRYSOPHASE (Gr. χρυσός, gold, and χρόνος, year), a name applied by modern mineralogists to an apple-green variety of chalcedony or hornstone, used as an ornamental stone. The colour is due to the presence of nickel, probably in the form of a hydrous silicate. By exposure to a moderate heat, or to strong light, the chryophase becomes paler, or even colourless, but it may regain its colour by absorption of moisture. Chryophase is a mineral of rather limited distribution. Most of it comes from the neighbourhood of Frankenstein in Silesia, where it occurs in association with altered serpentine. It is found to a limited extent at Rovdinsk, near Ekaterinburg, in the Urals; and it occurs also in India. It is known, too, at several localities.
in North America, notably at Nickel Mount, Douglas county, Oregon, where it occurs in nickeliferous serpentinite.

The chrysoprase of the moderns is certainly not the chrysoprasia of Pityus, or the χρυσόπρασια of Greek writers. The ancient stone was not improbably our chrysoberyll, and it is doubtful whether the modern chrysoprase was known until a comparatively late period. The chrysoprase of Kosemiitz, near Frankenstein in Silesia, was discovered in 1740, and used by Frederick the Great in the decoration of the palace of Sans Souci at Potsdam. But at a much earlier date the Silesian chrysoprase was used for mural decoration at the Wenzel chapel at Prague. Chrysoprase was a favourite stone in England at the beginning of the 15th century, being set round with small brilliants and used for brooches and rings. At the present time it is said to be regarded by some as a "lucky stone." Much commercial chrysoprase is chalcedony artificially stained by impregnation with a green salt of nickel.

( F. W. R. *)

CHRYSTOSTOM. St John Chrysostom (Χρυσόστομος, golden-mouthed), the most famous of the Greek Fathers, was born of a noble family at Antioch, the capital of Syria, about A.D. 345 or 347. At the school of Libanius the Sophist he gave early indications of literary powers, and would have been the successor of his heathen master, had he not been stolen away, to use the expression of his teacher, to a life of piety (like Augustine, Gregory of Nazianzus, and Theodoret) by the influence of his pious mother Anthusa. After his baptism (about 370) by Meletius, the bishop of Antioch, he gave up all his forensic prospects, and buried himself in an adjacent desert, where for nearly ten years he spent a life of ascetic self-denial and theological study, to which he was introduced by Diodorus, bishop of Tarsus, a famous scholar of the Antiochene type. Illness, however, compelled him to return to the world; and the authority of Meletius gained his services to the church. He was ordained deacon in his thirty-fifth year (381), and afterwards presbyter (386) at Antioch. On the death of Nectarius he was appointed archbishop of Constantinople by Eutropius, the favourite minister of the emperor Arcadius. He had, ten years before this, only escaped promotion to the episcopate by a very questionable stratagem—which, however, he defended with instructive and eloquent treatise De Sacerdotio. As a presbyter, he won high reputation by his preaching at Antioch, more especially by his homilies on The Statues, a course of sermons delivered when the citizens were justly alarmed at the prospect of severe measures being taken against them by the emperor Theodosius, whose statutes had been demolished in a riot.

On the archiepiscopal throne Chrysostom still persevered in the practice of monastic simplicity. The ample revenues which his predecessors had consumed in pomp and luxury he diligently applied to the establishment of hospitals; and the multitudes who were supported by his charity preferred the eloquent discourses of their benefactor to the amusements of the theatre or of the circus. His homilies, which are still preserved, furnish ample argument for the partiality of the people, exhibiting the free command of a pure and copious vocabulary, an inexhaustible fund of metaphors and similitudes, giving variety and grace to the most familiar topics, with an almost dramatic exposure of the folly of paganism and the moral emptiness of idolatry. His zeal as a bishop and eloquence as a preacher, however, gained him enemies both in the church and at the court. The ecclesiastics who were parted at his command from the lay-sisters (whom they kept ostensibly as servants), the thirteen bishops whom he deposed for simony and licentiousness at a single visitation, the idle monks who thronged the avenues to the court and found themselves the public object of his scorn—all conspired against the powerful author of their wrongs. Their resentment was inflamed by a powerful party, embracing the magistrates, the ministers, the favourite eunuchs, the ladies of the court, and Eudoxia the empress herself, against whom the preacher thundered daily from the pulpit of St Sophia. A favourable pretext for gratifying their revenge was discovered in the shelter which Chrysostom had given to four Nitrian monks, known as the tall brothers, who had come to Constantinople on being excommunicated by their bishop, Theophilus of Alexandria, a man who had long circulated in the East the charge of Origenism against Chrysostom. By Theophilus's instrumentality an edict was called to try or rather to condemn the archbishop; but fearing the violence of the mob in the metropolis, who idolized him for the fearlessness with which he exposed the vices of their superiors, it held its sessions at the imperial estate named "The Oak" (Symodus ad querum), near Chalcodon, where Rufinus had erected a stately church and monastery. A bishop and a deacon were sent to accuse the archbishop, and presented to him a list of charges, in which pride, inhospitality and Origenism were brought forward to procure the votes of those who hated him for his austerity, or were prejudiced against him as a suspected heretic. Four successive summonses were signified to Chrysostom, but he indignantly refused to appear until four of his notorious enemies were removed from the council. Without entering into any examination of the charges brought before them, the synod condemned him on the ground of contumacy, and, hinting that his audacity merited the punishment of treason, called on the emperor to ratify and enforce their decision. He was called hastily and hurriedly to leave the city in arrears.

As soon as the news of his banishment spread through the city, the astonishment of the people was quickly exchanged for a spirit of irresistible fury, which was increased by the occurrence of an earthquake. In crowds they besieged the palace, and had already begun to take vengeance on the foreign monks and sailors who had come from Chalcodon to the metropolis, when, at the entreaty of Eudoxia, the emperor consented to his recall. His return was graced with all the pomp of a triumphal entry, but in two months after he was again in exile. His fiery zeal could not blind him to the vices of the court, and needless of personal danger he thundered against the profane honours that were addressed almost within the precincts of St Sophia to the statue of the emperor. The haughty spirit of Eudoxia was inflamed by the report of a discourse commencing with the words—"Herodias is again furious; Herodias again dances; she once more demands the head of John;": and though the report was false, it sealed the doom of the archbishop. A new council was hastily sent to pronounce his condemnation, and summoned, more numerous and more subservient to the wishes of Theophilus; and troops of barbarians were quartered in the city to overawe the people. Without examining it, the council confirmed the former sentence, and, in accordance with canon 12 of the Synod of Antioch (341), pronounced his deposition for having resumed his functions without their permission.

He was hurried away to the desolate town of Cucusus (Cocysus), among the ridges of Mount Taurus, with a secret hope, perhaps, that he might be a victim to the Isaurians on the march, or to the more implacable fury of the monks. He arrived at his destination in safety; and the sympathies of the people, which had roused them to fire the cathedral and senate-house on the day of his exile, followed him to his obscure retreat. His influence also became more powerfully felt in the metropolis than before. In his solitude he had ample leisure for forming schemes of missionary enterprise among Persians and Goths, and by his correspondence with the different churches he at once baffled his enemies and gave greater energy to his friends. This roused the emperor to visit him with a severer punishment, though Innocent I. of Rome and the emperor Honorius recognized his orthodoxy and besought his return. An order was despatched for his removal to the extreme desert of Pityus; and his guards so faithfully obeyed their instructions that, before he reached the sea-coast of the Euxine, he expired at Comana in Pontus, in the year 407. His exile gave rise to a schism in the church, and the Johannists (as they were called) did not return to communion with the archbishop of Constantinople till the relics of the saint were, 30 years after, brought back to the Eastern metropolis with great pomp and the emperor publicly implored forgiveness from Heaven for the guilt of his ancestors. The festival of St Chrysostom is kept in the Greek Church on the 13th of November, and in the Latin Church on the 27th of January.

In his general teaching Chrysostom elevates the ascetic
element in religion, and in his homilies he inculcates the need of personal acquaintance with the Scriptures, and denounces ignorance of them as the source of all heresy. If on one or two points, as, for instance, the invocation of saints, some germ of substrosus Roman teaching may be discovered, there is a want of anything like the doctrine of indulgences or of compulsory private confession. Moreover, in writing to Innocent, bishop of Rome, he addresses him as a brother metropolitan, and sends the same letter to Venerius, bishop of Milan, and Chromatius, bishop of Aquileia. His correspondence breathes a most Christian spirit, especially in its tone of charity towards his persecutors. In exegesis he is a pure Antiochene, basing his expositions upon thorough grammatical study, and proceeding from a knowledge of the original circumstances of composition to a forceful and practical application to the needs of his day and of all time. With his exegetical skill (he was inferior in pure dogma to Theodore of Mopsuestia) he united a wide sympathy and a marvellous power of oratory.

The voluminous works of Chrysostom fall into three groups. To the days of his early desert life is probably to be assigned the treatise On Priesthood, a book full of wise counsel. To the years of his presbyterate and episcopate in the days of the great homilies are the addresses, among which those On the Statues, and Mathew, Romans and Corinthians, stand out prominently. His letters belong to the last years, the time of exile, and with his other works his historical value for the history of his time.

The manuscripts are very numerous, and many of them are of great antiquity, as are the Syriac and other translations. The best edition is that of Bernard de Montfaucon in 13 vols. fol. (1718–1738), reproduced with some improvements by Migne (Patrol. Graec. xviii). An edition is greatly indebted to the one issued more than a century earlier (1612) by Sir Henry Savile, provost of Eton College, from a press established at Eton by himself, which Hallam (Lit. of Europe. iii. 10, 11) calls "the first work of learning, or the grist, which through the hand of F. Field admirable, .. S. Matthew (Cambridge, 1839) and Epistles of S. Paul (Oxford, 1849–1855). J. A. Bengel's edition of De Sacerdotio (1725) has been often reprinted (e.g. Leipzig, 1887).

As authorities for the life, the most valuable are the ecclesiastical histories of Socrates, Chronicon and Theodoret; and amongst the moderns, Erasmus, Cave, Lardner and Tillemont, with the church history of Neander, and his monograph on the Life and Times of Chrysostom, translated by J. C. Stapleton. More recent are the lives of W. Sabin and W. Whitaker (1885) and A. Peuch (Paris, 1891). F. W. Farrar's romance Gathering Clouds gives a good picture of the man and his times. For monographs on special points such as Chrysostom's theological position and historical writings, see the valuable biographies by E. Preuschen's article in Herzog-Hauck's Realencycl. iv.; also A. Harnack, Hist. of Dogma. iii. and iv. Some of the commentators and homilies are translated in the Oxford Library of the Fathers.

CHUB (Leuciscus cephalus), a fish of the Cyprinid family, belonging to the same genus as the roach and dace. It is one of the largest of its family, attaining a length of 2 ft. and a weight of 5 to 7 lb. It does not avoid running waters, and is fond of insects, taking the fly readily, but its flesh, like that of the other Leucisc, is tasteless and full of bones. It is common in Great Britain and the continent of Europe. In America the name of "chub" is given to some other members of the family, and commonly to the horned dace (Semotilus aracmaculatus); well-known varieties are the river chub (Hybopsis kentuckiensis) and Columbia river chub (Myotichus calvinus).

CHUBB, Charles (d. 1845), English locksmith, started a hardware business at Walsheath; subsequently removing to Portsea in 1821, he invented the "dector" lock (q.v.), originally patented in 1818 by his brother, Jeremiah Chubb. He moved to London and then to Wolverhampton, where he employed two hundred hands. In 1835 he patented a process intended to render safes (q.v.) burglar-proof and fire-proof, and subsequently established a large safe-factory in London. He died on the 16th of May 1845, and was succeeded in the business by his son, John Chubb (1816–1872), who patented various improvements in the products of the firm and largely increased its output. The factories were combined under one roof in a model plant, and the business grew to enormous proportions.

After John Chubb's death the business was converted into a limited company under the management of his three sons.

CHUBB, Thomas (1679–1746), English deist, the son of a malster, was born at East Harnham, near Salisbury, on the 29th of September 1679. The death of his father (1688) cut short his education, and in 1694 he was apprenticed to a glove-maker in Salisbury, but subsequently entered the employment of a tallow-chandler. He picked up a fair knowledge of mathematics and geography, but theology was his favourite study. His habit of committing his thoughts to writing gave him a clear and fluent style. He made his first appearance as an author in the Arian controversy. A dispute having arisen about Whiston's argument in favour of the supremacy of the one God and Father, he wrote an essay, The Supremacy of the Father Asserted, which Whiston pronounced worthy of publication, and it was printed in 1715. A number of tracts followed, which were collected in 1730. For several years Chubb lived in the house of Sir Joseph Jekyll, master of the rolls, in what capacity it is not known; there are stories of his having waited at table as a servant out of his love of independence drew him back to Salisbury, where by the kindness of friends he was enabled to devote the rest of his life to the advancement of learning. He died on February 13, 1746. Chubb is interesting mainly as showing that the rationalism of the intellectual classes had taken considerable hold upon the popular mind. Though he acquired little renown in England he was regarded by Voltaire and others as among the most liberal of the deist school (see Deism). His principal works are A Discourse Concerning Reason (1731), The True Gospel of Jesus Christ (1739), and Posthumous Works, 2 vols. (1748), the last containing "The Author's Farewell to his Readers."

CHUBUT, a territory of the southern Argentine Republic, part of what was formerly called Patagonia, bounded N. by Rio Negro, S. by Santa Cruz, E. by the Atlantic and W. by Chile. Pop. (1895) 3748; (1904, estimate) 9600; area, 93,427 sq. m. Except for the valleys in the Andean foothills, which are fertile and well forested, and the land along the banks of the Chubut river, which flows entirely across the territory from the Andes to the Atlantic, the country is a barren waste, covered with pebbles and scanty clumps of dwarfed vegetation, with occasional shallow saline lakes. The larger rivers are the Chubut and the Senguer, the latter flowing into Lake Colhuapi. There are a number of lakes among the Andean foothills on the coast, and a large river of which are Fontana, La Plata and General Paz, and, in the interior, Colhuapi or Colhu and Musters, the latter named after the English naval officer who traversed Patagonia in 1870. Petroleum was found at Comodoro Rivadavia, in the S. part of the territory, toward the close of 1907, at a depth of 1768 ft. Chubut is known chiefly by the Welsh colony near the mouth of the Chubut river. The chief town of the Welsh, Rawson, is the capital of the territory, and Port Madryn on Bahia Nueva is its best port. Other colonies have been founded in the fertile valleys of the Andean foothills, but their growth is greatly impeded by lack of transportation facilities. (See further Patagonia.)

CHUDE, a tribal name used in both a special and a general sense. (1) It was the name given by the Russians to certain Estonian tribes with whom they came in contact as they spread gradually over their present empire. It would seem that the northern Chudes are the Vepdas, of whom about 21,000 are said to live near Lake Onega and in the northern parts of the government of Vologda and that the southern Chudes are the Votises who occupy about thirty parishes in north-west Ingeria. (2) As the Russians advanced eastwards they extended the name to various tribes whom they considered to be like the Estonians, and in popular use it has come to be applied to any ancient non-Russian people in Siberia, at least as far east as the Altai. In particular, ancient mines, tumuli and the metal work often found in them are commonly known as Chudish. Some investigators have used the word in a more restricted sense of Perman antiquities and their builders, but it seems to be a popular expression not corresponding to any historical or scientific division of mankind.
CHUGUYEV, a town of Russia, in the government of Kharkov, 25 m. E.S.E. of the town of Kharkov, on the right bank of the northern Donets. It is a place of some strategic importance, and had in 1897 a population of 11,877.

CHUKCHI, CHANKTUS ("Men") or TUSKI ("Brothers"), of Confederates), a Mongolid people inhabiting the northeasternmost portion of Siberia on the shores of the Arctic Ocean and Bering Sea. They are settled in small groups along the Arctic coast between the Bering Straits and the Kolyma river, or wander as far inland as the Anadyr basin. Though their territory embraces some 300,000 odd sq. m., the most trustworthy estimates put their numbers at but a few thousands. They were first carefully studied by the members of the Nordenskjold expedition (1878-79), who describe them as tall, lean, with somewhat irregular features—hence de Quatrefages classes them as "Allophylian Whites." The accounts of their physical characteristics are somewhat confused owing to the presence of the true Eskimo in the Chukchi domain. The typical Chukchi is round-headed, and thus distinct from the long-headed Eskimo, with broad, flat features and high cheek-bones. The nose is often so buried between the puffed cheeks that a ruler might be laid across the face without touching it. The lips are thick, and the brow low. The hair is coarse, lank and black. The general muscular development is good, though usually the body is stunted. It has been said that they are tattooed from the birth, probably from the Anmor basin. In their arctic homes they long carried on war with the Ongkilon (Ang-kali) aborigines, gradually merging with the survivors and also mixing both with the Kizmen Koryaks (g.v.) and the Chukhkmuit Eskimo settled on the Asiatic side of Bering Strait. Their racial characteristics make them an ethnological link between the Mongols of central Asia and the Indians of America. Some authorities affiliate them to the Eskimo because they are believed to speak an Eskimo dialect. But this is merely a trade jargon, a hotchpotch of Eskimo, Chukchi, Koryak, English and even Hawaiian. The true Chukchi language, of which Nordenfsjold collected a thousand words, is distinct from Eskimo and akin to Koryak, and Nordenskjold sums the problem up with the remark—"this race settled on the primeval route between the Old and New World bears an unmistakable stamp of the Mongols of Asia and the Eskimo and Indians of America."

The Chukchi are divided into the "Fishing Chukchi," who have settled homes on the coast, and the "Reindeer Chukchi," who are nomads. The latter breed reindeer (herds of more than 10,000 are not unusual), live on the flesh of the animal, which is fair, prosperous; while the fishing folk are very poor, begging from their richer kinsfolk hides to make tents and clothes. The Chukchi were formerly warlike and vigorously resisted the Russians, but to-day they are the most peaceable of folks, amiable in their manners, affectionate in family life and good-humoured. But this gentleness does not prevent them from killing off the old and infirm. They believe in a future life, but only for those who die a violent death. Thus it is regarded as an act of filial piety for a son to kill his parent or a nephew his uncle. This tribal custom is known as kamitok; and of it Mr Harry de Windt writes (Through the Gold Fields of Alaska to Bering Strait, 1888), "the doomed one takes a lively interest in the proceedings, and often assists in the preparation for his own death. The execution is always preceded by a feast, where seal and walrus meat are greedily devoured, and whisky consumed till all are intoxicated. A spontaneous burst of singing and the muffled roll of walrus-hide drums then herald the fatal moment. At a given signal a ring is formed by the relations and friends, the entire settlement looking on from the background. The executioner (usually the victim's son or brother) then steps forward, and placing his right foot behind the back of the condemned, slowly strangles him to death with a walrus thong. A kamitok took place during the latter part of our stay." The Chukchi are nominally Christians, but sacrifice animals to the spirits of the rivers and mountains, and also practise Shamanism. In personal habits the people are indescribably filthy. They are polygamous, but the women are treated kindly. The children are specially petted, and are so wrapped up to protect them from the cold that they have been described as resembling huge balls crossed by a bar, their arms having to remain outstretched owing to the bulk of their wrappings. Chukchi women are often tattooed with two black-blue convex lines running from the eye to the chin. Since their adoption of Christianity the men sometimes have a Latin cross tattooed on their chins. The Chukchi burn their dead or expose them on platforms to be devoured by ravens.

CHULALONGKORN, PHRA PARAMINDR MAHA (1853-1910), king of Siam, eldest son of King Maha Mongkut, was born on the 21st of September 1853. His full signature, used in all important state documents, consists of twenty-seven names, but it is by the first four that he is usually known. Educated in his childhood by English teachers, he acquired a good knowledge of the English language and of Western culture. But his surroundings were purely oriental, and his boyhood was spent, according to custom, in a Buddhist monastery. He succeeded the throne on the death of his father, 1st October, 1868, and was crowned on the 11th of November following, a ceremony marked by the innovation of permitting the presence of Europeans. Until his majority in 1873 the government was carried on by a regent, the young king retiring to a Buddhist monastery, and later making a tour through India and the Dutch East Indies, an undertaking until then without precedent among the potentates of eastern Asia. He had no sooner taken the reins of power than he gave evidence of his recognition of the importance of modern culture by abolishing slavery in Siam. He simplified court etiquette, no longer demanding, for example, that his subjects should approach him on hands and knees. Still more important, in view of the numerous races and creeds included among his subjects, was the proclamation of liberty of conscience. This was followed by the erection of schools and hospitals, the construction of roads and railways, and the further development of the army and fleet which his father had initiated. To him Siam is indebted for its standard coinage, its postal and telegraph service, and for the policing, sanitation and electric-lighting of Bangkok. Several of his sons, including the crown prince, were educated in England, and in the summer of 1875 he himself visited England, and during his stay in that country the 19th July, 1878, he was invested with the Order of the Garter.

CHUMB VALLEY, a valley connecting Tibet (g.v.) with the frontier of British India. Lying on the southern slopes of the Himalayas at an altitude of about 9500 ft. above the sea, the valley is wedged in between Bhutan and Sikkim, and does not belong geographically but only politically to Tibet. This was the route by which the British mission of 1904 advanced. Before the date of that expedition the valley had acquired a reputation for beauty and fertility, which was subsequently found to be only comparative in relation to the barrenness of the rest of the Tibetan frontier. The summer months, though not hot, are relaxing and enervating.

CHUNAR, or CHUNARGHUR, a town and ancient fortress of India, in the district of Mirzapur, in the United Provinces, situated on the south bank of the Ganges. Pop. (1901) 9926. The fort occupies a conspicuous site on the summit of an abrupt rock which commands the river. It was once a type of great strength, and still contains a magazine, and is fortified with batteries. In the old citadel on the height, the remains of a Hindu palace with some interesting carvings indicate the former importance of the place. The town, which consists of one or two straggling streets, contains a handsome English church. Chunar is first mentioned in the 16th century, when in possession of Singh Joapore. In 1530 it became the residence of Sher Shah the Afghan, and forty-five years later was recovered by the emperor Akbar after sustaining a siege of six months. It fell into the
hands of the English under General Carnac in 1769 after a prolonged resistance which caused considerable loss to the assailants. A treaty with the nawab of Oudh was signed here by Warren Hastings on behalf of the East India Company in September 1781.

CHUNCHO, a tribe of South American Indians, living in the forests east of Cuzco, central Peru. They are a fierce and savage people who have preserved their independence. They are said to be akin to their neighbours the Antis. They dwell in communal houses, and live chiefly by hunting. Chuncho has also been used to describe one of three aboriginal stocks of Peru, the others being Quichua and Aymara.

CHUNGKING, a city in the province of Szech'uen, China, on the left bank of the Yangtsze, at its point of junction with the Kialing, in 29° 33' N., and 107° 2' E. It is surrounded by a crenelated stone wall, which is 3 m. in circumference and is pierced by nine gates. It is the commercial centre for the trade, not only of Szech'uen, but of all south-western China. The one highway between Szech'uen and the eastern provinces is the Yangtsze river route, as owing to the mountainous nature of the intervening country, land transit is almost impracticable.

The import trade brought up by large junks from Ich'ang, and consisting of cotton cloth, yarn, metals and foreign manufactures, centres here, and is distributed by a class of smaller vessels up the various rivers of the provinces. Native produce, such as yellow silk, white wax, hides, rhubarb, musk and opium, is here collected and repacked for conveyance to Hankow, Shanghai or other parts of the empire. The city was opened to foreign trade by convention with the British government in 1851, with the proviso, however, that foreign steamers should not be at liberty to trade there until Chinese-owned steamers had succeeded in ascending the river. This restriction was abolished by the Japanese treaty of 1895, which declared Ch'ungking open on the same terms as other ports. After that date the problem of steam navigation on the section of the river between Ich'ang and Ch'ungking occupied attention. By 1907 a small steamer had been navigated up the rapids, but it remained a question how far steam navigation could be made a practical success. The trade was carried on by native craft, hauled up against the strength of the current in the worst places by a line of trackers on the bank. The great rise in the river during the summer months, at Ch'ungking ordinarily 70 ft. and occasionally as much as 96 ft., added to the difficulties. The population of Ch'ungking, including the city of Kiangpei on the opposite bank of the Kialing river, is about 300,000. The foreign residents are very few. In 1898 the value of the trade passing through the maritime customs was £2,614,000, and in 1904 £4,314,588, of which imports accounted for £2,644,777 and exports for £1,560,791.

CHUPATY, an Anglo-Indian term for an unleavened cake of bread. The word represents the Hindustani chapati, and is applied to the usual form of native bread, the staple food of upper India. The chapatty is generally made of coarse wheat flour, patted flat with the hand, and baked upon a griddle. In the troubled times that preceded the mutiny of 1857 chapattis were circulated from village to village throughout India, apparently as a token of discontent.

CHUPIYA (sometimes written Tshipia; Croatian Czipa), the capital of the Morava department of Servia, on the railway from Belgrade to Nish, and on the right bank of the Morava, which is navigable up to this point by small sailing-vessels. Pop. (1900) about 6000. Some of the finest Servian cattle are bred in the neighbouring lowlands, and the town has a considerable trade in plums and other farm-produce. A light railway, leading to several important collieries, runs for 13 m. through the beech-forests and mountains on the east. Cloth is woven at Parachin, 5 m. S.; and Yagodina, 8 m. W. by N., is an important market town. Among the foothills of the Golubin'ye Range, 7 m. E.N.E., is the 14th-century Ravanitsa monastery, with a ruined fort and an old church—their walls and frescoes pitted by Turkish bullets. There is a legend that here the Servian tsar Lazar (1374–1388) was visited by an angel, who bade him choose between an earthly and a heavenly crown. In accordance with his choice, Lazar fell fighting at Kosovo, and was buried at Ravanitsa; his body being afterwards transferred, through fear of the Turks, to another Ravanitsa, in eastern Slavonia. His crucifix is treasured among the monastic archives, which also contain a charter signed by Peter the Great of Russia (1672–1725). Manasia (Manasiya), the still more celebrated foundation of Stephen, the son and successor of Lazar, lies 12 m. N. of Ravanitsa. Built in a cleft among the hills which line the river Resava, an affluent of the Morava, this monastery is enclosed in a fortress, whose square towers, and curtain without loopholes or battlements, remain largely intact. Within the curtain stand the monastic buildings, a large garden and a cruciform chapel, with many curious old stone carvings, half hidden beneath whitewash. Numerous gifts from the Russian court, such as gospels lettered in gold and silver relief, or jewelled crucifixes, are preserved on the spot; but the valuable library was removed, in the 17th century, to Mount Athos.

CHUQUIASCA, a department of S.E. Bolivia, bounded N. by Cochabamba and Santa Cruz, E. by Santa Cruz and Brazil, S. by Tarija, and W. by Potosi. It lies partly upon the eastern plains of Bolivia and partly upon the great plains of the upper La Plata basin; area, 264,434 sq.m. It contains a large tributary of the Paraguay, crosses N.W. to S.E. the eastern frontier of the department. The climate of the lowlands is hot, humid and unhealthy, but that of the plateau is salubrious, though subject to greater extremes in temperature and rainfall. The seasons are sharply divided into wet and dry, the eastern plains becoming great lagoons during the wet season, and parched deserts during the dry. The mineral resources are important, but are less developed than those of Potosi and Oruro. Grazing is the principal industry of the plains, and cattle, sheep, goats and llamas are raised and cereals grown in the fertile valleys of the plateau. Three rough highways connect the department with its neighbours on the N. and W., and pack animals are the common means of transporting merchandise. The population was estimated at 204,434 in 1900, and is largely composed of Indians and mestizos. The plateau Indians are generally Aymaras, but on the eastern plains there are considerable settlements of partly civilized Chiriguanos, of Guarani origin. The department is divided into four provinces, the greater part of the lowlands being unsettled and without effective political organization. Its principal towns are Sucré, Camargo, Padilla and Yotala.

CHURCH, FREDERICK EDWIN (1826–1900), American landscape painter, was born at Hartford, Connecticut, on the 4th of May 1826. He was a pupil of Thomas Cole at Catskill, New York, where his first pictures were painted. Developing unusual technical dexterity, Church from the beginning sought for his themes such marvels of nature as Niagara Falls, the Andes, and tropical forests—he visited South America in 1853 and 1857,—volcanoes in eruption, and icebergs, the beauties of which he portrayed with great skill in the management of light, colour, and the phenomena of rainbow, mist and sunset, rendering these plausible and effective. In their time these paintings awoke the wildest admiration and sold for extravagant prices, collectors in the United States and in Europe eagerly seeking them, though their vogue has now passed away. In 1849 Church was made a professor of the New York Academy of Design. His "Great Fall at Niagara" (1857) is in the Corcoran Art Gallery, Washington, D.C., and a large "Twilight" is in the Walters Gallery, Baltimore, Maryland. Among his other canvases are "Andes of Ecuador" (1855), "Heart of the Andes" (1859), "Cotopaxi" (1862), "Jerusalem" (1870), and "Morning in the Tropics" (1877). He died on the 7th of April 1900, at his house on the Hudson river above New York city, where he had lived and worked for many years. He was the most prominent member of the so-called "Hudson River School" of American artists.

CHURCH, GEORGE EARL (1835–1910), American geographer, was born in New Bedford, Massachusetts, on the 7th of December 1835. He was educated as a civil engineer, and was early engaged on the Hoosac Tunnel. In 1858 he joined an exploring expedition to South America. During the American Civil War he
served (1862–1865) in the Army of the Potomac, rising to the command of a brigade and the rank of colonel; and in 1866–1867 he was war correspondent of the New York Herald in Mexico. He explored the Amazon (1868–1879), and gradually became the leading authority on that region of South America, being appointed United States commissioner to report on Ecuador in 1880, and visiting Costa Rica in 1885 to report on its debt and railways. He wrote extensively on South and Central American geography, and became vice-president of the Royal Geographical Society (London), and in 1898 president of the geographical section of the British Association.

CHURCH, SIR RICHARD (1784–1873), British military officer and general in the Greek army, was the son of a Quaker, Matthew Church of Cork. He was born in 1784, and at the age of sixteen ran away from home and enlisted in the army. For this violation of its principles he was disowned by the Society of Friends, but his father bought him a commission, dated the 3rd of July 1800, in the 13th (Somersetshire) Light Infantry. He served in the demonstration against Ferrol, and in the expedition to Egypt under Sir Ralph Abercromby in 1801. After the expulsion of the French from Egypt he returned home, but came back to the Mediterranean in 1805 among the troops sent to defend the island of Sicily. He accompanied the expedition which landed in Calabria, and fought a successful battle against the French at Maida on the 6th of July 1806. Church was present on this occasion as captain of a recently raised company of the Light Rangers. His zeal attracted the notice of his superiors, and he had begun to show his capacity for managing and drilling foreign levies. He was placed in command of the garrison of Capri from October 1806 till the island was taken by an expedition directed against it by Murat, in September 1808, at the very beginning of his reign as king of Naples. Church, who had distinguished himself in the defence, returned to Malta after the capitulation.

In the summer of 1809 he sailed with the expedition sent to occupy the Ionian Islands. Here he increased the reputation he had already gained by forming a Greek regiment in English pay. It included many of the men who were afterwards among the leaders of the Greeks in the War of Independence. Church commanded this regiment at the taking of Santa Maura, on which occasion his left arm was shattered by a bullet. During his slow recovery he travelled in northern Greece, and Macedonia, and to Constantinople. In the years of the fall of Napoleon (1813 and 1814) he was present as English military representative with the Austrian troops until the campaign terminated in the expulsion of Murat from Naples. He drew up a report to the Ionian Islands for the congress of Vienna, on which occasion he was recognized by the British flag, but of temporary occupation by Great Britain of Farga and a former Venetian coast on the mainland, then in possession of Ali Pasha of Iannina. The peace and the disbanding of his Greek regiment left him without employment, though his reputation was high at the war office, and his services were recognized by the grant of a companionship of the Bath. In 1817 he entered the service of King Ferdinand of Naples as lieutenant-general, with a commission to suppress the brigandage then rampant in Apulia. Ample powers were given him, and he attained a full measure of success. In 1820 he was appointed governor of Palermo and commander-in-chief of the troops in Sicily. The revolution which broke out in that year led to the termination of his services in Naples. He escaped from violence in Sicily with some difficulty. At Naples he was imprisoned and put on trial by the government, but was acquitted and released in January 1821; and King George IV. conferred on him a knight commandery of the Hanoverian order.

The rising of the Greeks against the Turks, which began at this time, had his full sympathy from the first. But for some years he had to act only as the friend of the insurgents in England. In 1827 he took the honourable but unfortunate step of accepting the command-in-chief of the Greek army. At the point of aarchy and discipline to which they had now fallen, the Greeks could no longer form an efficient army, and could look for salvation only to foreign intervention. Sir Richard Church, who landed in March, was sworn “archistrategos” on the 15th of April 1827. But he could not secure loyal co-operation or obedience. The rout of his army in an attempt to relieve the acropolis of Athens, then besieged by the Turks, proved that it was incapable of conducting regular operations. The acropolis capitulated, and Sir Richard turned to partisan warfare in western Greece. Here his activity had beneficial results, for it led to a rectification in 1832, in a sense favourable to Greece, of the frontier drawn by the powers in 1830 (see his Observations on an Eligible Line of Frontier for Greece, London, 1830). Church had, however, surrendered his commission, as a protest against the unfriendly government of Capo d’Istria, on the 25th of August 1829. He lived for the rest of his life in Greece, was created general of the army in 1854, and died at Athens on the 30th of March 1873. Sir Richard Church married in 1826 Elizabeth Augusta Wilmot-Horton, who survived him till 1878.

See Sir Richard Church, by Stanley Lane Poole (London, 1890); Sir Richard Church in Italy and Greece, by E. M. Church (Edinburgh, 1895), based on family papers (an Italian version, Brigantaggio e società segrete nelle Puglie, 1877–1882, executed under the direction of Carlo Lacaita, appeared at Florence in 1890). The MS. Correspondence and Papers of Sir Richard Church, in 29 vols., now in the British Museum, should yield valuable material for the history of the War of Greek Independence, including a narrative of the war during Church’s tenure of the command, which corrects many errors in the published accounts and brings vividly to life the campaigns against the army of Finlay, Mendelsohn-Bartholdy, and other historians of the war (see Cam. Mod. Hist. x. p. 804). (D. H.)

CHURCH, RICHARD WILLIAM (1815–1890), English divine, son of John Dearman Church, brother of Sir Richard Church (q.v.), a merchant, was born at Lisbon on the 25th of April 1815, his early years being mostly spent at Florence. After his father’s death in 1828 he was sent to a school of a pronounced evangelical type at Redlands, Bristol, and went in 1833 to Wadham College, Oxford, then an evangelical college. He took first-class honours in 1836, and in 1838 was elected fellow of Oriel. One of his contemporaries, Richard Mitchell, commenting on this election, said: “There is such a moral beauty about Church that they could not help taking him.” He was appointed tutor of Oriel in 1839, and was ordained the same year. He was an intimate friend of J. H. Newman at this period, and closely allied to the Tractarian party. In 1841 No. 90 of Tracts for the Times appeared, and Church resigned his tutorship. In 1844–1845 he was junior proctor, and in that capacity, in concert with his political colleague, he prepared a proposal to censure Tract 90 publicly. In 1846 Church, with others, started The Guardian newspaper, and he was an early contributor to The Saturday Review. In 1850 he became engaged to Miss H. F. Bennett, of a Somersetshire family, a niece of George Moberly, bishop of Salisbury. After again holding the tutorship of Oriel, he accepted in 1852 the small living of Whatley in Somersetshire, near Frome, and was married in the following year. He was a diligent parish priest and a serious student, and contributed largely to current literature. In 1869 he refused a canonry at Worcester, but in 1871 he accepted, most reluctantly (calling it “a sacrifice en pure perte”), the deanship of St Paul’s, to which he was nominated by W. E. Gladstone.

His task as dean was a complicated one. It was (1) the restoration of the cathedral; (2) the adjustment of the question of the cathedral revenues with the Ecclesiastical Commissioners; (3) the reorganization of a conservative cathedral staff with anomalous vested rights. He described the intention of his appointment to be “that St Paul’s should waken up from its long slumber.” The first year that he spent at St Paul’s was, with one of his friends, one of “misery” for a man who loved study and quiet and the country, and hated official pomp and financial business and ceremonious appearances. But he performed his difficult and uncongenial task with almost incredible success, and is said never to have made an enemy or a mistake. The dean was distinguished for uniting in a singular degree the virtues of austerity and sympathy. He was preeminently endowed with the faculty of judgment, characterized by Canon Scott Holland as the gift of “high and fine and sane
and robust decision." Though of unimpressive stature, he had a strong magnetic influence over all brought into contact with him, and though of a naturally gentle temperament, he never hesitated to express censure if he was convinced it was deserved. In the pulpit the voice of the dean was deliberately monotonous, and he employed no adventitious gesture. He may be described as a High Churchman, but of an essentially rational type, and with an enthusiasm for religious liberty that made it impossible for him to sympathize with any unbalanced or indiscriminate demands for deference to authority. He said of the Church of England that there was " no more glorious church in Christendom than this inconsistent English Church." The dean often meditated resigning his office, though his reputation as an ecclesiastical statesman stood so high that he was regarded in 1882 as a possible successor to Archbishop Tait. But his health and mode of life made it out of the question. In 1888 his only son died; his own health declined, and he appeared for the last time in public at the funeral of Canon Liddon in 1890, dying on 9th December 1890, at Dover. He was buried at Whatley.

The dean's chief published works are a Life of St Anselm (1870), the lives of Spencer (1879) and Bacon (1884) in Macmillan's "Men of Letters" series, an essay on Dante (1878), The Oxford Movement (1891), together with other volumes of his. A selection of his journalistic articles was published in 1897 as Occasional Papers. In these writings he exhibits a great grasp of principles, an accurate mastery of detail, and the same fusion of intelligent sympathy and dispassionate judgment that appeared in his handling of business. His style is lucid, and has the charm of sincerity. He stated that he had never studied style per se, but that he had acquired it by the exercise of translation from classical languages; that he watched against the temptation of using unusual and fine words; that he employed care in his choice of verbs rather than in his use of adjectives; and that he fought against self-indulgence in writing just as he did in daily life. His sermons have the same quality of self-restraint. His private letters are fresh and simple, and contain many unaffected epigrams; in writing of religious subjects he resolutely avoided dogmatism without ever sacrificing precision. The dean was a man of genius, whose moral stainlessness and instinctive fire were indicated rather than revealed by his writings.

See Life and Letters of Dean Church, by his daughter, M. C. Church (1897) and by H. C. Beeching in Dict. Nat. Biog.; and D. C. Lathbury, Dean Church (1897). (A. C. Be.)

CHURCH (according to most authorities derived from the Gr. kyrissos [kýrissos], " the Lord's [house]," and common to many Teutonic, Slavonic and other languages under various forms—Scottish kirk, Ger. Kirche, Swed. kyrka, Dan. kirke, Russ. tsirkon, Bulg. cerkova, Czech cirkon, Finn. kirko, &c.), a word originally applied to the building used for Christian worship, and subsequently extended to the Christian community (ecclesia) itself. Similarly the Greek word ecclesia (ekklesia), " assembly," was very early transferred from the community to the building, and is used in both senses, especially in the modern Romance and Celtic languages (e.g. Fr. église, Welsh eglwys, &c.).

(i) Architecture.—From the strictly architectural point of view the subject of church building, including the development of the various styles and the essential features of the construction and arrangement of churches, is dealt with elsewhere (see Architecture; Abbey; Basilica). It is, however, impossible to understand the development and meaning of church architecture without some knowledge of that of the sacred building and ritual of the Christian Church as a religious community, and a brief sketch of this connexion may be given here by way of introduction to the more technical treatment of the subject. In general it may be said of church architecture, more truly than of any other, that artistically it is "frozen music." It is true that at all times churches have been put to secular uses; in periods of unrest, as among the Nestorian Christians now, they were sometimes built to serve at need as fortresses; their towers were used for beacons, their naves for meetings on secular affairs. But as a rule, and especially in the great periods of church architecture, their builders were untrammeled by any utilitarian considerations; they built for the glory of God, for their own glory perhaps, in honour of the saints; and their work, where it survives, is (as it were) a petrifaction of their beliefs and ideals. This is, of course, more true of the middle ages than of the times that preceded and followed them; the Church under the Roman empire hardly as yet realized the possibilities of "sermons in stones," and took over, with little change, the model of the secular and religious buildings of pagan Rome; the Renaissance, essentially a neo-pagan movement, introduced disturbing factors from outside, and, though developing a style very characteristic of the age that produced it, started that archaeological movement which has tended in modern times to substitute mere imitations of old models for any attempt to express in church architecture the religious spirit of the age.

The earliest type of Christian Church, out of which the others developed, was the basilica. The Church, emerging in the 4th century into imperial favour, and established as part of the organization of the Roman empire, simply adopted that type of secular official building which she found convenient for her purposes. The clergy, now Roman officials, vested in the robes of the civil dignitaries (see Vestments), took their seats in the assembly of the popular rallies, in a state of part-recline, in front of them the holy table, facing the congregation. The cancelli, the lattice or bar, which in the civil tribunal had divided the court from the litigants and the public, now served to separate clergy and laity. This arrangement still survives in some of the ancient churches of Rome; it has been revived in many Protestant places of worship. It symbolized principally an official distinction; but with the theocratizing of the empire in the East and its decay in the West the accentuation of the mystic powers of the clergy led to a more complete separation from the laity, a tendency which left its mark on the arrangements of the churches. In the East the cancelli, under the influence possibly of the ritual of the Jewish temple, developed into the iconostasis, the screen of holy pictures, behind the closed doors of which the supreme act of the eucharistic mystery is hidden from the lay people. In the West the high altar was moved to the east end (the presbyterium) with a space before it for the assisting deacons and subdeacons (the chancel proper) railed off as a spot peculiarly holy (now usually called the sanctuary); between this and the nave were, at first, two rows of seats, and later the clergy on either side. The whole of this space (sanctuary and choir) came to be known as the "chancel." This was divided from the nave, sometimes by an arch forming part of the structure of the building, sometimes by a screen, or by steps, sometimes by all three (see Chancel). The division of churches into chancel and nave, the outcome of the sacramental and sacerdotal spirit of the Catholic Church, may be taken as generally typical of church construction in the medieval West, though there were exceptions, e.g. the round churches of the Templars. There were, however, further changes, the result partly of doctrinal developments, partly of that passion for symbolism which by the 13th century had completed the evolution of the Catholic ritual. Transepts were added, to give to the ground-plan of the building the figure of the cross. The insistence on the unique efficacy of the sacrifice of the altar led to the multiplication of masses, and so of altars, which were placed in the transepts or aisles or in chapels, dedicated to the saints whose relics they enshrined. The chief of these subsidiary chapels, that of the Blessed Virgin (Lady chapel), became the high altar of the church. Finally, for the convenience of processions, the nave and chancel aisles were carried round behind the high altar as ambulatories.

The Romanesque churches, still reminiscent of antique models, had preserved all the simplicity of the ancient basilicas with much more than their grandeur; but the taste for religious symbolism which culminated in the 13th century, and the imaginative genius of the northern peoples, transformed them into the marvellous dreams in stone of the "Gothic" period. Churches now became, in form and decoration, epitomes of the Christian scheme of salvation as the middle ages understood it.
In the plan of the buildings and their decoration everything still remained subordinate to the high altar; but though on this and its surroundings ornament was most lavishly expended, the churches—wherever wealth permitted—were covered within and without with sculpture or painting: scenes from the Old and New Testaments, from the lives of saints, even from every-day life; figures of the Almighty, of Christ, of the Virgin Mother, of apostles, saints, confessors; pictures of the joys of heaven and the torments of hell; and outside, grimacing from every angle, demons and goblins, amusing enough to us but terrible to the age that set them there, visible embodiments of the evil spirits driven from within the sacred building by the efficacy of the holy rites.

In considering the origins of medieval churches, moreover, it must be borne in mind that as a general rule their builders were not actuated by the motives usual in modern times, at least among Protestants. The size of churches was not determined by the needs of population but by the piety and wealth of the founders; and the same applies to their number. Often they were founded as acts of propitiation of the Almighty or of the saints, and the greater their size and splendour the more effective they were held to be for their purpose. But in all rivalries, too, it is necessary to note that one wealthy abbey building “against” another, much in the same way as modern business houses endeavour to outshine each other in the magnificence of their buildings. Of all the mixed motives that went to the evolution of church architecture in the middle ages, this rivalry in ostentation was probably the most fertile in the creation of new forms. A volume might be written on the economic effects of this locking up of vast capital in unproductive buildings. In Catholic countries (notably in Ireland) great churches are still built out of the savings of a poverty-stricken peasantry; and from this point of view the destruction of churches in the 16th century was probably a benefit to the world. However, this is a consideration altogether alien to the Christian spirit, the aspiration of which is to lay up treasures not on earth but in heaven.

The Reformation was a fateful epoch in the history of church architecture. The substitution of the Bible for the Mass destroyed the raison d’être of churches as the middle ages had made them. Pictures and stories, carved or painted, seemed no longer necessary now that the open Bible was in the hands of the common people; they had been too often prostituted, moreover, to idolatrous uses,—and “idolatry” was the worst of blasphemies, to the re-discoverers of the Old Testament. Save in some parts of Germany, where the influence of Luther saved the churches from wreck, an iconoclastic wave spread over the greater part of Western Europe, wherever the “new religion” prevailed; everywhere churches were cleared of images and reduced to the state of those described by William Harrison in his Description of England (1570), only the “pictures in glass” being suffered in some cases to survive for a while “by reason of the extreme cost of replacing them.” The structures of the churches, however, remained; and these, even in countries which departed furthest from the Catholic system, served in some measure to keep its tradition alive. Protestantism has, indeed, produced a distinctive church architecture, i.e. the conventicle type, favoured especially by the so-called “Free Churches.” Its distinctive features are pulpit and auditorium, and it is symbolical of the complete equality of ministers and congregation. In general, however, Protestant builders have been content to preserve or to adapt the traditional models. It would be interesting in this connexion to trace the reverse effect of church architecture upon church doctrine. In England, for instance, the chancels were for the most part disused after the Reformation (see Harrison, op. cit.), but presently they came into use again, and on the Catholic revival in the Church of England in the 19th century it is certain that the medieval churches exercised an influence by giving a sense of fitness, which might otherwise have been lacking, to the restoration of medieval ritual. A similar tendency has of late years been displayed in the Established Church of Scotland.

Churches, as the outcome of the organization of the Catholic Church, are divided into classes as “cathedral,” “collegiate,” “parochial,” and “district” churches. It must be noted, however, that the term cathedral (q.v.), ecclesiastically applicable to any church which happens to be a bishop’s see, architecturally connotes a certain size and dignity, and is sometimes applied to churches which have never been, or have long ceased to be, bishop’s seats.

(W. A. P.)

(2) The Religious Community.—In the sense of Christian community (ecclesia) the word “Church” is applied in a narrow sense to any one of the numerous separate organizations into which Christendom is divided (e.g. Roman Catholic Church, Orthodox Eastern Church, Church of England, Evangelical [Lutheran] Church)—these are dealt with under their several headings—and in a comprehensive sense (with which we are now concerned) to the general body of all those “who profess and call themselves Christians.” Religion, according to the old definition, is the bond which binds the soul of man to God. It begins as the relation of a tribe to its God. Personal religious conviction grows out of the tribal (corporate) religious bond. But the social instinct is strong. Men owning the same religious convictions will naturally draw together into some sort of association. Using the word religion to cover all the imperfect ways in which men have felt after God, we note that in every case men have found the need alike of a teacher and of fellowship. Thus the idea of a church as “the pillar and ground of the truth” (1 Tim. iii. 15) corresponds to some of the primary needs of man. Even at Stonehenge, the oldest relic of prehistoric religion in England, where we picture in imagination the worship of the rising sun, nature worship degraded to a horrible depth by human sacrifice, we find struggling for expression the idea of a corporate religious life. From all the lower levels where superstition and cruelty reign, from the depths of fear inspired by fetichism, we look on to the higher level of Judaism as the progressive religion of the old world. This does not mean that we shut our eyes to the ideals of Greek philosophers, with whom morality was constantly outgrowing religion. “The vision of an ideal state which the master-mind of Plato contemplated, but thought too good ever to become true in actual realisation, is full of aspirations which the Christian Church claims to satisfy. The problems of the relations of the life of the State and the life of the individual, which Aristotle ever suggests and never solves, are problems with which the Christian Church has at least attempted to deal.”

From the beginning of the history of the Jewish race the idea that the world is a kingdom under the rule of God began to find expression. The conception of Israel as “a kingdom of priests and an holy nation” (Exod. xix. 6) bore witness to it. The idea of kingship from the first was that of a ruler representing God. As time went on and even the dynasty of David failed in the persons of unworthy representatives to maintain this ideal, both psalmists and prophets taught the people to look beyond the earthly kingdom to the spiritual kingdom of which it was a type. But even Isaiah tended to think of the spiritual life and worship of the nation as a department of political organization only, controlled by the king and his princes. It was reserved for Jeremiah, in the darkest days of his life, to build up the ideal of a spiritual society which should weld Israel together, who should be one man (XXX. 23-24) which Jehovah would make with Israel when representatives of the previously exiled ten tribes should return with the exiles of Judah. This prophecy is instinct with the growing sense of the personal responsibility of individual men brought into communion with God. The religion of Israel from this time of the captivity ceased to be a merely national religion connected with particular forms of sacrifice in a particular land. The synagogues which traced their origin to the time of Ezekiel, when the sacrificial cultus was impossible, extended this ideal yet further. During the centuries preceding the birth of Christ there grew up an apocalyptic literature which regarded as a primary truth the conception of a

1. Lacantius, Inst. Div. iv. 28 "Vinculo pietatis obstricti, Deo religatis sumus unde ipsa religio nomen accepit. The etymology may be wrong, but this is the popular sense of the word.

kingdom of righteousness ruled over by a present God. The
preaching of John the Baptist was thus in sympathy with the
ideals of his generation, though the sternness of the repentance
which he set forth as the necessary preparation for entrance into
the new kingdom of heaven, which was to be made visible
on earth, was not less repugnant to the men of his day than of later
times. Christ’s own teaching and that of his disciples began with
the proclamation of the kingdom of God (or of heaven) (Luke iv.
38, viii. 1, ix. 2; Matt. x. 7). That he intended it to find outward
expression in a visible society appears from the careful
way in which he trained the apostles to become leaders hereafter,
crowning that work by the institution of the sacraments of
baptism and the Eucharist. “It was not from accident or for
convenience that Christ formed a society.”†1 Parables even
more than his sermons reveal the principles of his endeavour.
But he seldom used the word ecclesia, church, which became the
universal designation of his society.
All the more emphatic is Christ’s use of the term ecclesia upon
the distinct advance in faith made by the apostles when St Peter
acted as their spokesman confessed him to be the “Christ, the Son of
the living God” (Matt. xvi. 16). Instantly came the reply, “I
say unto thee, that thou art Peter (rock); and on this Peter
(rock) I will build my ecclesia (church); and the gates of Hades
shall not prevail against it.”†2 On the rock of a human character,
ennobled by faith in his divine Sonship, he could raise the church of
God, which should be at the same time continuous with the
old, new in spiritual power, one in worship and in work.
To the Jews the word ecclesia as used in the Septuagint suggested
the assembly of the congregation of Israel. To a Greek it
suggested the assembly of freeborn citizens in a city state.
Without ceasing to be the congregation of Jehovah, it would
claim for itself all the hopes of an ideal state over which Greek
philosophers had sighed in vain.
Opinions differ upon the question whether the apostles were
called to be representatives of the ecclesia to be founded (Hort) or
as men fitted to become its duly authorized teachers and leaders
from the beginning (Stone). But as Mr Stone well puts it, “It
would not be a necessary inference [from Dr Hort’s opinion] that
there ought to be no ministry in the Christian Church.”†3
At first the church was limited to the Christian believers in
the city of Jerusalem, then by persecution their company was broken
up, and, since those who were scattered went everywhere
preaching the word, the conception was enlarged to include all
of the way” (Acts ix. 2) in the Holy Land. A new epoch
began with the return of St Paul and St Barnabas to Antioch
after their first missionary journey, when they called together
the church with preachers from their experiences, and told how “God
had opened to the Gentiles the door of faith” (Acts xiv. 27). Hitherto
the term Church had been “ideally conterminous” with the
Jewish Church. Now it was to contain members who had never
in any sense belonged to the Jewish Church. Thus the way was
open for new developments and for illimitable extension.
St Paul, in his address to the elders at Ephesus (Acts xx. 28),
adapted the words of Ps. lxxxiv. 2, “Remember thy congregation,
which thou hast purchased of old,” claiming for the Christian
ecclesia the title of God’s ancient ecclesia. But he never, how-
ever fiercely opposed by Judaizers, set a new ecclesia of Christ in
opposition to the old. We wait, however, for the Epistles of his
captivity at Rome to find the full meaning of the idea of the
cruch dawning upon his imagination. “Here at least, for the
first time in the Acts and Epistles, we have the ecclesia spoken of
in the sense of the one universal ecclesia, and it comes more from
the theological than from the historical side; i.e. less from the
actual circumstances of the actual Christian communities than
from a development of thoughts respecting the place and oflice of
the Son of God: his headship was felt to involve the unity of all
those who were united to him.”†4 Similar development of the
idea of the one ecclesia as including all members of all local

† Eccles Homo, ed. 5, p. 87. Cf. the interesting comparison between
Socrates and Christ.

ecclesia does not lead St Paul to regard membership of the
universal church as invisible.

But the mere history of the word ecclesia does not exhaust the
subject. We must take into account not only the idea of the visible
actual church, but also the idea pictured by St Paul in the
metaphors of the Body (Rom. xii. 5), the Temple (1 Cor. iii.
10-15) and the Bride of Christ (2 Cor. xi. 2). The actual church
is always falling short of its profession; but its successive reforma-
tions witness to the strength of its longing after the beauty of
holiness.

Membership in the actual church is acquired through baptism
“in the name of the Father and of the Son and of the Holy Ghost”
(Matt. xxviii. 19). The references in the New Testament to
baptism “in the name of Jesus” (or the Lord Jesus) (Acts ii.
38, viii. 16, x. 48, xix. 5; Rom. vi. 3; Gal. iii. 27), which are
by some critics taken to refer to a primitive Christological
baptismal formula, seem to refer to the confession made by the
baptized, or to the new relationship into which they are brought
as “members of Christ.”†5 Candidates for baptism were exorted
to prepare for it by repentance and faith (Acts ii. 38). The
laying on of hands (Heb. vi. 2), in the rite called in later times
confirmation, followed baptism (Acts viii. 17). In the modern
Greek Church it is administered by priests with oil which has
been consecrated by the bishop, in the Roman Church by the
bishop himself. Such use of the chrism can be traced from the
pagan mysteries. The connotation of the chrism is symbolized by the
Biblical expression “the washing of the body.” Presbyterian
and other Protestant churches have abandoned the use, except
the Lutherans. We need not here trace the history of Christian
worship, in daily services (Acts ii. 46), or on the Lord’s Day
(Acts xx. 7), meeting for the Lord’s Supper (1 Cor. xi. 17-34), or
for mutual edification in prayer, praise and prophecy (1 Cor. xiv.).
These things represent the ideal of Christendom. In the words of
an eminent Roman Catolic scholar, Monsignor Duchesne,
“Faith unites, theology often separates.” It must be our task to
summarize the leading ideas of the church in which all Christians are
agreed.

(a) The first is certainly fellowship with Christ and with the
brethren. The early Christians earnestly believed that their life
was “hidden with Christ in God” (Col. iii. 3), and found in
their union with Christ the last and strongest motive of love
to the brethren. Such fellowship is attributed by St Paul
pre-eminently to the work of the Holy Spirit (2 Cor. xiii. 14).
Its strength is shown in England in the growing readiness of the
different religious bodies to co-operate in movements for the
purifying of public morals and for the better observance of Sunday.
(b) The second is unity. We have seen how St Paul was led
to grasp the conception of one church universal manifested
in all the local churches. Its unity is not purely accidental in that
individuals have been forced to act together under pressure of
chance circumstances. Nor is the ideal of unity adopted
simply because experience teaches that “union is strength.”
Nor is it even based on the philosophical conception of the
incompleteness of the individual life. As Dr Sanday finely
says, “If the church is in something more than mere metaphor
the Body of Christ, if there is circulating through it a continual
flow and return of spiritual forces, derived directly from him, if
the Spirit which animates the Body is one, then the Body itself
must also be in essence one. It has its centre not on earth but in
heavenly places, where Christ sitteth at the right hand of God.”†6

(c) Thirdly, there is no question that the Lord intended the one
fellowship of his saints to be a visible fellowship. The idea
of an invisible church has only commended itself in dark hours
when men despaired of unity even as an ideal. The view of
Zwingli and Calvin in the 16th century was not by any means
acceptable to other reformers. Luther distinguished between
the Spiritual Church, which he identified with the Communion
of Saints, and the Corporeal Church, the outward marks of which
are Baptism, Sacrament and Gospel. But he regarded them

† For a full defence of the authenticity of Matt. xxviii. 19, see
Rigenbach, Der Irwirteutische Taufbeischian (Gutterslo, 1993).

† The Conception of Priesthood, p. 13.
as different aspects of the same church, and Melanchthon was even more explicit.\(^1\) As the saint purified in heaven is he who struggled with his sins on earth, so is the church triumphant one with the church militant. In Dr Lindsay's words, "it is one of the privileges of faith, when strengthened by hope and by love, to see the glorious ideal in the somewhat poor material reality. It was thus that St Paul saw the universal Church of Christ made visible in the Christian community of Corinth.\(^2\)

But it is at this point that we come to the dividing line which has been drawn by different conceptions of catholicity. Dr Lindsay goes on to argue that all insistence on the principle of historical continuity, whether urged by members of the Anglican or the Roman Catholic Church, as upholders of episcopacy, is a deliberate return to the principle of Judaism, which declared that no one who was outside the circle of the "circumcised," no matter how strong his faith nor how the fruits of the Spirit were manifest in his life and deeds, could plead "the security of the Divine Covenant." Without entering into controversy it must suffice to point out that, from the point of view of all episcopal churches, the ministry of the bishops succeeding the ministry of the apostles, however it came to pass, was for fifteen centuries accepted as the pledge of unity. This principle, however, of continuity in ministry, belongs to a different department of Christianity, and the Church of Rome in those centuries corresponds to the Jewish rites of admission to the temple. And it has been an established principle of the undivided church since the 3rd century, the bishop of Rome in this case upholding against St. Cyprian the view which subsequent generations have ratified as Catholic truth, that baptism by whosoever administered is valid if water is used with the right words. From this point, alas, divergence begins.

(d) The fourth element is authority. Probably all Christians can agree in the statement that the Christian democracy is also a theocracy, that Christ is the source of all authority. There are three passages in the Gospel which claim notice: (i.) the promise to St Peter (Matt. xvi. 18), as spokesman for the apostles, of the key of the household of God, of power to admit and exclude; (ii.) the promise (Matt. xviii. 15–20) probably given to the Twelve, regarding offences against the peace of the society, advocating exclusion only when brotberly appeals have failed; (iii.) the commission of the whole ecclesia or of the Christian ministry (John xx. 22, 23). Again the root difference between the Presbyterian and Episcopalian conceptions of the church comes to light. The Christian virtue of unity manifest in the decisions which a local church arrives at by a majority of votes, or in the decisions of apostles and prophets after taking counsel, of the episcopate in later times, ratified by common consent of Christendom. As has been well said, "the church is primarily a witness—the strength of its authority lies in the many sides from which the witness comes." It witnesses to the Divine Life of Christ as a power of the present and of the future as of the past, ministered in the Word and sacraments.

(e) The church is a sacerdotal society. St. Paul delighted to represent it as the "ideal Israel," and St John echoes the thought in the words of praise (Rev. i. 5, 6), "Unto him that hath loved us ... and made us to be a kingdom, and priests unto his God and Father." This idea of the priesthood of the whole church has three elements—the divine element, the human element and self-sacrifice. The promise that Christians should be temples of the living God has been fulfilled. As Dr Milligan has said very well, "It is not only in things to which we commonly confine the word miracle that the Divine appears. It may appear not less in the whole tone and spirit of the Church's life, in the varied Christian virtues of its members, in the general character of their Christian work, and in the grace received by them in the Christian sacraments. When that life is exhibited, as it ought to be, in its distinctively heavenly character, it bears witness to the presence of a power in Christian men which no mere recollection of a past example, however heroic or beautiful, can supply. The difficulties of exhibiting and maintaining it are probably far greater now than they were in the apostolic age; and as nothing but a present divine support can enable us to overcome so, when they are overcome, a testimony is given to the fact that God is with us."\(^3\)

But this life is to be a human life still, to be in touch with all that is noble and of good report in art and literature, keenly interested in all the discoveries of science, active in all movements of social progress. It cannot, however, be denied that to live such a life, divine in its powers and human in its sympathies, demands daily and hourly self-sacrifice. As the author of the Imitation of Christ put it long ago, "There is no living in love without pain." The thought of self-sacrifice has been emphasized from the earliest times in the liturgies. By a true instinct the early Christian writers called widows and orphans the altar of God on which the sacrifices of almsgiving are offered up.\(^4\) Such works of charity, however, represent only one of the channels by which self-sacrifice is ministered, to which all prayers and thanksgiving and instruction of psalms, prophecy and preaching contribute. Thus in the Eucharist the offering of the church is made one with the offering of the Great High Priest.\(^5\)

All this represents an ideal. It suggests in a modern form the perpetual paradox of the Christian life: we are what we are not. The church, which is a community of which all other religious associations are eventually to find their home, "Thy kingdom come," embraces all spiritual forces which make for righteousness. They were acknowledged in Christ's words, "He that is not against you is for you" (Luke ix. 50). But the divisions of Christendom testify to the harm done by undue insistence on the claims of the individual to gain scope to extend the kingdom in his own way. As in a choir all the resources of an individual voice are used to strengthen the general effect, so must the individual lose his life that he may find it, witnessing by his share in the common service of the church to the ultimate unity of knowledge and harmony of truth.

For the various conceptions of the church as an organized body see Church History, sec. 3, and the articles on the various churches.

**CHURCH ARMY**, an English religious organization, founded in 1882 by the Rev. Wilson Carile (afterwards prebendary of St Paul's), who banded together in an orderly army of "soldiers" and "officers" a few working men and women, whom he and others trained to act as "Church of England evangelists" among the outcasts and criminals of the Westminster slums. Previous experience had convinced him that the moral condition of the lowest classes of the people called for new and aggressive action on the part of the Church, and that this work was most effectively done by laymen and women of the same class as those whom it was desired to touch. "Evangelistic zeal with Church order" is the principle of the Church Army, and it is essentially a working men's and women's mission to working people. As the work grew, a training institution for evangelists was started in Oxford, but soon moved (1886) to London, where, in Bryanston Street near the Marble Arch, the headquarters of the army are now established. Working men are trained as evangelists, and working women as mission sisters, and are supplied to the clergy. The men evangelists have to pass an examination by the archdeacon of Middlesex, and are then (since 1896) admitted by the Bishop of London to lay evangelists in the Church;\(^6\) the mission sisters must likewise pass an examination by the diocesan inspector of schools. All Church Army workers (of whom there are over 1,800 of one kind and another) are entirely under the control of the incumbent of the parish to which they are sent. They never go to a parish unless invited, nor stay when asked to go by the parish priest. Officers and sisters are paid a limited sum for their services either by the vicar or by voluntary local contributions. Church Army mission and colportage vans circulate throughout the county parishes, if desired, with

3 *The Ascension*, p. 254.
5 This teaching is not confined to Episcopalian writers. It has been finely expressed from the Presbyterian standpoint by Dr Milligan, *op. cit.* p. 265 ff.; cf. Lindsay, p. 37.
itinerant evangelists, who hold simple missions, without charge, and distribute literature. Each van mission has a clerical “advisor.” Missions are also held in prisons and workhouses, at the invitation of the authorities. In 1888 (before the similar work of the Salvation Army was inaugurated) the Church Army established labour homes in London and elsewhere, with the object of giving a “fresh start in life” to the outcast and destitute. These homes deal with the outcast and destitute in a plain, straightforward way. They demand that the persons should show a desire for amendment; they subject them to firm discipline, and give them hard work; they give them decent clothes, and strive to win them to a Christian life. The inmates earn their board and lodging by piece-work, for which they are paid at the current trade rates, while by a gradually lessening scale of work and pay they are stimulated to obtain situations for themselves and given time to seek for them. There are about 120 homes in London and the provinces, and 56% of the inmates are found to make these the successful beginning of an honest self-supporting life. The Church Army has lodging homes, employment bureaux, cheap food depots, old clothes department, dispensary and a number of other social works. Every winter employment is found for a great number of the unemployed in special depots, among them being the King’s Labour Tents and the Queen’s Labour Relief Depots. There is also an extensive emigration system, under which many hundreds (3000 in 1906) of carefully tested men and families, of good character, chiefly of the employed class, are placed in permanent employment in Canada through the agency of the local clergy. The whole of the work is done in loyal subordination to the diocesan and parochial organization of the Church of England.

See Edgar Rowan, Wilson Carville and the Church Army.

CHURCH CONGRESS, an annual meeting of members of the Church of England, lay and clerical, to discuss matters religious, moral or social, in which the church is interested. It has no legislative authority, and there is nothing on the questions discussed. The first congress was held in 1848 in the hall of King’s College, Cambridge, and was the outcome of the revival of convocation in 1852. The congress is under the presidency of the bishop in whose diocese it happens to be held. Recent places of meeting are Brighton (1901), Northampton (1902), Bristol (1903), Liverpool (1904), Weymouth (1905), Barrow-in-Furness (1906), Great Yarmouth (1907), Manchester (1908), Swansea (1909). The meetings of the congress have been mainly remarkable as illustrating the wide divergences of opinion and practice in the Church of England, no less than the broad spirit of tolerance which has made this possible and honourably differentiates these meetings from so many ecclesiastical assemblies of the past. The congress of 1908 was especially distinguished, not only for the expression of diametrically opposed views on such questions as the sacrifice of the mass or the “higher criticism,” but for the very large proportion of time given to the discussion of the attitude of the Church towards Scoletism and kindred subjects.

CHURCH HISTORY. The sketch given below of the evolution of the Christian Church (see CHURCH) may well be prefaced by a summary of the history of the great Church historians, concerning whom fuller details are given in separate articles. Hegesippus wrote in the 2nd century a collection of memoirs containing accounts of the early days of the church, only fragments of which are extant. The first real church history was written by Eusebius of Caesarea in the early part of the 4th century. His work was continued in the 5th century by Philostorgius, Socrates, Sozomen and Theodoret, and in later centuries by Theodorus Lector, Evagrius, Theophanes and others. In the 14th century Nicephorus Callistus undertook a complete church history which covers in its extant form the first six centuries. In the West Eusebius’ History was translated into Latin by Rufinus, and continued down to the end of the 4th century. Augustine’s City of God, published in 426, was an apologetic, not an historical work, but it had great influence in our field, for in it he undertake to answer the common heathen accusation that the growing misfortunes of the empire were due to the prevalence of Christianity and the forsaking of the gods of Rome. It was to sustain Augustine’s thesis that Orosius produced in 417 his Historiarum libri septem, which remained the standard textbook on world history during the middle ages. About the same time Sulpicius Severus wrote his Historia Sacra, covering both biblical and Christian history. In the 6th century Cassiodorus had a translation made of the histories of Socrates, Sozomen and Theodoret, which were woven into one continuous narrative and brought down to 518. The work was known as the Historia Ecclesiastica Tripartita, and constituted during the middle ages the principal textbook of church history in the West. Before writing his history Eusebius produced a world chronicle which was based upon a similar work by Julius Africanus and is now extant only in part. It was continued by Jerome, and became the basis of the model for many similar works of the 5th and following centuries by Prosper, Idatius, Marcellinus Comes, Victor Tununensis and others. Local histories containing more or less ecclesiastical material were written in the 6th and following centuries by Jordanes (History of the Goths), Gregory of Tours (History of the Franks), Isidore of Seville (History of the Goths, Vandals and Swets), Bede (Ecclesiastical History of England), Paulus Diaconus (History of the Lombards), and others. Of the many historians of the middle ages, besides the authors of biographies, chronicles, cloister annals, &c., may be mentioned Haymo, Anastasius, Adam of Bremen, Ordericus Vitalis, Honorius of Autun, Otto of Freising, Vincent of Beauvais and Antoninus of Florence.

The Protestant reformation resulted in a new development of historical writing. Polemic interest led a number of Lutheran scholars of the 16th century to publish the Magdeburg Centuries (1559 ff.), in which they undertook to show the primitive character of the Protestant faith in contrast with the alleged corruptions of Roman Catholicism. In this design they were followed by many other writers. The opposite thesis was maintained by Baronius (Annales Ecclesiastici, 1588 ff.), whose work was continued by a number of Roman Catholic scholars. Other notable Roman Catholic historians of the 17th and 18th centuries were Natalis Alexander, Bossuet, Tilmont, Fleury, Dupin and Cellier.

Church history began to be written in a genuinely scientific spirit only in the 18th century under the leadership of Mosheim, who is commonly called the father of modern church history. With wide learning and keen critical insight he wrote a number of historical works of which the most important is his Institutiones Hist. Eccles. (1755; best English trans. by Murdock). He was followed by many disciples, among them Schroech (Christliche Kirchengeschichte, 1772 ff. in 45 vols.). Other notable names of the 18th century are Semler, Spittler, Henke and Planck.

The new historical spirit of the 19th century did much for church history. Among the greatest works produced were those of J. C. L. Gieseler (Loburhch der Kirchengeschichte, 1824 ff., best Eng. tr. revised and edited by H. B. Smith), exceedingly objective in character and still valuable, particularly on account of its copious citations from the sources; Neander (Allgemeine Geschichte der christlichen Religion und Kirche, 1825 ff., Eng. tr. by Torrey), who wrote in a similar spirit, with especial stress upon the religious side of the subject, and has been followed by many disciples, for instance, Hagenbach, Schaff and Herzog; and Baur (Das Christenthum und die christliche Kirche, 1853 ff.), the most brilliant of all, whose many historical works were dominated by the principles of the Hegelian philosophy and evinced both the merits and defects of that school. Baur has had tremendous influence, even though many of his positions have been generally discredited. The problems particularly of the primitive history were first brought into clear light by him, and all subsequent work upon the subject must acknowledge its indebtedness to him.

A new era was opened by the publication in 1857 of the second edition of Ritschli’s Entstehung der althochkatholischen Kirche, in which he broke away from the Tübingen school and introduced new points of view that have revolutionized the interpretation of the early church. Of recent works the most important are the Kirchengeschichte of Carl Müller (1892 ff.) and that of W. Müller (1899 ff., second edition by von Schubert, 1868 ff.,
greatly enlarged and improved), the translation of the latter (1892 ff.) being the most useful text-book in English. Of modern Roman Catholic works may be mentioned those by J. A. Möhler, T. B. Alzog, F. X. Kraus, Cardinal Joseph von Hergenröther and C. J. von Hefele (edited by Knöpler).

In addition to these general works on church history should be named the histories of doctrine by Harnack, Loofs, Seeberg and Fisher; and on the early Church the works on the apostolic age by Weiszäcker (1886, English translation 1894), McGiffert (1897), and Bartlet (1899); Renan’s Histoire des origines du christianisme (1867 ff., in 7 vols., translated in part); Pfeiderer’s Urchristentum (1887); S. Cheetham’s History of the Christian Church during the first Six Centuries (1894); Wernle’s Anfänge unserer Religion (1901; Eng. tr. 1902 ff.); Rainy’s Ancient Catholic Church (1902); Knopf’s Nachapostolisches Zeitalter (1903); Duchesne’s Histoire ancienne de l’Église (vol. i., 1906).

A. THE ANCIENT CHURCH

1. Origin and Growth.—The crucifixion of Jesus Christ resulted in the scattering of his followers, but within a short time they became convinced that he had risen from the dead, and would soon return to set up the expected Messianic kingdom, and so to accomplish the true work of the Messiah (cf. Acts i. 6 ff.). They were thus enabled to retain the belief in his Messiahship which his death had threatened to destroy permanently. This belief laid upon them the responsibility of bringing as many of their countrymen as possible to recognize him as Messiah, and to prepare themselves by repentance and righteousness for the coming kingdom (cf. Acts ii. 21, 38, iii. 19 sq.). It was with the sense of this responsibility that they gathered again in Jerusalem, the political and religious metropolis of Judaism. In Jerusalem the new movement had its centre, and the church established there is rightly known as the mother church of Christendom. The life of the early Jewish disciples, so far as we are able to judge from our meagre sources, was very much the same as that of their fellows. They continued faithful to the established synagogue and temple worship (cf. Acts iii. 1), and did not think of founding a new sect, or of separating from the household of Israel (cf. Acts x. 14, xv. 5, xxi. 21 sq.). There is no evidence that their religious or ethical ideals differed in any marked degree from those of the more serious-minded among their countrymen, for the emphasis which they laid upon the need of righteousness was not at all uncommon. In their belief, however, in the Messiahship of Jesus, and their consequent assurance of the speedy establishment by him of the Messianic kingdom, they stood alone. The first need of the hour, therefore, was to show that Jesus was the promised Messiah in spite of his crucifixion, a need that was met chiefly by testimony to the resurrection, which became the burden of the message of the early disciples to their fellow-countrymen (cf. Acts ii. 24 ff., iii. 15 ff., v. 31). It was this need which led also to the development of Messianic prophecy and the ultimate interpretation of the Jewish Bible as a Christian book (see STATE). The second need of the hour was to bring the nation to repentance and righteousness in order that the kingdom might come (cf. Acts iii. 19). The specific gospel of Jesus, the gospel of divine fatherhood and human brotherhood, received no attention in the earliest days, so far as our sources enable us to judge. Meanwhile the new movement spread quite naturally beyond the confines of Palestine and found adherents among the Jews of the dispersion, and at an early day among the Gentiles as well. Many of the latter had already come under the influence of Judaism, and were more or less completely in sympathy with Jewish religious principles. Among the Christians who did most to spread the gospel in the Gentile world was the apostle Paul, whose conversion was the greatest event in the history of the early Church. In his hands Christianity became a new religion, fitted to meet the needs of all the world, and freed entirely of its local and national meaning which had hitherto attached to it. According to the early disciples Jesus was the Jewish Messiah, and had significance only in relation to the expected Messianic kingdom. To establish that kingdom was his one great aim. For the Gentiles he had no message except as they might become members of the family of Israel, assuming the responsibilities and enjoying the privileges of proselytes. But Paul saw in Jesus much more than the Jewish Messiah. He saw in Christ the divine Spirit, who had come down from heaven to transform the lives of men, all of whom are sinners. Thus Jesus had the same significance for one man as for another, and Christianity was meant as much for Gentiles as for Jews. The kingdom of which the early disciples were talking was interpreted by Paul as righteousness and peace and joy in the Holy Ghost (Rom. xiv. 17), a new principle of living, not a Jewish state. But Paul taught also, on the basis of a religious experience and of a distinct theory of redemption (see McGiffert’s Apostolic Age, ch. iii.), that the Christian is freed from the obligation to observe the Jewish law. He thus did away with the most fundamental distinction between Jews and Gentiles. The transformed spiritual life of the believer expresses itself not in the observance of the Jewish law, but in love, purity and peace. This precipitated a very serious conflict, of which we learn something from the Epistle to the Galatians and the Book of Acts (xxv. and xxvi.). Other fundamental principles of Paul’s failed of comprehension and acceptance, but the belief finally prevailed that the observance of Jewish law and custom was unnecessary, and that the Christian Church is distinct in all these and the uncircumcised. Those Jewish Christians who refused to go with the rest of the Church in this matter lived their separate life, and were regarded as an heretical sect known as the Ebionites.

It was Christianity in its universal form which won its great victories, and finally became permanently established in the Roman world. The appeal which it made to that world was many-sided. It was a time of moral reformation, when men were awaking to the need of better and purer living. To all who felt this need Christianity offered high moral ideals, and a tremendous moral enthusiasm, in its devotion to a beloved leader, in its emphasis upon the ethical possibilities of the meanest, and in its faith in a future life of blessedness for the righteous. It was a time of great religious interest, when old cults were being revived and new ones were finding acceptance on all sides. Christianity, with its one God, and its promise of redemption and a blessed immortality based upon divine revelation, met as no other contemporary faith did the awakening religious needs. It was a time also of great social unrest. With its principle of Christian brotherhood, its emphasis upon the equality of all believers in the sight of God, and its preaching of a new social order to be set up at the return of Christ, it appealed strongly to multitudes, particularly of the poorer classes. That it won a permanent success, and finally took possession of the Roman world, was due to its combination of appeals. No one thing about it commended it to all, and to no one thing alone did it owe its victory, but to the fact that it met a greater variety of needs and met them more satisfactorily than any other movement of the age. Contributing to this was the fact that the growth of the Church was the zool of its converts, that the great majority of whom regarded themselves as missionaries and did what they could to extend the new faith. Christianity was essentially a proselytizing religion, not content to appeal simply to one class or race of people, and to be one among many faiths, but believing in the falsity or insufficiency of all others and eager to convert the whole world. Moreover, the feeling of unity which bound Christians everywhere together and made of them one compact whole, and which found expression before many generations had passed in a strong organization, did much for the spread of the Church. Identifying himself with the Christian circle from the 2nd century on, a man became a member of a society existing in all quarters of the empire, every part conscious of its oneness with the larger whole and all compactly organized to do the common work. The growth of the Church during the
The early Christians was their vivid sense of being a people of God, called and set apart. The Christian Church in their thought was a divine, not a human, institution. It was founded and controlled by God, and even the world was created for its sake (cf. the Shepherd of Hermas, Vss. ii. 4, and 2 Clement 14). This conception, which came over from Judaism, controlled all the life of the early Christians both individual and social. They regarded themselves as separate from the rest of the world and bound together by peculiar ties. Their citizenship was in heaven, not on earth (cf. Phil. iii. 20, and the epistle to Diognetus, c. 5), and the principles and laws by which they strove to govern themselves were from above. The present world was but temporary, and their true life was in the future. Christ was soon to return, and the employments and labours and pleasures of this age were of small concern. Some went so far as to give up their accustomed vocations, and with such Paul had to exhort in his epistles to the Thessalonians. A more or less ascetic mode of life was also natural under the circumstances. Not necessarily that the present world was evil, but that it was temporary and of small worth, and that a Christian's heart should be set on higher things. The belief that the Church was a supernatural institution found expression in the Jewish notion of the power and presence of the Holy Spirit. It was believed among the Jews that the Messianic age would be the age of the Spirit in a marked degree, and this belief passed over into the Christian Church and controlled its thought and life for some generations. The Holy Spirit was supposed to be manifest in various striking ways, in prophecy, speaking with tongues and miracle working. In this idea Paul also shared, but he carried the matter farther than most of his contemporaries and saw in the Spirit the abiding power and ground of the Christian life. Not simply in extraordinary phenomena, but also in the everyday life of Christians, the Holy Spirit was present, and all the Christian graces were the fruits (cf. Gal. v. 22). A result of this belief was to give their lives a peculiarly enthusiastic or inspirational character. Thiers were not the everyday experiences of ordinary men, but of men lifted out of themselves and transported into a higher sphere. With the passing of time the early enthusiasm waned, the expectation of the immediate return of Christ was widely given up, the conviction of the Spirit's presence became less vivid, and the conflict with heresy in the 2nd century led to the substitution of official control for the original freedom (see below). The late 2nd century movement known as Montanism was in essence a revolt against this growing secularization of the Church, but the movement failed, and the development against which it protested was only hastened. The Church as an institution now looked forward to a long life upon earth and adjusted itself to the new situation, taking on largely the forms and customs of the world in which it lived. This did not mean that the Church ceased to regard itself as a supernatural institution, but only that its supernatural character was shown in a different way. A Christian was still dependent upon divine aid for salvation, and his life was still supernatural at least in theory. Indeed, the early conviction of the essential difference between the life of this world and that of the Super natural world, which the Church became increasingly a world-institution, found vent in monasticism, which was simply the effort to put into more consistent practice the other-worldly life, and to make more thoroughgoing work of the saving of one's soul. Contributing to the same result was the emphasis upon the necessity of personal purity or holiness, which Paul's contrast between flesh and spirit had promoted, and which easily took the supreme place given by Christ to love and service. The growing difficulty of realizing the ascetic ideal in the midst of the world, and within the world-church, inevitably drove multitudes of those who took their religion seriously to retire from society and to seek salvation and the higher life, either in solitude, or in company with kindred spirits.

There were Christian monks as early as the 3rd century, and before the end of the 4th monasticism (q.v.) was an established institution both in East and West. The monks and nuns were looked upon as the most consistent Christians, and were honoured accordingly. Those who did not adopt the monastic life

1 Upon the spread of the Church during the early centuries see especially Harnack's Mission und Ausbreitung des Christentums in den ersten drei Jahrhunderten. An interesting parallel to the spread of Christianity in the Roman empire is afforded by the contemporary Mithraism. See Cumont's Les Mystères de Mithra (1900), Eng. tr. The Mysteries of Mithra (1903).
endevoured on a lower plane and in a less perfect way to realize the common ideal, and by means of penance to atone for the deficiencies in their performance. The existence of monasticism made it possible at once to hold up a high moral standard before the world and to permit the ordinary Christian to lead something lower. With the growth of clerical sacerdotalism the higher standard was demanded also of the clergy, and the principle came to be generally recognized that they should live the monastic life so far as was consistent with their active duties in the world. The chief manifestation of this was clerical celibacy, which had become widespread already in the 4th century. Among the laity, on the other hand, the ideal of holiness found realization in the observance of the ordinary principles of morality recognized by the world at large, in attendance upon the means of grace provided by the Church, in fasting at stated intervals, in eschewing various popular employments and amusements, and in almsgiving and prayer. Christ's principle of love was widely interpreted to mean chiefly love for the Christian brotherhood, and within that circle the virtues of hospitality, charity and helpfulness were widely exercised; and if the salvation of his own soul was regarded as the most important affair of every man, the service of the brethren was recognized as an imperative Christian duty. The fulfilling of that duty was one of the most beautiful features of the life of the early Church, and it did perhaps more than anything else to make the Christian circle attractive.

3. Worship.—The primitive belief in the immediate presence of the Spirit affected the religious services of the Church. They were regarded in early days as occasions for the free exercise of spiritual gifts. As a consequence the complete liberty was accorded to all Christians to take such part as they chose, it being assumed that they did so only under the Spirit's prompting. But the result of this freedom was confusion and discord, as is indicated by Paul's First Epistle to the Corinthians (see chapters xi., xiv.). This led to the erection of safeguards, which should prevent the continuance of the unseemly conditions (on Paul's action in the matter, see McGiffert's Apostolic Age, p. 523). Particular Christians were designated to take charge of the services, and orders of worship were framed out of which grew ultimately elaborate liturgies (see Liturgy). The Lord's Supper first took on a more stereotyped character, and prayers to be used in connexion with it are found already in the Didache (chapters ix. and x.). The development cannot be traced in detail. It may simply be said that the general tendency was on the one hand toward the elaboration and growing magnificence of the services, especially after the Church had become a state institution, and on the other toward increasing solemnity and dignity. In certain parts, particularly the eucharist, the sacred character of which was such as to make its sacriligious to admit to it the unholy, that is, outsiders or Christians under discipline (cf. Didache, ix.). It was, in fact, from the Lord's table that offending disciples were first excluded. Out of this grew up in the 3rd or 4th century what is known as the arcana disciplina, or secret discipline of the Church, involving the concealment from the uninitiated and unholy of the more sacred parts of the Christian cult, such as baptism and the eucharist, with their various accompaniments, including the Creed and the Lord's Prayer. The same interest led to the division of the services into two general parts, which became known ultimately as the missa catechumenorum and the missa fideliorem,—that is, the more public service of prayer, praise and preaching open to all, including the catechumens or candidates for Church membership, and the private service for the administration of the eucharist, open only to full members of the Church in good and regular standing. Meanwhile, as the general service tended to grow more elaborate, the missa fideliorem tended to take on the character of the current Greek mysteries (see Eucharist; Hatch, Influence of Greek Ideas and Usages upon the Christian Church, 1809: Anich, Das antike Mysterienwesen in seinem Einfluss auf das Christentum, 1894: Wobbermin, Religionsgeschichtliche Studien zur Frage der Beeinflussung des Urchristentums durch das antike Mysterienwesen, 1896). Many of the terms in common use in them were employed in connexion with the Christian rites, and many of the conceptions, particularly that of sharing in immortality by communion with deity, became an essential part of Christian doctrine. Thus the early idea of the services as occasions for mutual edification through the interchange of spiritual gifts, gave way in course of time to the theory that they consisted of sacred and mysterious rites by means of which communion with God is promoted. The emphasis accordingly came to be laid increasingly upon the formal side of worship, and a value was given to the ceremonies as such, and their proper and correct performance by duly qualified persons, i.e. ordained priests, was made the all-important thing.

4. The Church and the Sacraments.—According to Paul, man is flesh and so subject to death. Only as he becomes a spiritual being through mystical union with Christ can he escape death and enjoy eternal life in the spiritual realm. In the Epistle to the Ephesians the Christian Church is spoken of as the body of Christ (iv. 12 ff., v. 30); and Ignatius, bishop of Antioch, early in the 2nd century, combined the two ideas of union with Christ, as the necessary condition of salvation, and of the Church as the body of Christ, teaching that no one could be saved unless he were a member of the Church (cf. his Epistle to the Ephesians 4, 5, 15; Trall. 7; Phil. 3,8; Smyr. 8; Magn. 2, 7). Traces of the same idea are found in Irenaeus (cf. Adv. Haer. iii. 24, 1, iv. 26, 2), but it is first clearly set forth by Cyprian, and received from him its classical expression in the famous sentence "Salus extra ecclesiam non est." (Ep. 73, 21; cf. also Ep. 4, 4; 74, 7; and De unitate ecclesiae, 6: "habere non potest Deum patrem qui ecclesiam non habet matrem"). The Church thus became the sole ark of salvation, outside of which no one could be saved. Intimately connected with the idea of the Church as an ark of salvation are the sacraments or means of grace. Already as early as the 2nd century the rite of baptism had come to be thought of as the sacrament of regeneration, by means of which a new divine nature is born within a man (cf. Irenaeus, Adv. Haer. i. 21, 1, iii. 17, 1; and his newly discovered Demonstration of the Apostolic Teaching, chap. 3), and the eucharist as the sacrament of the body and blood of Christ, feeding upon which one is endowed with immortality (cf. Irenaeus, Adv. Haer. iv. 18, 5, v. 2, 2). In the early days the Church was thought of as a community of saints, all of whose members were holy, and as a consequence discipline was strict, and offenders excluded from the Church were commonly not readmitted to membership but left to the mercy of God. The idea thus became general that baptism, which had been almost from the beginning the rite of entrance into the Church, and which secured the forgiveness of all pre-baptismal sins, should be given but once to any individual. Meanwhile, however, discipline grew less strict (cf. the Shepherd of Hermas, Vis. v. 3; M. iv. 7; Sim. viii. 6, ix. 19, 26, &c.); until finally, under the influence of the idea of the Church as the sole ark of salvation, it became the custom to readmit all penitent offenders on condition that they did adequate penance. Thus there grew up the sacrament of penance, which secured for those already baptized the forgiveness of post-baptismal sins. This sacrament, unlike baptism, might be continually repeated (see Penance). In connexion with the sacraments grew up also the theory of clerical sacerdotalism. Ignatius had denied the validity of a eucharist administered independently of the bishop, and the principle finally established itself that the sacraments, with an exception in cases of emergency in favour of baptism, could be performed only by men regularly ordained and so endowed with the requisite divine grace for their due administration (cf. Tertullian, De Exhort. cast. 7; De Bapt. 7, 17; De Praeceptis Hærum, 41; and Cyprian, Ep. 67. For the later influence of the Donatist controversy upon the sacramental development, and which was regarded as distinguished from the laity became true priests, and the latter were made wholly dependent upon the former for sacramental grace, without which there is ordinarily no salvation (see Order, Holy).

5. Christian Doctrine.—Two tendencies appeared in the thought
of the primitive Church, the one to regard Christianity as a law given by God for the government of men's lives, with the promise of a blessed immortality as a reward for its observance; the other to view it as a means by which the corrupt and mortal nature of man is transformed, so that he becomes a spiritual and holy being. The latter tendency appeared first in Paul, afterwards in the Gospel and First Epistle of John, in Ignatius of Antioch and in the Gnostics. The former found expression in most of our New Testament writings, in all of the apostolic fathers except Ignatius, and in the Apologists of the 2nd century. The two tendencies were not always mutually exclusive, but the one or the other was predominant in every case. Towards the end of the 2nd century they were combined by Irenaeus, bishop of Lyons. To him salvation bears a double aspect, involving both release from the control of the devil and the transformation of man's nature by the indwelling of the Divine. Only he is saved who on the one hand is forgiven at baptism and so released from the power of Satan, and then goes on to live in obedience to the divine law; and on the other hand receives in baptism the germ of a new spiritual nature and is progressively transformed by feeding upon the body and blood of the Divine Body. This double conception of salvation and of the means thereto was handed down to the Church of subsequent generations and became fundamental in its thought. Christianity is at once a revealed law which a man must keep, and by keeping which he earns salvation, and a supernatural power whereby his nature is transformed and the divine quality of immortality imparted to it. From both points of view Christianity is a supernatural system without which salvation is impossible, and in the Christian Church it is preserved and mediated to the world.

The twofold conception referred to had its influence also upon thought about Christ. The effect of the legal view of Christianity was to make Christ an agent of God in the revelation of the divine will and truth, and so a subordinate being between God and the world, the Logos of current Greek thought. The effect of the mystical conception was to identify Christ with God in order that by his incarnation the divine nature might be brought into union with humanity and the latter be transformed. In this case too a combination was effected, the idea of Christ as the incarnation of the Logos or Son of God being retained and yet his deity being preserved by the assertion of the deity of the Logos. The recognition of Christ as the incarnation of the Logos was practically universal before the close of the 3rd century, but his deity was still widely denied, and the Arian controversy which distracted the Church of the 4th century concerned the latter question. At the council of Nicaea in 325 the deity of Christ received official sanction and was given formulation in the original Nicene Creed. Controversy continued for some time, but finally the Nicene decision was recognized both in East and West as the only orthodox faith. The deity of the Son was believed to carry with it that of the Spirit, who was associated with Father and Son in the baptismal formula and in the current symbols, and so the victory of the Nicene Christology meant the recognition of the doctrine of the Trinity as a part of the orthodox faith (see especially the writings of the Cappadocian fathers, the late 4th century, Gregory of Nyssa, Basil and Gregory Nazianzen).

The assertion of the deity of the Son incarnate in Christ raised another problem which constituted the subject of dispute in the Christological controversies of the 4th and following centuries. What is the relation of the divine and human natures in Christ? At the council of Chalcedon in 451 it was declared that in the person of Christ are united two complete natures, divine and human, which retain after the union all their properties unchanged. This was supplemented at the third council of Constantinople in 680 by the statement that each of the natures contains a will, so that Christ possesses two wills. The Western Church accepted the decisions of Nicaea, Chalcedon and Constantinople, and so the doctrines of the Trinity and of the two natures in Christ were handed down as orthodox dogma in West as well as East.

Meanwhile in the Western Church the subject of sin and grace, and the relation of divine and human activity in salvation, received especial attention; and finally, at the second council of Orange in 529, after both Pelagianism and semi-Pelagianism had been repudiated, a moderate form of Augustinianism was adopted, involving the theory that every man as a result of the fall is in such a condition that he can take no steps in the direction of salvation until he has been renewed by the divine grace given in baptism, and that he cannot continue in the good thus begun except by the constant assistance of that grace, which is mediated only by the Catholic Church. This decision was confirmed by Pope Boniface II., and became the accepted doctrine in the Western Church of the middle ages. In the East, Augustine's predestinationism had little influence, but East and West were one in their belief that human nature had been corrupted by the fall, and that salvation therefore is possible only to one who has received divine grace through the sacraments. Agreeing as they did in this fundamental theory, all differences were of minor concern.

In general it may be said that the traditional theology of the Church took its material from various sources—Hebrew, Christian, Oriental, and Greek. The theological development and expression were principally those of Greek philosophy on the one hand and of Roman law on the other (see Christianity).

6. Organization.—The origin and early development of ecclesiastical organization are involved in obscurity. Owing to the once prevalent desire of the adherents of one or another polity to find support in primitive precept or practice, the question has assumed a prominence out of proportion to its real importance, and the few and scattered references in early Christian writings have been made the basis for various elaborate theories.

In the earliest days the Church was regarded as a divine institution, ruled not by men but by the Holy Spirit. At the same time it was believed that the Spirit imparted different gifts to different believers, and each gift fitted its recipient for the performance of some service, being intended not for his own good but for the good of his brethren (cf. 1 Cor. xii.; Eph. iv. 11).

The chief of these was the gift of teaching, that is, of understanding and interpreting to others the will and truth of God. Those who were endowed more largely than their fellows with this gift were commonly recognized as apostles, prophets and teachers (cf. Acts xiii. 1; 1 Cor. xii. 28; Eph. ii. 20, iii. 5, iv. 11; Didaché, xi.). The apostles were travelling missionaries or evangelists. There were many of them in the primitive Church, and only gradually did the term come to be applied exclusively to the twelve and Paul. There is no sign that the apostles, whether the twelve or others, held any official position in the Church. That they had a large measure of authority of course goes without saying, but it depended always upon their brethren's recognition of their possession of the divine gift of apostleship, and the right of Churches or individuals to test their claims and to refuse to listen to them if they did not vindicate their divine call was everywhere recognized. Witness, for instance, Paul's reference to false apostles in 2 Cor. xi. 13, and his efforts to establish his own apostolic character to the satisfaction of the Corinthians and Galatians (1 Cor. ix. 1 ff., 2 Cor. x. 23; Gal. i. 8 ff.); witness the reference in Rev. ii. 2 to the fact that the Twelve and Ephesus had tried certain men who claimed to be apostles and had found them false, and also the directions given in the Didaché for testing the character of those who travelled about as apostles. The passage in the Didaché is especially significant: "Concerning the apostles and prophets, so do ye according to the ordinance of the gospel. Let every apostle when he cometh to you be received as the Lord. But he shall not abide more than a single day, or if there be need a second likewise. But if he abide three days he is a false prophet. And when the apostle departeth let him receive nothing save bread until he findeth shelter. But if he ask money he is a false prophet." (ch. xi.). It is clear that a man who is to be treated in this way by the congregation is not an official ruler over it.

Between the apostles, prophets and teachers no hard-and-fast lines can be drawn. The apostles were commonly missionary
prophets, called permanently or temporarily to the special work of evangelization (cf. Acts xiii. 1; Did. xi.), while the teachers seem to have been distinguished both from apostles and prophets by the fact that their spiritual endowment was less strikingly supernatural. The indefiniteness of the boundaries between the three classes, and the free interchange of names, show how far they were from being definite offices or orders within the Church. Apostleship, prophecy and teaching were only functions, whose frequent or regular exercise by one or another, under the inspiration of the Spirit, led his brethren to call him an apostle, prophet or teacher.

But at an early day we find regular officers in this and that local Church, and early in the 2nd century the three permanent offices of bishop, presbyter and deacon existed at any rate in Asia Minor (cf. the Epistles of Ignatius of Antioch). Their rise was due principally to the necessity of administering the charities of the Church, putting an end to disorder and confusion in the religious services, and disciplining offenders. It was naturally to the apostles, prophets and teachers, its most spiritual men, that the Church looked first for direction and control in all these matters. But such men were not men at hand, or sometimes they were absorbed in other duties. Thus the need of substitutes began to be felt here and there, and as a consequence regular offices within the local Churches gradually made their appearance, sometimes simply recognized as charged with responsibilities which they had already voluntarily assumed (cf. 1 Cor. xvi. 13), sometimes appointed by an apostle or prophet or other specially inspired man (cf. Acts xiv. 23; Titus i. 5; 1 Clement 44), sometimes formally chosen by the congregation itself (cf. Acts vi., Did. xi.). These men naturally acquired more and more as time passed the control and leadership of the Church in all its activities, and out of what was in the beginning more or less informal and temporary grew fixed and permanent offices, the incumbents of which were recognized as having a right to rule over the Church, a right which once given could not lawfully be taken away unless they were unfaithful to their trust. Not continued endowment by the Spirit, but the possession of an ecclesiastical office now became the basis of authority. The earliest expression of this genuinely official principle is found in Clement's Epistle to the Corinthians, ch. xlv. Upon these officers devolved ultimately not only the disciplinary, financial and liturgical duties referred to, but also the still higher function of instructing their fellow-Christians in God's will and truth, and so they became the substitutes of the apostles, prophets and teachers in all respects (cf. 1 Tim. iii. 2; v. 17; Titus i. 9; Did. 15; 1 Clement 44; Justin's first Apology, 67).

Whether in the earlier days there was a single officer at the head of a congregation, or a plurality of officers of equal authority, it is a plurality to say with assurance. The few references which we have look in the latter direction (cf., for instance, Acts vi.; Phil. i. 7; 1 Clement 42, 44; Did. 14), but we are not justified in asserting that they represent the universal custom. The earliest distinct evidence of the organization of Churches under a single head is found in the Epistles of Ignatius of Antioch, written in the first part of the reign of Trajan (c. 116). Ignatius bears witness to the presence in various Churches of Asia Minor of a single bishop in control, with whom are associated as his subordinates a number of elders and deacons. This form of organization ultimately became universal, and already before the end of the 2nd century it was established in all the parts of Christendom with which we are acquainted, though in Egypt it seems to have been the exception rather than the rule, and even as late as the middle of the 3rd century many churches there were governed by a plurality of officers instead of by a single head (see Harnack, Mission und Ausbreitung des Christenthums, pp. 337 seq.). Where there were one bishop and a number of presbyters and deacons in a church, the presbyters constituted the bishop's council, and the deacons his assistants in the management of the finances and charities and in the conduct of the services. (Upon the minor orders which arose in the 3rd and following centuries, and became ultimately a training school for the higher clergy, see Harnack, Texte und Untersuchungen, ii. 5; English translation under the title of Sources of the Apostolic Canons, 1895).

Meanwhile the rise and rapid spread of Gnosticism produced a great crisis in the Church of the 2nd century, and profoundly affected the ecclesiastical organization. The views of the Gnostics, and of Marcion as well, seemed to the majority of Christians destructive of the gospel, and it was widely felt that they were too dangerous to be tolerated. The original dependence upon the Spirit for light and guidance was inadequate. The men in question claimed to be Christians and to enjoy divine illumination as truly as anybody, and so other safeguards appeared necessary. It was in the effort to find such safeguards that steps were taken which finally resulted in the institution known as the Catholic Church. The first of these steps was the recognition of the teaching of the apostles (that is, of the twelve and Paul) as the exclusive standard of Christian truth. This found expression in the formulation of an apostolic scripture canon, our New Testament, and of an apostolic rule of faith, of which the old Roman symbol, the original of our present Apostles' Creed, is one of the earliest examples. Over against the claims of the Gnostics that they had apostolic authority, either oral or written, for their preaching, were set these two standards, by which alone the apostolic character of any doctrine was to be tested (cf. Irenaeus, Adv. Haer. i. 10, iii. 3, 4; and Tertullian, De Prescriptione Haer. passion). But these standards proved inadequate to the emergency, for it was possible, especially by the use of the allegorical method, to interpret them in more than one way, and their apostolic origin and authority were not everywhere admitted. In view of this difficulty, it was claimed that the apostles had appointed the bishops as their successors, and that the latter were in possession of special divine grace enabling them to transmit and to interpret without error the teaching of the apostles committed to them. This is the famous theory known as "apostolic succession." The idea of the apostolic appointment of church officers is as old as Clement of Rome (see 1 Clement 44), but the use of the theory to guarantee the apostolic character of episcopal teaching was due to the exigencies of the Gnostic conflict. Irenaeus (Adv. Haer. iii. 3 ff., iv. 26, iv. 33, v. 20), Tertullian (De prescriptione 32), and Hippolytus (Philosophumena, bk. i., preface) are our earliest witnesses to it, and Cyprian sets it forth clearly in his epistles (e.g. Ep. 33, 43, 59, 66, 69). The Church was thus in possession not only of authoritative apostolic doctrine, but also of a permanent apostolic office, to which alone belonged the right to determine what that doctrine is. The combination of this idea with that of clerical sacerdotalism completed the Catholic theory of the Church and the clergy. Saving grace is recognized as apostolic grace, and the bishops as successors of the apostles become its sole transmitters. Bishops are therefore necessary to the very being of the Church, without which there is without the saving grace for the giving of which the Church exists (cf. Cyprian, Ep. 33, "ecclesia super episcopos constituitur"; 66, "ecclesia in episcopo est et in unitate eccles. 17"). The bishops were originally not diocesan, but congregational, that is, each church, not a definite individual, and his bishop. This is the organization testified to by Ignatius, and Cyprian's insistence upon the bishop as necessary to the very existence of the Church seems to imply the same thing. Congregational episcopacy was the rule for a number of generations. But after the middle of the 3rd century diocesan episcopacy began to make its appearance here and there, and became common in the 4th century under the influence of the general tendency toward centralization, the increasing power of city bishops, and the growing dignity of the episcopate (cf. canon 6 of the council of Sardica, and canon 57 of the council of Laodicea; and see Harnack, Mission und Ausbreitung, pp. 319 seq.). This enlargement of the bishop's parish and multiplication of the churches under his care led to a change in the functions of the presbyterate. So long as each church had its own bishop the presbyters constituted simply his council, but with the growth of diocesan episcopacy it became the custom to put each congregation under the care of a particular presbyter, who performed within it most of the pastoral duties
formerly discharged by the bishop himself. The presbyters, however, were not independent officers. They were only representatives of the bishop, and the churches over which they were Chris- ters of one part of his parish, so that the Cyriacan principle, that the bishop is necessary to the very being of the Church, held good of diocesan as well as of congregational episcopacy. The bishop alone possessed the right to ordain; through him alone could be derived the requisite clerical grace; and so the clergy like the laity were completely dependent upon him.

The growth of the diocesan principle promoted the unity of the churches gathered under a common head. But unity was carried much further than this, and finally resulted in at least a nominal consolidation of all the churches of Christendom into one whole. The belief in the unity of the entire Church had existed from the beginning. Though made up of widely scattered congregations, it was thought of as one body of Christ, one people of God. This ideal unity found expression in many ways. Intercommunication between the various Christian communities was very active. Christians upon a journey were always sure of a warm welcome and hospitable entertainment from their fellow-disciples. Messengers and letters were sent freely from one church to another. Missionaries and evangelists went continually from place to place. Documents of various kinds, including gospels and apostolic epistles, circulated widely. Thus in various ways the feeling of unity found expression, and the development of widely separated parts of Christendom conformed more or less closely to a common type. It was due to agencies such as these that the scattered churches did not go each its own way and become ultimately separate and diverse institutions. But this general unity became official, and expressed itself in organization, only with the rise of the conciliar and metropolitan systems. Already before the end of the 2nd century local synods were held in Asia Minor to deal with Montanism, and in the 3rd century provincial synods became common, and by the council of Nicaea (canon 5) it was decreed that they should be held twice every year in every province. Larger synods representing the churches of a number of contiguous provinces also met frequently; for instance, in the early 4th century at Elvira, Ancyra, Neo-Caesarea and Arles, the last representing the entire Western world. Such gatherings were especially common during the great doctrinal controversies of the 4th century. In 325 the first general or ecumenical council, representing theoretically the entire Christian Church, was held at Nicaea. Other councils of the first period now recognized as ecumenical by the Church both East and West are Constantinople I. (381), Ephesus (431), Chalcedon (451), Constantinople II. (553). All these were called by the emperor, and to their decisions he gave the force of law. Thus the character of the Church as a state institution voiced itself in them. (See Council.)

The theory referred to above, that the bishops are successors of the apostles, and as such the authoritative conservators and interpreters of apostolic truth, involves of course the recognition of the episcopate, and the assumption that all bishops are in communion and bear witness to the same body of doctrine. This assumption, however, was not always supported by the facts. Serious disagreements even on important matters developed frequently. As a result the ecumenical council came into existence especially for the purpose of settling disputed questions of doctrine, and giving to the collective episcopate the opportunity to express its voice in a final and official way. At the council of Nicaea, and at the ecumenical councils which followed, the idea of an infallible episcopate giving authoritative and permanent utterance to apostolic and therefore divine truth, found clear expression, and has been handed down as a part of the faith of the Catholic Church both East and West. The infallibility of the episcopate guarantees the infallibility of a general council in which not the laity and not the clergy in general, but the bishops as successors of the apostles, speak officially and collectively.

Another organized expression of the unity of the Church was found in the metropolitan system, or the grouping of the churches of a province under a single head, who was usually the bishop of the capital city, and was known as the metropolitan bishop. The Church thus followed in its organization the political divisions of the Empire (cf. for instance canon 12 of the council of Chalcedon, which forbids more than one metropolitan see in a province; also canon 17 of the same council: “And if any city has been or shall hereafter be newly erected by imperial authority, let the arrangement of ecclesiastical parishes follow the political and municipal forms”). These metropolitan bishops were common in the East before the end of the 3rd century, and the general existence of the organization was taken for granted by the council of Nicaea (see canons 4, 6, 7). In the West, on the other hand, the development was much slower.

Meanwhile the tendency which gave rise to the metropolitan system resulted in the grouping together of the churches of a number of contiguous provinces under the headship of the bishop of the most important city of the district, as, for instance, Antioch, Ephesus, Alexandria, Rome, Milan, Carthage, Arles. In canon 6 of the council of Nicaea the jurisdiction of the bishops of Alexandria, Rome and Antioch is recognized. At the council of Constantinople (381) the bishop of Constantinople or New Rome was ranked next after the bishop of Rome (canon 3), and at the council of Chalcedon (451) he was given authority over the churches of the political dioceses of Pontus, Asia and Thrace (canon 38). To the bishops of Rome, Constantinople, Antioch and Alexandria was added at the council of Chalcedon (session 7) the bishop of Jerusalem, the mother church of Christendom, and the bishops thus recognized as possessing supreme jurisdiction were finally known as patriarchs.

Meanwhile the Roman episcopate developed into the papacy, which claimed supremacy over the entire Christian Church, and actually exercised it increasingly in the West from the 5th century on. This development was forwarded by Augustine, who in his famous work De civitate Dei identified the Church with the kingdom of God, and claimed that it was supreme over all the nations of the earth, which make up the civitas terrena or earthly state. Augustine’s theory was ultimately accepted everywhere in the West, and thus the Church of the middle ages was regarded not only as the ark of salvation, but also as the ultimate authority, moral, intellectual and political. Upon this doctrine was built, not by Augustine himself but by others who came after him, the structure of the papacy, the bishop of Rome being finally recognized as the head under Christ of the civilis Dei, and so the supreme organ of divine authority on earth (see Papacy and Pope).

Historical Sources of the First Period.—These are of the same general character for Church history as for general history—on the one hand monumental, on the other hand documentary. Among the monuments are churches, catacombs, tombs and inscriptions of various kinds, and considerable interest and value is due to the knowledge gained from documentary sources (see De Rossi, Roma soterranea, 1864 ff., and its English abridgment by Northcote and Brownlow, 1870; André Pératé, L’Archéologie chrétienne, 2 vols., 1852; W. Lowe, Monuments of the Early Church, 1901, with good bibliography). The documents comprise imperial edicts, rescripts, &c., liturgies, acts of councils, decreets and letters of bishops, references in contemporary heathen writings, and above all the Bible, the Writings of the Church Fathers and Monuments of the Early Church. The remaining centuries are relatively few, comprising, in addition to some scattered allusions by outsiders, the New Testament, the Apostolic Fathers, the Greek Apologists, Clement of Alexandria, the old Catholic Fathers (Irenaeus, Tertullian, and Hippolytus), and a few monuments of the first centuries. For the 3rd, and especially the 4th and following centuries, the writers are much more numerous; for instance, in the East, Origen and his disciples, and later Eusebius of Caesarea, Athanasius, Apollinaris, Basil, and the two Gregorys, Cyril of Jerusalem, Eusebius of Caesarea, Pseudo-Dionysius, and a few others. For the 5th, 6th, and 7th centuries, the material is much more abundant. For the 8th, 9th, and 10th centuries, the material is much more abundant. Among them are many works of the Fathers in the original, the most convenient, in spite of its defects, being that of J. P. Migne (Patrologia Graeca, 106 vols., Paris, 1857 ff.; Patrologia Latina, 221 vols., 1844 ff.). Of modern critical editions, besides those containing the works of one or another individual, the best are the Berlin edition of the early Greek Fathers (Die griechischen kirchlichen Schrifsteller der ersten drei Jahrhunderte, 1897 ff.), and the
The ancient Church was the church of the Roman empire. It is true that from the 4th century onwards it expanded beyond the borders of that empire to east and west, north and south, but the infant church which gradually took in Persia and Arabia, among some of the scattered Teutonic races, and among the Celts of Ireland, were at first not co-operating factors in the development of Christendom: they received without giving in return. True historic life is only to be found within the church of the Empire.

The middle ages came into being at the time when the political structure of the world, based upon the conquests of Alexander the Great and the achievements of Julius Caesar, began to disintegrate. They were present when the believers in Mahomet held sway in the Asiatic and African provinces which Alexander had once brought under the intellectual influence of Hellenism; while the Lombards, the West Goths, the Franks and the Anglo-Saxons had established kingdoms in Italy, Spain, Gaul and Britain. The question is: what was the position of the Church in this great change of circumstances, and what form did the Church’s development take from this time onwards? In answering this question we must consider East and West separately; for their histories are no longer coincident, as they had been in the time of the Roman dominion.

I. THE EAST. (a) The Orthodox Church.—Ancient and medieval times were not separated by so deep a gulf in the East as in the West; for in the East the Empire continued to exist, although within narrow limits, until towards the end of the middle ages. Constantinople only fell in 1453. Ecclesiastical Byzantinism is therefore not a product of the middle ages: it is the outcome of the development of the eastern half of the empire from the time of Constantine the Great. Under Justinian I. all its essential features were already formed: imperial power extended equally over State and Church; indeed, care for the preservation of dogma and for the purity of the priesthood was the chief duty of the ruler. To fulfil this duty was to serve the interests of both State and people; for thus ‘a fine harmony is established, and whatever good exists becomes the portion of the whole human race.’ Since the emperor ruled the Church there was no longer any question of independence for the bishops, least of all for the patriarch of Constantinople; they were in every respect subordinate to the emperor.

The orthodoxy of the Eastern Church was also a result of the Church’s development after the time of Constantine. In the long strife over dogma the old belief of the Greeks in the value of knowledge had made itself felt, and this faith was not extinct in the Eastern Church. There is no doubt that in the beginning of the middle ages both general and theological education stood higher among the Greeks than in more western countries. In the West there were no learned men who could vie with Photius (ca. 860-891) in range of knowledge and variety of scientific attainment. But the struggle over dogma came to an end with the 7th century. After the termination of the monothelite controversy (638-680), creed and doctrines were complete; it was only necessary to preserve them intact. Theology, therefore, now resolved itself into the collection and reproduction of the teaching of ancient authorities. The great dogmatist of the Eastern Church, John of Damascus (ca. 699-753), who stood on the threshold of the middle ages, formulated clearly and precisely the doctrine of the Greek Church for his working principle: to put forward nothing of his own, but to present the truth according to the authority of the Bible and of the Fathers of the Church. Later teachers, Euthymius Zigadenus (d. circa 1120), Nicetas Choniates (d. circa 1200), and others, proceeded further on the same lines; Euthymius, in particular, often uses an excerpt instead of giving his own exposition.

This attitude towards dogma did not mean that it was less prized than during the period of strife. On the contrary, the sacred formulae were revered because they were believed to contain the determination of the highest truths: the knowledge of God and of the mystery of salvation. Yet it is intelligible that religious interest should have concerned itself more keenly with the mystic rites of divine worship than with dogma. Here was more than knowledge; here were representations of a mystic sensuousness, solemn rites, which brought the faithful into immediate contact with the Divine, and guaranteed to them the reception of heavenly powers. What could be of more importance than to be absorbed in this transcendental world? We may gauge the extent to which men were ready to go in this direction if we call to mind that the controversy about dogma was replaced by the controversy about images. This raged in the Eastern Church for more than a century (726-843), and only sank to rest when the worship of images was unconditionally conceded. In this connexion the image was not looked upon merely as a symbol, but as the vehicle of the presence and power of that which it represented: in the image the invisible becomes operative in the visible world. Christ did not seem to be Christ unless he were visibly represented. What an ancient teacher had said with regard to the worship of Christ as the revelation of the Eternal Father—‘Honours paid to the earthly representative are shared by the heavenly Archetype’—was now transferred to the painted image: it appeared as an analogy to the Incarnation. It was for this reason that the victory of image worship was celebrated by the introduction of the festival of the Orthodox Faith on 11 February.

It is consistent with this circle of ideas that initiation into the profound mysteries of the liturgy was regarded, together with the preservation of dogma, as the most exalted function of theology. A beginning had been made, in the 5th century, by the neoplatonic Christian who addressed his contemporaries under the mask of Dionysius the Areopagite. He is the first of a series of mystical theologists which continued through every century of the middle ages. Maximus Confessor, the heroic defender of Dyotheletism (d. 662), Symeon, the New Theologian (d. circa 1040), Nicolas Cabasilas (d. 1372), and Symeon, like Nicholas, archbishop of Thessalonica (d. 1429), were the most conspicuous representatives of this Oriental mysticism. They left all the dogmas and institutions of the church untouched; aspiring above and beyond these, their aim was religious experience.

It is this striving after religious experience that gives to the Oriental monachism of the middle ages its peculiar character. In the 5th and 6th centuries Egypt and Palestine had been the classic lands of monks and monasteries. But when, in consequence of the Arab invasions, those countries were cut off from intercourse with the rest of Christendom, it decayed. Constantinople and Mount Athos gained proportionately in importance during the middle ages. At Constantinople the monastery of Studium, founded about 460, attained supreme influence during the controversy about images. On Mount Athos the first monastery was founded in the year 963, and in 1045 the number of monastic foundations had reached 180. In Greek monachism the old Hellenic ideal of the wise man who has no wants (ἄρσικος) was from the first fused with the Christian conception of unreserved self-surrender to God as the highest aim and the highest good. These ideas governed it in medieval times also, and in this way monastic life received a decided bent towards mysticism: the monks strove to realize the heavenly life even upon earth, their highest aim being the contemplation of God and of His ways. The teachings of
Symeon “the New Theologian” on these matters lived on in the cloisters; it was taken up by the Hesychasts of the 14th century, and developed into a peculiar theory as to the perception of the Divine Light. In spite of all opposition their teaching was finally justified by the Eastern Church (sixth synod of Constantinople, 1352). And rightly so, for it was the old Greek faith minted afresh.

The Eastern Church, then, throughout the middle ages, remained true in every particular to her ancient character. It cannot be said that she developed as did the Western Church during this period, for she remained what she had been; but she freely developed her original characteristics, consistently, in every direction. This too is life, though of a different type from that of the West.

There was life in the Eastern Church also proved by the fact that the power of expansion was not denied her. Through her agency an important bulwark for the Christian faith was created in the new nations which had sprung into existence since the beginning of the middle ages: the Bulgarians, the Servians, and the multifarious peoples grouped under the name of Russians. There is a vast difference in national character between these young peoples and the successors of the Hellenes; and it is therefore not strange that the Eastern Church should retain throughout her life, and religious sentiment in her case have fully preserved the Byzantine character. This proves once more the ancient capacity of the Greeks for the assimilation of foreign elements.

There was yet another outcome of this stubborn persistency of a peculiar type—the impossibility of continuing to share the life of the Western Church. Neither in the East nor in the West was a separation desired; but it was inevitable, since the lives of East and West were moving in different directions. It was the fall of Constantinople that first weakened the vital force of the Eastern Church. May we hope that the events of modern times are leading her towards a renaissance?

(b) The Nestorian and the Monophysite Churches.—Since the time when the church of eastern Syria had decided, in opposition to the church of the Empire, to cling to the ancient views of Syrian theologians—therefore also to the teaching and person of Nestorius—her relations were broken off with the church in western Syria and in Greek and Latin countries; but the power of Nestorian, or, as it was also called Jacobite, was not there completely extinguished. Separated from the West, it directed its energies towards the East, and here its nearest neighbour was the Persian Church. The latter followed, almost without opposition, the impulse received from Syria; from the rule of the patriarch Babaeus (Syr. Bâb-hâi, 498-503) she may be considered definitely Nestorian. A certain number, too, of Arabic Christians, believers living on the west coast of India, the so-called Christians of St Thomas, and finally those belonging to places nearer the middle of Asia (Merv, Herat, Samarkand), remained in communion with the Nestorian church. Thus there survived in mid-Asia a widely-scattered remnant, which, although out of touch with the ancient usages of Christian civilization, yet in no way lacked higher culture. Nestorian philosophers and medical practitioners became the teachers of the great Arabian natural philosophers of the middle ages, and the latter obtained their knowledge of Greek learning from Syriac translations of the works of Greek thinkers.

Political conditions at the beginning of the middle ages favoured the Nestorian church, and the fact that the Arabs had conquered Syria, Palestine and Egypt, made it possible for her to exert an influence on the Christians in these countries. Of still more importance was the brisk commercial intercourse between central Asia and the countries of the Far East; for this led the Nestorians into China. The inscription of Si-nangan-fu (before 781) proves a surprisingly widespread extension of the Christian faith in that country. That it also possessed adherents in southern Siberia we gather from the inscriptions of Semiretchensk, and in the beginning of the 11th century it found its way even into Mongolia. Nowhere were the nations Christian, but the Christian faith was everywhere accepted by a not insignificant minority. The foundation of the Mongolian empire in the beginning of the 13th century did not disturb the position of the Nestorians; but the revival of the Mahomedan power, which was coincident with the downfall of the Mongolian empire, was pregnant with disaster for her. The greater part of Nestorian Christendom was now swallowed up by Islam, so that only remnants of this once extensive church have survived until modern times.

The middle ages were far more disastrous for the Monophysites than for the Nestorians; in their case there was no alternation of rise and decline, and we have only a long period of gradual exhaustion to chronicle. Egypt was the home of Monophysitism, whence it extended also into Syria. It was due to the great Jacob of Edessa (Jacob Baraduas, d. 578) that it did not succumb to the persecution by the power of the Orthodox Empire, and out of gratitude to him the Monophysites of Syria called themselves Jacobites. The Arab conquest (after 635) freed the Jacobite church entirely from the oppression of the Orthodox, and thereby assured its continuance. The church, however, never attained any greater development, but on the contrary continued to lose adherents from century to century. While Jacob of Edessa is said to have ordained some 100,000 priests and deacons for his fellow-believers, in the 16th century the Jacobites numbered only 50,000 families.

The Monophysite church of Egypt had a like fate. At the time of the separation of the churches the Greeks here had remained faithful to Orthodoxy, the Copts to Monophysitism. Here too the Arab conquest (642) put an end to the oppression of the native Christians by the Greek minority; but this did not afford the Coptic church any possibility of vigorous development. It succumbed to the ceaseless alternation of tolerance and persecution which characterized the Arab rule in Egypt, and the mass of the Coptic people became unfaithful to the Church. At the time of the conquest of the country by the Turks (1517) the Coptic church seems already to have fallen to the low condition in which the 18th century found it. Though at the time of the Arab conquest the Copts were reckoned at six millions, in 1820 the Coptic Christians numbered only about one hundred thousand, and it is improbable that their number can have been much greater at the close of the middle ages. Only in Abyssinia the daughter church of the Coptic church succeeded in keeping the whole people in the Christian faith. This fact, however, was not the result of any Islamic influence; a poor result, if measured by the standard of the rich history of the Western world, yet large enough not to exclude the hope of a new development.

II. THE WEST. (a) The Early Middle Ages. The Catholic Church as influenced by the Foundation of the Teutonic States.—While the Eastern Church was stereotyping those peculiar characteristics which made her a thing apart, the Church of the West was brought face to face with the greatest revolution that Europe has ever experienced. At the end of the 6th century all the provinces of the Empire had become independent kingdoms, in which conquerors of Germanic race formed the dominant nationality. The remnants of the Empire showed an uncommonly tough vitality. It is true that the Teutonic states succeeded everywhere in establishing themselves; but only in England and in the erstwhile Roman Germany did the Roman nationality succumb to the Teutonic. In the other countries it not only maintained itself, but was able to assimilate the ruling German race; the Lombards, West Goths, Swabians, and even the Franks in Lower Germany, then, were Germanized. Consequently the position of the Christian Church was never seriously affected. This is the great fact which stands out at the beginning of the history of the Church in the middle ages. The continuity of the political history of Europe was violently interrupted by the Germanic invasion, but not that of the history of the Church. For, in view of the facts above stated, it was of small significance that in Britain Christianity was driven back into the western portion of the island still held by the Britons, and that in the countries of the Rhine and Danube a few bishoprics disappeared.

This was of the less importance, as the Church immediately made preparations to win back the lost territory. On the
frontier line of ancient and medieval times stands the figure of Gregory I., the incarnation as it were of the change that was taking place: half Father of the Church, half medieval pope. He it was who sent the monk Augustine to England, in order to win over the Anglo-Saxons to the Christian faith. Augustine was not the first preacher of the Gospel at Canterbury. A Frankish bishop, Liuthard, had laboured there before his time; but the mission of Augustine and his ordination as a bishop were decisive in the conversion of the country and the establishment of the Anglo-Saxon church. On the continent an extension of the Frankish supremacy towards the east had already led to the advance of Christendom. Not only were the bishoprics in the towns of the Rhine country re-established, but as the Franks colonized the country on both sides of the Main, they carried the Christian faith into the very heart of Germany. Finally, the dependence of the Swabian and Bavarian peoples on the Frankish empire paved the way for Christianity in those provinces also. Celtic monks worked as missionaries as in this part of the country side by side with Franks. In England it had not been possible to bring the old British and the young Anglo-Saxon churches into friendly union; but in spite of this the Celts did not abstain from working at the common tasks of Christendom, and the continent has much to thank them for. When the first century of the middle ages came to an end the Church had not only reoccupied the former territory of the Empire, she had already begun to overstep its limits. In so doing she had remained as of old and had yet become new. Creed and dogma, above all, remained unchanged. The doctrinal decisions of the ancient Church remained the indestrucible canon of belief, and what the theologians of the ancient Church had taught was revered as beyond improvement. The entire form of divine worship remained therefore unaltered. Even where the Latin tongue was not understood by the people, the Church preserved it in the Mass and in the administration of the sacraments, in her exorcisms and in her benedictions. Furthermore, the organization of ecclesiastical offices remained unchanged: the division of the Church into bishoprics and the grouping together of bishoprics into metropolitan dioceses. Finally, the property and the whole social status of the Church and of the hierarchy remained unchanged, as did also the conviction that the perfection of the Christian life was to be sought and found in the monastic profession.

Nevertheless, the new conditions did exercise the strongest influence upon the character of the Church. The churches of the Lombards, West Goths, Franks and Anglo-Saxons, all counted themselves parts of the Catholic Church; but the Catholic Church had altered its condition; it lacked the power of organization, and split up into territorial churches. Under the Empire the ecumenical council had been looked upon as the highest representative organ of the Catholic Church; but the earlier centuries of the middle ages witnessed the convocation of no ecumenical councils. Under the Empire the bishop of Rome had possessed in the Church an authority recognized and protected by the State; respect for Rome and for the successor of Saint Peter was not forgotten by the new territorial churches, but it had altered in character; legal authority had become merely moral authority; its wielder could exhort, warn, advise but could not command.

On the other hand, the kings did command in the Church. They certainly claimed no authority over faith or doctrine, and they too respected doctrinal law; but they succeeded in asserting their rights to a practical share in the government of the Church. The clergy and laity of a diocese together elected their bishop, as they had done before; but no one could become a bishop against the will of the king, and the confirmation of their choice rested with him. The bishops continued to hold in synods as before, but the councils became territorial synods; they were called together at irregular intervals by the king, and their decisions obtained legal effect only by royal sanction.

In these circumstances the intrusion of Germanic elements into ecclesiastical law is easy to understand. This is most clearly recognizable in the case of churches which arose alongside the episcopal cathedrals. In the Empire all churches, and all the property of the Church, were at the disposal of the bishops; in Germanic countries, on the contrary, the territorial nobles were looked upon as the owners of churches built upon their lands, and these became "proprietary churches." The logical consequence of this was that the territorial nobles claimed the right of appointing clergy, and the enjoyment of the revenues of these churches derived from the land (ties). Even a certain number of the monastic establishments came in this way into the possession of the feudal landowners, who nominated abbots and abbesses as they appointed the incumbents of their churches. With these conditions, and with the diminution of the ascendency of town over country that resulted from the Teutonic conquests, is connected the rise of the parochial system in the country. The parishes were further grouped together into rural deaneries and archdeaconies. Thus the diocese, hitherto a simple unit, became an elaborately articulated whole. The fabric of the middle ages bears the same name as that of the ancient Church; but in many respects it has greatness that is new.

This transformation of old institutions is the first great result of Germanic influence in the Christian Church. It continues to the present day in the universal survival of the parochial system. In the middle ages the civilizing task of the Church was first approached in England. This was the home of the Latin Christian literature and theology of medieval times. Alcuin (d. 799) and the Venerable Bede (d. 735) were the first scholars of the period. England was also the home of Winfrid Bonifatius (d. 757). We are accustomed to look upon him chiefly as a missionary; but his completion of the conversion of the peoples of central Germany (Thuringians and Hessians) and his share in that of the Frisians, are the least part of his life-work. Of more importance is the fact that, in co-operation with the bishops of Rome, he carried on the organization of the church in Bavaria, and began the reconstruction of the Frankish church, which had fallen into confusion and decay during the political disorders of the last years of the Merovingsians. It was Boniface, too, who, with the aid of numerous English priests, monks and nuns, introduced the literary culture of England into Germany.

Pippin (d. 768) and Charlemagne (d. 814) built on the foundations laid by Winfrid. For the importance of Charlemagne's work, from the point of view of the Church, consists also, not so much in the fact that, by his conversion of the Saxons, the Avars and the Wendes in the eastern Alps, he substantially extended the Church's dominions, as in his having led back the Frankish Church to the fulfillment of her functions as a religious and civilizing agent. This was the purpose of his ecclesiastical legislation. The principal means to this end taken by him was the raising of the status of the clergy. From the priests he demanded faithfulness in preaching and teaching, from the bishops the conscientious and responsible government of their dioceses. The monasteries, too, learned to serve the Church by becoming nurseries of literary and theological culture. For the purpose of carrying out his ideas Charlemagne gathered round him the best intellects of Europe. None was more intimately associated with him than the Anglo-Saxon Alcuin (d. 804); but he was only one among many. Beside him are the Celts Joseph Scottus and Dungal, the Lombards Paulinus and Paulus Diaconus, the West Goths Theodulf and many Franks. Under their guidance theology flourished in the Frankish empire. It was as little original as that of Bede; for on the continent, too, scholars were content to think what those of old had thought before them. But in so doing they did not only repeat the old formulae; the ideas of the men of old sprang into new life. This is shown by the searching discussions to which the Adoptionist controversy gave rise. At that time, the controversy with the Eastern Church over the adoration of images shows that the older Western theology felt itself equal, if not superior to the Greek. This was in fact the case; for it knew how to treat the question, which divided the Greeks, in a more dispassionate and practical manner than they. The second generation of Frankish theologians did not lag behind the first. Hrabanus of Fulda (who died archbishop of
Mainz in 856) was in the range of his knowledge undoubtedly Alcuin’s superior. He was the first learned theologian produced by Germany. His disciple, Abbot Walram of Strabo of Reichenaun (d. 849), was the author of the Gloria Ordinaria, a work which formed the foundation of biblical exposition throughout the middle ages. France was still more richly provided with theologians in the 9th century: her most prominent names are Hincmar, archbishop of Reims (d. 882), Bishop Prudentius of Troyes (d. 861), the monks Servatus Lupus (d. 862), Radbert Paschasius (d. circa 860), and Ratramnus (d. after 868); and the last theologian who came from France from abroad, Johannes Scotus Erigena (d. circa 880). The theological method of all these was merely that of restatement. But the controversy about predestination, which, in the 9th century, Hincmar and Hrabanus fought out with the monk Gottschalk of Fulda, as well as the discussions that arose from the definition of the doctrine of transubstantiation of Radbert, enabled us to gauge the intellectual energy with which theological problems were once more being handled.

Charlemagne followed his father’s policy in carrying out his ecclesiastical measures in close association with the bishops of Rome. He renewed the donation of Pippin, and as Fabrycin he took Rome under his protection. From Pope Adrian I. he received the Dionysio-Hadriana, the Roman collection of material bearing on the ancient ecclesiastical law. But the Teutonic elements maintained their place in the law of the Frankish Church and this was asserted by the fact that, since Christmas 801, the king of the Franks and Lombards had borne the title of Roman emperor. On the contrary, Rome itself was now for the first time affected by the predominance of the new empire; for Charlemagne converted the patriciate into effective sovereignty, and the successor of St Peter became the chief metropolitan of the Frankish empire.

There were, indeed, forces tending in the contrary direction; and these were present in the Frankish empire. Evidence of this is given by the canon law forgeries of the 9th century: the capitula of Angelram, the Capitularies of Benedictus Levita (see Capitulary), and the great collection of the Pseudo-Isidorian Decrinals. For the moment, however, this party met with no success. Of more importance was the fact that at Rome the old conditions, the old claims, and the old law were unfortunated. Developing the ideas of Leo I., Gelasius I. and Gregory the Great, Nicholas I. (858-867) drew a picture of the divine right and unlimited power of the bishop of Rome, which anticipated all that the greatest of his successors were, centuries later, actually to effect. The time had not, however, yet come for the establishment of the papal world-dominion. For while the power of Charlemagne was decaying, the papacy itself became involved in the confusion of the party strife of Italy and of the city of Rome, and was plunged in consequence into such an abyss of degradation (the so-called Pernocracy), that it was in danger of forfeiting every shred of its moral authority over Christendom.

Central Period of the Middle Ages. The practice customary in Germany was finally transferred to Rome itself. The desperate position of the papacy in the 10th century obliged Henry III. to intervene. When, on the 24th of December 1046, after three rival popes had been set aside, he nominated Suidgar, bishop of Bamberg, as bishop of Rome before all the people in St Peter’s, the papacy was bestowed in the same way as a German bishopric; and what had occurred in this case was to become the rule. By procuring the transference of the patriciate from the Roman people to himself Henry assured his influence over the appointment of the popes, and accordingly also nominated the successors of Clement II.

His intervention saved the papacy. For the popes nominated by him, Leo IX. in particular, were men of high character, who exercised their office in a lofty spirit than their corrupt predecessors. They placed themselves at the head of the movement for ecclesiastical reform. But was it possible for the relation between Empire and Papacy to remain what Henry III. had made it?

The original sources of this reform movement lay far back, in the time of the Carolingians. It has been pointed out how Charlemagne pressed the monks into the service of his civilizing aims. We admire this; but it is certain that he thereby alienated monasticism from its original ideals. These, however, had far too strong a hold upon the Roman world for a reaction against the new movement to be long avoided. This reaction began with the reform of Benedict of Aniane (d. 831), the aim of which was to bring the Benedictine order back to the principles of its original rules. In the next century the reform movement acquired a fresh centre in the Burgundian monastery of Cluny. The energy of a succession of distinguished abbots and the disciples whom they inspired succeeded in bringing about the victory of the reforming ideas in the French monasteries; once more the rule of St Benedict controlled the life of the monks. A large number of the reformed monasteries attached themselves to the congregation of Cluny, thus assuring the influence of reformed monasticism upon the Church, and securing likewise its independence of the diocesan bishops, since the abbot of Cluny was subordinate of the pope alone. (See Cluny; Benedictines and Monasticism.) At the same time that Cluny began to grow into importance, other centres of the monastic reform movement were established in Upper and Lower Lorraine; and before long the activity of the Cluniac monks made itself felt in Italy. In Germany Poppo of Stavelot (d. 1048) was a successful champion of their ideas; in England Dunstan (d. 988 as archbishop of Canterbury) worked independently, but on similar lines. Everywhere nomination of bishops, election of archbishops, and other reforms followed. Under Henry III. the renewal of discipline, and also the economic improvement of the monasteries. The reform movement had originally no connexion with ecclesiastical politics; but that came later when the leaders turned their attention to the abuses prevalent among the clergy, to the conditions obtaining in the Church in defiance of the ecclesiastical law. “Return to the canon law!” was now the battle-cry. In the Cluniac circle was coined the principle: Canonica auctoritas Dei lex est, canon law being taken in the Pseudo-Isidorian sense. The programme of reform thus included not only the extirpation of simony and Nicolaitism, but also the freeing of the Church from the influence of the State, the recovery of her absolute control over all her possessions, the liberty of the Church and of the hierarchy.

As a result, the party of reform placed itself in opposition to those ecclesiastical conditions which had arisen since the conversion of the Teutonic peoples. It was then, a fact pregnant with the most momentous consequences that Leo IX. attacked himself to the party of reform. For, thanks to him and to the men he gathered round him (Hildebrand, Humbert and others), their principles were established in Rome, and the pope himself became the leader of ecclesiastical reform. But the carrying out of reforms led at once to disensions with the civil power, the starting-point being the attack upon simony.

Originally, in accordance with Acts viii. 18 et seq., simony was held to be the purchase of ordination. In the 9th century the interpretation was extended to include all acquisition of
eclesiastical offices or benefices for money or money's worth. Since the landed proprietors disposed of churches and convents, and the kings of bishoprics and abbeys, it became possible for them too to commit the sin of simony; hence a final expansion, in the 12th century, of the meaning of the term. The Pseudo-Isidorian idea being that all lay control over things ecclesiastical is wrong, all transfersence by laymen of ecclesiastical offices or benefices, even though no money changed hands in the process, were now classed as simony (Humbert, Adversus Simoniacos, 1057–1058). Thus the lord who handed over a living was a simonist, and so too was the king who invested a bishop. On this question the battle began. The Church at first refrained from contesting the rights of the landowners over their own churches, and concentrated her attack upon investiture. In 1059 the new system of papal election introduced by Nicholas II. ensured the occupation of the Holy See by a pope favourable to the party of reform; and in 1078 Gregory VII. issued his prohibition of lay investiture. In the years of conflict that followed Gregory looked far beyond this point; he set his aim even higher; until, in the end, his idea was to concentrate all ecclesiastical power in the hands of the pope, and to raise the papacy to the level of the empire. But without a doubt the old dream of Augustine: that of a Kingdom of God on earth, under the rule of the Church. But it was not given to Gregory to reach this goal, and his successors had to return again to the strife over investiture. The settlement of 1111 may be said to have embodied the only solution of the great question that was right in principle, since it pronounced in favour of a clear distinction between the spiritual and temporal spheres. However, a solution that was right in principle proved impossible in practice, and the long struggle ended in a compromise by the Concordat of Worms (1122). The essential part of this was that the Empire accepted the canonical election of bishops, and allowed the metropolitan to confer the sacred office by gift of ring and pastoral staff; while the Church acknowledged that the bishop held his temporal rights from the Empire, and was therefore to be invested with them by a touch from the royal sceptre. A similar solution was arrived at in England. Henry I. also renounced his claim to bestow ring and pastoral staff, but kept the right of induction into the temporalities (1106–1107). In France the demands of the Church were successful to the same degree as in England and in Normandy. But an innovation of French origin—the Old German element in the law regarding appointment to bishoprics—was now eliminated. Somewhat later it disappeared also in the case of the churches of less importance, patronal rights over these being substituted for the former absolute ownership. The pontificate of Alexander III. (1159–1181) decided this.

Since the time of Charlemagne German influence had preponderated in the West, as is shown in the expansion of the Church no less than in matters of ecclesiastical law. The whole progress of Christianity in Europe from the 6th to the 12th century was due—if we exclude Eastern Christendom—to the Teutonic nations; neither the papacy nor the peoples of Latin race were concerned in it. German priests and bishops carried the Christian faith to the Czechs and the Moravians, laboured among the Hungarians and the Poles, and won the wide district between the Elbe and the Oder at once for Christianity and for the German nation. Germany, too, was the starting-point for the conversion of the Scandinavian countries, which was completed by English priests with the assistance of native princes. But when the Teutonic peoples were thus making the lead, we can see the Latin races becoming the great teachers of ethics. The monastic reform movement was essentially Latin in origin; and even more significant was the fact that scholasticism, the new theology, had its home in the Latin countries. Aristotelian dialectics had always been taught in the schools; and reason as well as authority had been appealed to as the foundation of theology; but for the theologians of the 9th and 10th centuries, whose method had been merely that of restatement, ratio and auctoritas were in perfect accord. Then Berengar of Tours (d. 1088) ventured to set up reason against authority; by reason the truth must be decided. This involved the question of the relation in theology of authority and reason, and of whether the theological method is authoritative or rational. To these questions Berengar gave no answer; he was ruined by his opposition to Radbert's doctrine of transubstantiation. The Lombard Anselm (d. 1109), archbishop of Canterbury, was the first to deal with the subject. He took as his starting-point the traditional faith; but he was convinced that whoever has experience of the truths of the faith would be able to understand them. In accordance with this principle he pointed out the goal of theology and the way to its attainment: the function of theology is to demonstrate domgas sola ratione.

It was a bold conception—too bold for the medieval world, for which faith was primarily the obligation to believe. It was easy, therefore, to understand why Anselm's method did not become the dominant one in theology. Not he, but the Frenchman Abelard (d. 1142), was the creator of the scholastic method. Abelard, too, started from tradition; but he discovered that the statements of the various authorities are very often in the relation of sic et non, yes and no. Upon this fact he based his pronouncement as to the function of theology: it must employ the dialectic method to reconcile the contradictions of tradition, and thus to shape the doctrines of the faith in accordance with reason. Thus by textual criticism and by the method of restatement he helped to form the rationalism of the great theological systems of the schoolmen of the 12th and 13th centuries: Peter Lombard (d. 1160), Alexander of Hales (d. 1245), Albertus Magnus (d. 1280), and Thomas Aquinas (d. 1275). They adventured a complete exposition of Christian doctrine that should be altogether ecclesiastical and at the same time altogether rational. In so doing they set to work at the same time to complete the development of ecclesiastical dogma; the formulation of the Catholic doctrine of the Sacraments was the work of scholasticism.

Canon law is the twin-sister of scholasticism. At the very time when Peter Lombard was shaping his Sentences, the monk Gratian of Bologna was making a new collection of laws. It was not only significant that in the Concordia discordantium canonum ecclesiastical laws, whether from authentic or forged sources, were gathered together without regard to the existing civil law; of even greater eventual importance was the fact that Gratian taught that the contradictions of the canon law were to be reconciled by the same method as that used by theology to reconcile the discrepancies of doctrinal tradition. Thus Gratian became the founder of the science of canon law, a science which, like the scholastic theology, was entirely ecclesiastical and entirely rational (see Canon Law).

Like the new theology and the new science of law, the new monasticism was also rooted in Latin soil. In the first of the new orders, that of the Cistercians (1088), the old monastic ideal set forth in the Rule of Benedict of Nursia still prevailed; but in the constitution and government of the order new ideas were at work. In the Premonstratensian order, however, founded in 1120 by Norbert of Xanten, a new conception of the whole function of monachism was introduced: the duty of the priest-monk is not only to work out his own salvation, but, by preaching and cure of souls, to labour for others. This was the dominant idea of the order of friars preachers founded in 1216, on the basis of the Premonstratensian rule, by Dominic of Osma (see Dominican, Saint, and Dominicans). It was also the basis of the order of friars minor (Franciscans, q.v.), founded in 1210. For the foundation of Francis of Assisi came into existence as a society of itinerant preacher: no one was more conscious than Francis of the duty of working for others, and his own mission in this world, he said, "to win souls." But with this idea he fused another, namely, that it is the task of the monk to imitate the humility and poverty of Jesus; and his order thus became a mendicant order. From the earliest times the monks had renounced all private property, and no individual monk, but only the order to which he belonged, could acquire possessions. For Francis this was not enough: he put "holy poverty" in place of renunciation of private property, and allowed neither monk nor monastery to have any possessions whatever; for only thus is the following of Jesus complete. So
might be the impression made by the poverty of the Minorites, that the Dominicans promptly followed their example and likewise became mendicant.

This alone would serve to indicate the remarkable deepening of that religious life that had taken place in the Latin countries. Its beginning may be traced as early as the 11th century (Pietro Damiani, q.v.), and in the 12th century the most influential exponent of this new piety was Bernard (q.v.) of Clairvaux, who taught men to find God by leading them to Christ. Contemporary with him were Hugh (q.v.) of St Victor and his pupil Richard (q.v.) of St Victor, both monks of the abbey of St Victor at Paris, the aim of whose teaching, based on that of the Pseudo-Dionysius, was a mystical absorption of thought in the Godhead and the surrender of self to the Eternal Love. Under the influence of these ideas, in part purely Christian and in part neo-platonic, piety gained in warmth and depth and became more personal; and though at first it flourished in the monasteries, and in those of the mendicant orders especially, it penetrated far beyond them and influenced the laity everywhere.

The new piety did not set itself in opposition either to the hierarchy or to the institutions of the Church, such as the sacraments and the discipline of penance, nor did it reject those foreign elements (asceticism, worship of saints and the like) which had passed of old time into Christianity from its Grecian world. It tempered the monastic nations to battle for Christendom. In the 11th and 12th centuries the chivalry of Spain and southern France took up the struggle with the Moors as a holy war. In the autumn of 1096 the nobles of France and Italy, joined by the Norman barons of England and Sicily, set out to wrest the Holy Land from the unbelievers; and for more than a century the cry, "Christ's land must be won for Christ," exercised an unparalleled power in Western Christendom.

All this meant a mighty exaltation of the Church, which ruled the minds of men as she had hardly ever done before. Nor was it possible that the position of the bishop of Rome, the supreme head of the Western Church, should remain unaffected by it. Two of the most powerful of the German emperors, Frederick I. and his son Henry VI., struggled to renew and to maintain the imperial supremacy over the papacy. The close relations between northern Italy and the Empire, and the union of the sovereignty of southern Italy with the German crown, seemed to afford the means for keeping Rome in subjection. But Frederick I. fought a losing battle, and when at the peace of Constance (1183) as pope, he relinquished the hope of carrying out his Italian policy; while Henry VI. died at the early age of thirty-two (1197), before his far-reaching schemes had been realized.

The field was thus cleared for the full development of papal power. This had greatly increased since the Concordat of Worms, and reached its height under Innocent III. (1198-1216). Innocent believed himself to be the representative of God, and as such the supreme possessor of both spiritual and temporal power. He therefore claimed in both spheres the supreme administrative, legislative and judicial authority. Just as he considered himself entitled to appoint to all ecclesiastical offices, so also he invested the emperor with his empire and kings with their kingdoms. Not only did he despacht his decretales to the universities to form the basis of the teaching of the canon law and of the decisions founded upon it, but he considered himself empowered to annul civil laws. Thus he annulled the Great Charter in 1215. Just as the Curia was the supreme court of appeal in ecclesiastical causes, so also the pope threatened disobedient princes, e.g. the emperor Otto IV. in 1198, and John of England in 1212.

The old institutions of the Catholic Church were transformed to suit the new position of the pope. From 1123 onward there had again been talk of general councils; but, unlike those of earlier times, these were assemblies summoned by the pope, who confirmed their resolutions. The canonical election of bishops also continued to be discussed; but the old electors, i.e. the clergy and laity of the dioceses, were deprived of the right of election, this being now transferred exclusively to the cathedral chapters. The bishops kept their old title, but they described themselves accurately as "bishops by grace of the apostolic see," for they administered their dioceses as pleni-potentiaries of the pope; and as time went on, even the Church's criminal jurisdiction became more and more concentrated in the hands of the pope (see Inquisition).

The rule of the Church by the Roman bishop had thus become a reality; but the papal claim to supreme temporal authority proved impossible to maintain, although Innocent III. had apparently enforced it. The long struggle against Frederick II., carried on by Gregory IX. (1227-1241) and Innocent IV. (1243-1254), did not result in victory; no papal sentence, but only death itself, deprived the emperor of his dominions; and when Boniface VIII. (1294-1303), who in the bull Unam Sanctam (1302) gave the papal claims to universal dominion their classical form, quarrelled with Philip IV. of France about the extension of the royal power, he could not but perceive that the national monarchy had become a force which it was impossible for the papacy to overcome.

(c) Close of the Middle Ages. Disintegration.—While the Church was yet at the height of her power the great revolution began, which was to end in the dissolution of that union between the Church and either of the two powers, no longer distinct, which had characterized the life of the West. The temporal claims not only renounced its proper rights. The political power of the Empire, indeed, had been shattered; but this left all the more room for the vigorous development of national states, notably of France and England. At the same time intellectual life was enriched by a wealth of fresh views and new ideas, partly the result of the busy intercourse with the East to which the Crusades had given the first impetus, and which had been strengthened and extended by lively trade relations, partly of the revived study, eagerly pursued, of ancient philosophy and literature (see Renaissance). Old forms became too narrow, and vigorously growing national literatures appeared side by side with the universal Latin literature. The life of the Church, moreover, was affected by the economic changes due to the rise of the power of money as opposed to the old economic system based on land.

The effects of these changes made themselves felt on all sides, in no case more strongly than in that of the papal claims to the supreme government of the world. Theoretically they were still unwaveringly asserted; indeed it was not till this time that they were further strengthened by the triumph of the papal form (Augustinus Triumphus, d. 1328; Alvarus Pelagius, d. 1352). After Boniface VIII., however, no pope seriously attempted to realize them; to do so had in fact become impossible, for from the time of their residence at Avignon (1305-1377) the popes were in a state of complete dependence upon the French crown. But even the curialistic theory met everywhere with opposition. In France Philip IV.'s jurists maintained that the temporal power was independent of the spiritual. In Italy, a little later, Dante championed the divine right of the emperor (De Monarchia, 1311). In Germany, Marsiglio of Padua and Jean of Jandun, the literary allies of the emperor Louis IV., ventured to define anew the nature of the civil power from the standpoint of natural law, and to assert its absolute sovereignty (Defensor pacis, c. 1352); while the Franciscan William of Occam (d. 1349) examined, also in Louis' interests, into the nature of the relation between the two powers. He too concludes that the temporal power is independent of the spiritual, and is even justified in invading the sphere of the latter in cases of necessity.

While the thought was growing in man's minds, opposition to the temporal rule over the Church was also gaining continually in strength. The reasons for this were numerous, first among them being the abuses of the papal system of finance, which had to provide funds for the vast administrative machinery of the Curia. There was also the boundless abuse and arbitrary exercise of the right of ecclesiastical patronage (provisions, reservations); and further the ever-increasing traffic in dispensations, the abuse of spiritual punishments for worldly ends, and so forth. No means, however, existed of enforcing any
remedy until the papal schism occurred in 1378. Such a schism as this, so intolerable to the ecclesiastical sense of the middle ages, necessitated the discovery of some authority superior to the rival popes, and therefore able to put an end to their quarrelling. General councils were now once more called to mind; but these were no longer conceived as mere advisory councils to the pope, but as the highest representative organ of the universal Church, and as such ranking above the pope, and competent to demand obedience even from him. This was the view of the Germans Conrad of Gelnhausen (d. 1390) and Heinrich of Langenstein (d. 1397), as also of the Frenchmen Pierre d'Ailly (d. 1420) and Jean Charlier Gerson (d. 1429). These all recognized in the convocation of a general council the means of setting bounds to the abuses in the government of the Church by an extensive reform. The council of Pisa (1409) separated without effecting anything; but the council of Constance (1414-1418) did actually put an end to the schism. The reforms begun at Constance and continued at Basel (1431-1449) proved, however, insufficient. Above all, the attempt to set up the general council as an ordinary institution of the Catholic Church failed; and the Roman papacy, restored at Constance, preserved its irresponsible and unlimited power and annexed to its government an extensive territory. (See Papacy; Councils, General, and Basel, Council of.)

Thus the attempt to reform the Church by means of councils failed; but this very failure led to the survival of the desire for reform. It was kept alive by the most various circumstances; in the first instance by the attitude of the European states. Thanks to his recognition by the powers, Pope Eugenius IV. (1431-1447) had been victorious over the council of Basel; but neither France nor Germany was prepared to forgo the reforms passed by the council. France secured their validity, as far as she herself was concerned, by the Pragmatic Sanction of Bourges (July 7, 1438); Germany followed with the Acceptation of Mainz (March 26, 1439). The theory of the papal supremacy held by the Curia was thus at least called in question.

The antagonism of the opposition parties was even more pronounced. The tendencies which they represented had been present when the middle ages were yet at their height; but the papacy, while at the zenith of its power, had succeeded in crushing the attacks made upon the creed of the Church by its most dangerous opponents. But the dawning of the 15th century had shown the Church unable to overcome the less radical opposition of the "Poor Man of Lyons" (Waldo, d. c. 1217), and even in the 15th century straay supporters of the Waldensian teaching were to be found in Italy, France and Germany, everywhere keeping alive mistrust of the temporal power of the Church, of her priesthood and her hierarchy. In England the hierarchy was attacked by John Wycliffe (d. 1384), its greatest opponent before Luther. Starting from Augustine's conception of the Church as the community of the elect, he protested against a church of wealth and power, a church that had become a political institution instead of a school of salvation, and against its head, the bishop of Rome. Wycliffe's ideas, conveyed to the continent, precipitated the outbreak of the Hussite storm in Bohemia. The council of Constance thought to quell it by condemnation of Wycliffe's teaching and by the execution of John Huss (1415). But in vain. The flame burst forth, not in Bohemia alone, where Huss's death gave the signal for a general rising, but also in England among the Lollards, and in Germany among those of Huss's persuasion, who had many points of agreement with the remnant of the Waldenses.

(See Huss; Wycliffe; Lollards; Waldenses.)

This was open opposition; but there was besides another opposing force which, though it raised no noise of controversy, yet was far more widely severed from the views of the Church than either Wycliffe or Huss: this was the Renaissance, which began its reign in Italy during the 14th century. The Renaissance meant the emancipation of the secular world from the domination of the Church, and it contributed in no small measure to the rupture of the educated class with ecclesiastical tradition. Beauty of form alone was at first sought, and found in the antique; but, with the form, the spirit of the classical attitude towards life was revived. While the Church, like a careful mother, sought to lead her children, never allowed to grow up, safely from time into eternity, the men of the Renaissance felt that they had come of age, and that they were entitled to make themselves at home in this world. They wished to possess the earth and enjoy it by means of secular education and culture, and an impassable gulf yawned between their views of religion and morality and those of the Church.

This return to the ideals of antiquity did not remain confined to Italy, but the humanism of the northern countries presents no close parallel to the Italian renaissance. However much it agreed in admiration of the ancients, it differed absolutely in its preservation of the fundamental ideas of Christianity. But neither Reuchlin (d. 1522), Erasmus (d. 1536), Faber d'Étapes (d. 1536), Thomas More (d. 1535), nor the numerous others who were their disciples, or who shared their views, were in the least degree satisfied with the conditions prevailing in the Church. Their ideal was a return to that simplicity of primitive Christendom which they believed they found revealed in the New Testament and in the writings of the early Fathers.

To this theology could not point the way. Since the time of Duns Scotus (d. 1308) theologians had been conscious of the discrepancy between Aristotelian and Christian doctrine. Faith in the infallibility of the scholastic system was thus shaken, and the system itself was destroyed by the revival of philosophic nominalism, which had been discredited in the 11th century by the realism of the great scholmen. It now found a bold supporter in William of Occam (a.v.), and through him became widely accepted. But nominalism was powerless to inspire theology with new life; on the contrary, its intervention only increased the inextricable tangle of the hair-splitting questions with which theology busied itself, and made their solution more and more impossible.

Mysticism, moreover, which had been a noteworthy supporter in the 14th and 15th centuries, and the various new departures in thought initiated by individual theologians such as Nicolai Cusanus (d. 1464) and Wessel Gansfort (d. 1489), were not competent to restore to the Church what she had once possessed in scholasticism—that is to say, a conception of Christianity in which all Christendom recognized the convictions in which it lived and had its being. This was all the more significant because Western Christendom in the 15th century meant irreligious. Men's minds were agitated by spiritual questions, and they sought salvation and the assurance of salvation, using every means prescribed by the Church: confession and the communio, indulgences and relics, pilgrimages and oblations, prayers and attendance at church; none of all these were condemned or held cheap. Yet the age had no inward peace.

After the failure of the attempts at reform by the councils, the guidance of the Church was left undisturbed in the hands of the popes, and they were determined that it should remain so. In 1450 Eugenius IV. set up in opposition to the council of Basel a general council summoned by himself, which met first at Ferrara and afterwards at Florence. Here he appeared to score a great success. The split between East and West had led in the 11th century to the rupture of ecclesiastical relations between Rome and Constantinople. This schism had lasted since the 16th of July 1054; but now a union with the Eastern Church was successfully accomplished at Florence. Eugenius certainly owed his success merely to the political necessities of the emperor of the West, who had been unable to acquiesce in the papal supremacy granted by the Council of Florence; yet at the same time his decreets of union were not devoid of importance, for in them the pope reaffirmed the scholastic doctrine regarding the sacraments as a dogma of the Church, and he spoke as the supreme head of all Christendom.

This claim to the supreme government of the Church was to be steadily maintained. In the year 1512 Julius II. called together the fifth Lateran general council, which expressly recognized the subscription of the councils to the pope (Leo X.'s bull Pastor Aeternum, of the 19th of December 1516), and also declared the constitution Unam Sanctam (see above) valid in law.
CHURCH HISTORY

But the papacy that sought to win back old position it was no longer the same as of old. Evangelus IV. a successor, N. (1447-1455); H. Reuter, die ersten Renaissance Popes. Under his successor views which prevailed at the secular courts of the Italian princes came likewise into play at the Curia: the papacy became an Italian principedom. Innocent VIII., Alexander VI., Julius II. were in many respects remarkable men, but they were scarcely affected by the convictions of the Christian faith. The terrible tragedy which was consummated on the 23rd of July 1498 before the Palazzo Vecchio, in Florence, casts a lurid light upon the irreconcilable opposition in which the wearers of the papal dignity stood to medieval piety; for Girolamo Savonarola was in every fibre a loyal son of the medieval Church.

Twenty years after Savonarola’s death Martin Luther made public his theses against indulgences. The Reformation which thus began brought the disintegrating process of the middle ages to an end, and at the same time divided Western Catholicism in two. Yet we may say that this was its salvation; for the struggle against Luther drove the papacy back to its ecclesiastical duties, and the council of Trent established medieval dogma as the doctrine of modern Catholicism in contradiction to Protestantism. — RENAISSANCE; REFORMATION; and biographies of popes, &c.

C. THE MODERN CHURCH

The issue in 1564 of the canons of the council of Trent marks a very definite epoch in the history of the Christian Church. Up till that time, in spite of the schism of East and West and of innumerable heresies, the idea of the Church as Catholic, not only in its faith but in its organization, had been generally accepted. From this conception the Reformers had, at the outset, no intention of departing. Their object had been to purify the Church of medieval accretions, and to restore the primitive model in the light of the new learning; the idea of rival "churches," differing in their fundamental doctrines and in their principles of organization, existing side by side, was as abhorrent to them as to the most rigid partisan of Roman centralization. The actual divisions of Western Christendom are the outcome, less of the purely religious influences of the Reformation period than of the political forces with which they were associated and confused. When it became clear that the idea of doctrinal change would find no acceptance at Rome, the Reformers appealed to the divine authority of the civil power against that of the pope; and princes within their several states succeeded, as the result of purely political struggles and combinations, in establishing the form of religion best suited to their convictions or their policy. Thus over a great part of Europe the Catholic Church was split up into territorial or national churches, which, whatever the theoretical ties which bound them together, were in fact separate organizations, tending ever more and more to become isolated and self-contained units with no formal intercommunication, and, as the rivalry of nationalities grew, with increasingly little even of intercommunication.

It was not, indeed, till the settlement of Westphalia in 1648, after the Thirty Years’ War, that this territorial division of Christendom became stereotyped, but the process had been going on for hundred years previously. In some states, as in Prussia and the Papal States, the Roman Church had been subdued; as in South Germany, Bohemia and Poland, it was defeated by the political and missionary efforts of the Jesuits and other agents of the counter-Reformation. In any case, it received a vast impetus from the action of the council of Trent. With the issue of the Tridentine canons, all hope even of compromise between the "new" and the "old" religions was definitely closed. The anathema of the Roman Church had fallen upon all the fundamental doctrines for which the Reformers had contended and died; the right of free discussion within the limits of the creed, which had given room for the speculations of the medieval philosophers, was henceforth curtailed and confined; and the definitions of the schoolmen were for ever exalted by the authority of Rome into dogmas of the Church. The Latin Church, which by combining the tradition of the Roman centralized organization with a great elasticity in practice and in the interpretation of doctrine, had hitherto been the moulding force of civilization in the West, is henceforth more or less in antagonism to that civilization, which advances in all its branches—in science, in literature, in art—to a greater or less degree outside of and in spite of her, until in its ultimate and most characteristic developments it falls under the formal condemnation of the pope, formulated in the famous Syllabus of 1864. Considered from the standpoint of the world outside, the Roman Church is, no less than the Protestant communities, merely one of the sects into which Western Christendom has been divided—the most important and widespread, it is true, but playing in the general life and thought of the world a part immeasurably less important than that filled by the Church before the Reformation, and in one in no sense justifying her claim to be considered as the sole inheritor of the tradition of the pre-Reformation Church.

If this be true of the Roman Catholic Church, it is still more so of the other great communities and confessions which emerged from the controversies of the Reformation. Of these the Anglican Church held most closely to the tradition of Catholic organization; but she has never made any higher claim than to be one of the "three branches of the Catholic Church," a claim repudiated by Rome and never formally admitted by the Church of the East. The Protestant churches established on the continent, even where—as in the case of the Lutherans—they approximate more closely than the official Anglican Church to Roman doctrine and practice, make no such claim. The Bible is for them the real source of authority in doctrine; their organization is part and parcel of that of the state. They are, in fact, the state in its religious aspect, and as such are territorial or national, not Catholic. This tendency has been common in the East also, where with the growth of racial rivalries the Orthodox Church has split into a series of national churches, holding the same faith but independent as to organization.

A yet further development, of comparatively recent growth, has been the formation of what are now commonly called in
England the "free churches." These represent a theory of the
Church practicably unknown to the Reformers, and only reached
through the necessity for discovering a logical basis for the
communities of conscientious dissenters from the established
churches. According to this the Catholic Church is not a visibly
organized body, but the sum of all "faithful people" throughout
the world, who group themselves in churches modelled according
to their convictions or needs. For the organization of these
curches no divine sanction is claimed, though all are theoretically
modelled on the lines laid down in the Christian Scriptures.
It follows that, while in the traditional Church, with its claim to
an unbroken descent from a divine original, the individual is
subordinate to the Church, in the "free churches" the Church
is in a certain sense secondary to the individual. The believer
may pass from one community to another without imperilling his
spiritual life, or even establish a new church without necessarily
incurring the reproach of schism. From this theory, powerful
in Great Britain and her colonies, supreme in the United States
of America, has resulted an enormous multiplication of sects.

It follows from the above argument that, from the period
of the Reformation onward, no historical account of the Christian
Church as a whole, and considered as a definite institution, is
possible. We must consider the Church as a human institution,
for into innumerable channels. The only possible synthesis is that
of the Christianity common to all; as institutions, though they
possess many features in common, their history is separate and
must be separately dealt with. The history of the various
branches of the Christian Church since the Reformation will
therefore be found under their several titles (see Roman Catholic
Church; England, Church of; Presbyterianism; Baptists,
&c., &c.).

W. A. P.

CHURCHILL, CHARLES (1731-1764), English poet and
satirist, was born in Vine Street, Westminster, in February 1731.
His father, rector of Rainham, Essex, held the curacy
and lecturership of St John’s, Westminster, from 1733, and the
son was educated at Westminster school, where he became a
good classical scholar, and formed a close and lasting intimacy
with Robert Lloyd. Churchill was entered at Trinity College,
Cambridge, in 1749, but never resided. He had been refused at
Oxford, ostensibly on the unlikely ground of lack of classical
knowledge, but more probably because of a hasty marriage
which he had contracted within the rules of the Fleet in his
eighteenth year. His wife was his father’s elder daughter, and
Churchill was afterwards sent to the north of England to
prepare for holy orders. He became curate of South Cadbury,
Somersetshire, and, on receiving priest’s orders (1756), began to
act as his father’s curate at Rainham. Two years later the elder
Churchill died, and the son was elected to succeed him in his
curacy and lecturership. His emoluments amounted to less than
£100 a year, and he increased his income by teaching in a girls’
school. He fulfilled his various duties with decorum for a while,
but his marriage proved unfortunate, and he spent much of his
time in dissipation in the society of Robert Lloyd. He was
separated from his wife in 1761, and would have been imprisoned
for debt but for the timely help of Lloyd’s father, who had been
an usher and was now a master of Westminster school.
Churchill had already done some work for the booksellers,
and his friend Lloyd had had some success with a didactic poem,
"The Actor." His intimate knowledge of the theatre was now
turned to account in the Rosciad, which appeared in March 1761.
This reckless and amusing satire described with the most
discouraging accuracy the faults of the various actors and actresses
on the London stage. Its immediate popularity was not due
largely to its personal character, though its real vivacity and
raciness make it worth reading even now when the objects of
Churchill’s wit are many of them forgotten. The first impression
was published anonymously, and in the Critical Review, conducted
by Tobias Smollett, it was confidently asserted that the poem
was the joint production of George Colman, Bonnell Thornton
and Robert Lloyd. Churchill owned the authorship and immedi-
ately published an Apology addressed to the Critical Reviewers,
which, after developing the subject that it is only the cæse of
authors that prey on their own kind, repeats the fierce attack
on the stage. Incidentally it contains an enthusiastic tribute to
Dryden, of whom Churchill was a not unworthy scholar. In the
Rosciad he had given warm praise to Mr Pritchard, Mrs
Cibber and Mrs Clive, but no leading London actor, except the
exception of David Garrick, had escaped censure, and in the
Apoloby Garrick was clearly threatened. He deprecated criticism
by showing every possible civility to Churchill, who became a
terror to the actors. Thomas Davies wrote to Garrick attributing
his blundering in the part of Cymbeline “to my accidentally
seeing Mr Churchill in the pit, it rendering me confused and
unmindful of my business.” Churchill’s satire made him many
enemies, and inquiries into his way of life provided abundant
matter for retort. In Night, an Epistle to Robert Lloyd (1761),
he answered the attacks made on him, offering by way of defence
the argument that any faults were better than hypocrisy. His
scandalous conduct brought down the censure of the dean of
Westminster, and in 1763 the protests of his parishioners led
him to resign his offices, and he was free to wear his “blue coat
with metal buttons” and much gold lace without remonstrance
from the dean. The Rosciad had been refused by several pub-
lisbers, and was finally published at Churchill’s own expense.
His Epistle to William Hogarth (1763) was in answer to the
caricature of Wilkes made during the trial. In it Hogarth’s
vanity and envy were attacked in an invective which Garrick
quoted as “shocking and barbarous.” Hogarth retaliated by a
caricature of Churchill as a bear in torn clerical bands hugging
a pot of porter and a club made of lies and North Britons. The
Duellists (1763) is a virulent satire on the most active opponents
of Wilkes in the House of Lords, especially on Bishop Warburton.
He attacked Dr Johnson among others in The Ghost as “Pomposo,
and toad-bellowing scholar;” with an infamous scribbling crowd.”
Other poems are “The Conference” (1763), which was highly
praised by Churchill’s contemporaries; “Gotham” (1764), a poem
on the duties of a king, didactic rather than satiric in tone; “The
Candidate” (1764), a satire on John Montagu, fourth earl of
Sandwich, one of Wilkes’s bitterest enemies, whom he had already
 denounced for his treachery in the Duellists (Bk. iii.) as “too infamous to have a friend;” “The
Farewell” (1764); “The Times” (1764); “Independence,”
and an unfinished “Journey.”

In October 1764 he went to Boulogne to join Wilkes. There
he was attacked by a fever of which he died on the 4th of November.
He left his property to his two sons, and made Wilkes his literary
executor with full powers. Wilkes did little. He wrote an
epitaph for his friend and about half a dozen notes on his poems,
and Andrew Kippis acknowledges some slight assistance from him
in preparing his life of Churchill for the Biographia Britannica
(1780). There is more than one instance of Churchill’s generosity
to his friends. In 1763 he found his friend Robert Lloyd in
prison for debt. He paid a guinea a week for his better mainte-
ance, and Lloyd was free. Some years later, Lloyd fell ill on receipt of the news of Churchill’s death, and died
shortly afterwards. Churchill’s sister Patty, who was engaged to
Lloyd, did not long survive them. William Cowper was his
schoolfellow, and left many kindly references to him.

A partial collection of Churchill’s poems appeared in 1763.
They are included in Chalmers’s edition of the English poets, and
were edited (1804) by W. Tooke. This was reprinted in the Aldine
edition (1844). There is a revised edition (1802) in the same
series, The Poetical Works of Charles Churchill, with a Memoir by J. L.
Hannay and copious notes by W. Tooke. For Churchill’s biography,
Churchill, Lord Randolph Henry Spencer (1849–1895). English statesman, third son of John, seventh duke of Marlborough, by Frances, daughter of the third marquess of Londonderry, was born at Blenheim Palace, on the 13th of February 1849. His early education was conducted at home, and at Mr Tabor's preparatory school at Cheam. In January 1863 he went to Eton, where he remained till July 1865. He was not specially distinguished either in school or games while at Eton; his contemporaries describe him as a vivacious and rather unruly lad. In October 1867 he matriculated at Merton College, Oxford. He was fond of amusement, and had carried to Oxford an early taste for sport which he retained throughout life. But he read with some industry, and obtained a second class in jurisprudence and modern history in 1870. In 1874 he was elected to parliament in the Conservative interest for Woodstock, defeating Mr George Brodrick, a fellow, and afterwards warden, of Merton College. His maiden speech, delivered in his first session, made no impression on the House.

It was not till 1878 that he forced himself into public notice as the exponent of a species of independent Conservatism. He directed a series of furious attacks against some of the occupants of the front ministerial bench, and especially that "old gang" who were distinguished rather for the respectability of their private characters, and the unblemished purity of their Toryism, than for striking talent. Mr Scetler-Booth (afterwards 1st Lord Basing), president of the Local Government Board, was the especial object of his ire, and that minister's County Government Bill was fiercely denounced as the "crowning dishonesty to Tory principles," and the "supreme violation of political honesty." The audacity of Lord Randolph's attitude, and the vituperative fluency of his invective, made him a parliamentary figure of some importance before the dissolution of the 1874 parliament, though he was not as yet taken quite seriously. In the new parliament of 1880 he speedily began to play a more notable rôle. With the assistance of his devoted adherents, Sir Henry Drummond Wolff, Sir John Gorst and occasionally of Mr Arthur Balfour, and one or two others, he constituted himself at once the audacious opponent of the Liberal administration and the unsparing critic of the Conservative front bench. The "fourth party," as it was nicknamed, was effective at first not so much in damaging the government as in awakening the opposition from the apathy which had fallen upon it after its defeat at the polls. Churchill roused the Conservatives and gave them a fighting issue, by putting himself at the head of the resistance to Mr Bradlaugh, the member for Northampton, who, though an avowed atheist and agnostic, was prepared to take the parliamentary oath. Sir Stafford Northcote, the Conservative leader in the Lower House, was forced to take a strong line on this difficult question by the energy of the fourth party, who in this case clearly expressed the views of the bulk of the opposition. The long and acrimonious controversy over Mr Bradlaugh's seat, if it added little to the reputation of the English legislature, at least showed that Lord Randolph Churchill was a parliamentary champion who added to his audacity much tactical skill and shrewdness. He continued to play a conspicuous part throughout the parliament of 1880–1885, dealing his blows with almost equal vigour at Mr Gladstone and at the Conservative front bench, some of whose members, and particularly Sir Richard Cross and Mr W. H. Smith, he assailed with extreme virulence. From the beginning of the Egyptian imbroglio Lord Randolph was emphatically opposed to almost every step taken by the government. He declared that the suppression of Arabi Pasha's rebellion was an error, and the restoration of the khedive's authority a crime. He called Mr Gladstone's Government "a Mikadoist Government," of whom torrents of blood had been shed in Africa. He was equally severe on the domestic policy of the administration, and was particularly bitter in his criticism of the Kilmainham treaty and the approachment between the Gladstonians and the Parnellites. It is true that for some time before the fall of the Liberals in 1885 he had considerably modified his attitude towards the Irish question, and was himself cultivating friendly relations with the Home Rule members, and even obtained from them the assistance of the Irish vote in the English constituencies in the general election. By this time he had definitely formulated the policy of progressive Conservatism which was known as "Tory democracy." He declared that the Conservatives ought to adopt, rather than oppose, reforms of a popular character, and to challenge the claims of the Liberals to pose as the champions of the masses. His views were to a large extent accepted by the official Conservative leaders in the treatment of the Gladstonian Franchise Bill of 1884. Lord Randolph insisted that the principle of the bill should be accepted by the opposition, and that resistance should be focused upon the refusal of the government to combine with it a scheme of redistribution. The prominent, and on the whole judicious and successful, part he played in the debates on these questions, still further increased his influence with the rank and file of the Conservatives in the constituencies. At the same time he was actively spreading the gospel of democratic Toryism in a series of platform campaigns. In 1883 and 1884 he invaded the Radical stronghold of Birmingham itself, and in the latter year took part in a Conservative garden party at Aston Manor, at which his opponents paid him the compliment of raising a serious riot. He gave constant attention to the party organization, which had fallen into considerable disorder after 1880, and was an active promotor of the Primrose League, which owed its origin to the happy inspiration of one of his own "fourth party" colleagues.

In 1884 the struggle between stationary and progressive Toryism came to a head, and terminated in favour of the latter. At the conference of the Central Union of Conservative Associations, Lord Randolph was nominated chairman, notwithstanding the strenuous opposition of the parliamentary leaders of the party. The split was averted by Lord Randolph's voluntary resignation; but the episode had confirmed his title to a leading place in the Tory ranks. It was further strengthened by the prominent part he played in the events immediately preceding the fall of the Liberal government in 1885; and when Mr Childers's budget resolutions were defeated by the Conservatives, aided by about half the Parnellites, Lord Randolph Churchill's admirers were justified in proclaiming him to have been the "organizer of victory." His services were, at any rate, far too important to be refused recognition; and in Lord Salisbury's cabinet of 1885 he was appointed to no less an office than that of secretary of state for India. During the few months of his tenure of this great post the young free-lance of Tory democracy surprised the permanent officials and his own friends by the assiduity with which he attended to his departmental duties and the rapidity with which he mastered the complicated questions of Indian administration. In the autumn election of 1885 he contested Central Birmingham against Mr Bright, and though defeated returned to Westminster, in which seat he had been returned for a very large majority for South Paddington. In the contest which arose over Mr Gladstone's Home Rule scheme, both in and out of parliament, Lord Randolph again bore a conspicuous part, and in the electioneering campaign his activity was only second to that of some of the Liberal Unionists, the marquess of Hartington, Mr Goschen and Mr Chamberlain. He was now the recognized Conservative champion in the Lower Chamber, and when the second Salisbury administration was formed after the general election of 1886 he became chancellor of the exchequer and leader of the House of Commons. His management of the House was on the whole successful, and was marked by tact, discretion and temper. But he had never really reconciled himself with some of his colleagues, and there was a good deal of friction in his relations with them, which ended with his sudden resignation on the 20th of December 1886. Various causes were alleged by those who took this surprising step. The only ostensible cause was that put forward in his letter to Lord Salisbury, which was read in the House of Commons on 27th January. In this document he stated that his resignation was due to his inability, as chancellor of the exchequer, to concur...
in the demands made on the treasury by the ministers at the head of the naval and military establishments. It was commonly supposed that he expected his resignation to be followed by the unconditional surrender of the cabinet, and his restoration to office on his own terms. The sequel, however, was entirely different. The cabinet was reconstructed with Mr Goschen as chancellor of the exchequer (Lord Randolph had "forgotten Goschen," as he is said to have remarked), and Churchill's own career as a Conservative chief was practically closed.

He continued, for some years longer, to take a considerable share in the proceedings of parliament, giving a general, though decidedly independent, support to the Unionist administration. On the Irish question he was a very candid critic of Mr Balfour's measures, and one of his later speeches, which recalled the acrimonious violence of his earlier period, was that which he delivered in 1890 on the report of the Parnell commission. He also fulfilled the promise made on his resignation by occasionally advocating the principles of economy and retrenchment in the debates on the naval and military estimates. In April 1889, on the death of Mr Bright, he was asked to come forward as a candidate for the vacant seat in Birmingham, and the result was a rather angry controversy with Mr Chamberlain, terminating in his being placed at the head of the Birmingham branch of the Independent Liberal party as the candidate for the representation of the Midland capital between Liberal Unionists and Conservatives. But his health was already precarious, and this, combined with the anomaly of his position, induced him to relax his devotion to parliament during the later years of the Salisbury administration. He bestowed much attention on society, travel and sport. He was an ardent supporter of the turf, and in 1889 he won the Oaks with a mare named the Abbé de Jouarre. In 1891 he went to South Africa, in search both of health and relaxation. He travelled for some months through Cape Colony, the Transvaal and Rhodesia, making notes on the politics and economics of the countries, shooting lions, and recording his impressions in letters to a London newspaper, which were afterwards republished under the title of Men, Mines and Animals in South Africa. He returned with renewed energy, and in the general election of 1892 once more flung himself, with his old vigour, into the strife of parties. His seat at South Paddington was uncontested; but he was active on the platform, and when parliament met he returned to the old position front bench and again took a leading part in debate, attacking Mr Gladstone's second Home Rule Bill with especial energy. But it was soon apparent that his powers were undermined by the inroads of disease. As the session of 1893 wore on his speeches lost their old effectiveness, and in 1894 he was listened to not so much with interest as with pity. His last speech in the House was delivered in the debate on Uganda in June 1894, and was a painful failure. He was, in fact, dying of general paralysis. A journey round the world was undertaken as a forlorn hope. Lord Randolph started in the autumn of 1894, accompanied by his wife, but the malady made so much progress that he was brought back in haste from Cairo. He reached England shortly before Christmas and died in London on the 24th of January 1895.

Lord Randolph Churchill married, in January 1874, Jennie, daughter of Mr Leonard Jerome of New York, U.S.A., by whom he had two sons. In 1900 Lady Randolph Churchill married Mr G. Cornwallis-West.

His elder son, WINTON CHURCHILL (1874- ), was educated at Harrow, and after serving for a few years in the army and acting as a special correspondent in the South African War (being taken prisoner by the Boers, Nov. 15, 1899, but escaping on Dec. 12), was elected Unionist member of parliament for Oldham in October 1900. As the son of his father, his political future excited much interest. His views, however, as to the policy of the Conservative party gradually changed, and having during 1904-1905 taken an active part in assisting the Liberal party in parliament, he stood for N.W. Manchester at the general election (1906) and was triumphantly returned as a Liberal and free-trader. He was made under-secretary for the colonies in the new Liberal government. In this position he became as conspicuous in parliament as he had already become on the platform as a brilliant and aggressive orator, and no politician of the day attracted more interest or excited more controversy. He was promoted to cabinet rank as president of the Board of Trade in Mr Asquith's government in April (1908), but was defeated at the consequent by-election in Manchester after a contest which aroused the keenest excitement. He was then returned for Dundee, and later in the year married Miss Clementine Hozier.

An interesting and authoritative biography of Lord Randolph, by his son Winston (who had already won his spurs as a writer in his River War, 1899, and other books on his military experiences), appeared in 1918; and another is Lord Rosebery, inspired by this biography, was published a few months later. Lord Randolph's earlier speeches were edited; with an introduction and notes, by Louis Jennings (2 vols., London, 1886). "Rulph T. H. Escott, Randolph Spencer Churchill (1895); H. W. Lucy, Diary of Two Parliaments (1892); and Mrs Cornwallis-West, The Reminiscences of Lady Randolph Churchill (i.e. of the author) (1908). (S. J. L.)

CHURCHILL (Mississippi or English), the name of a river of the province of Saskatchewan and district of Keewatin, Canada. It rises in La Loche (or Methyl) lake, a small lake in 58° 30' N. and 106° 30' W., at an altitude of 1577 ft. above the sea, and flows E.N.E. to Hudson's Bay, passing through a number of lakes and rapids and at one point forming a barrier to navigation (350 m. long), Sandy and Reindeer rivers. Between Frog and Methyl portages (480 m.) it formed part of the old voyageur route to the Peace, Athabasca, and Mackenzie. It is still navigated by canoes, but has many rapids. Its principal affluent, the Reindeer, discharges the waters of Reindeer Lake (1150 ft. above the sea, with an area of 2400 sq. m.) and Wollaston Lake (altitude, 1300 ft.). The Churchill is 925 m. long. Fort Churchill, at its mouth, is the best harbour in the southern portion of Hudson's Bay. The portage of La Loche (or Methyl), 125 m. in length, connects its head waters with the Clearwater river, a tributary of the Athabasca, draining into the Arctic Ocean.

CHURCHING OF WOMEN, the Christian ceremony of thanksgiving on the part of mothers shortly after the birth of their children. It no doubt originated in the Mosaic regulation as to purification (Lev. xii. 6). In ancient times the ceremony was usual but not obligatory in England. In the Greek and Roman Catholic Churches to-day it is imperative. The custom is first mentioned in the pseudo-Nicene Arabic Sermon of St muff, in which the Churches of the East, which figures in the English prayer-book of to-day dates only from the middle ages. Custom differs, but the usual date of churching was the forty-first day after confinement, in accordance with the Biblical date of the presentation of the Virgin Mary and the Child Jesus at the Temple. It was formerly regarded as unlucky for a woman to leave her house to go out at all after confinement till she went to be churched. It was not unusual for the churching service to be said in private houses. In Herefordshire it was not considered proper for the husband to appear in church at the service, or at all events in the same pew. In some parishes there was a special pew known as "the churching seat." The words in the rubric requiring the woman to come "decently appareled" refer to the times when it was thought unbecoming for a woman to come to the service with the elaborate head-dress then the fashion. A veil was usually worn, and in some parishes this was provided by the church, for an inventory of goods belonging to St Benet's, Gracechurch Street, in 1566, includes "A churching cloth, fringed, white damask."

The "convenient place," which, according to the rubric, the woman must occupy, was in pre-Reformation times the church-door. In the first prayer-book of Edward VI., she was to be "nigh unto the quire door." In the second of his books, she was to be "nigh unto the place where the Table standeth." Bishop Wren's orders for the diocese of Norwich in 1636 are "That women to be churched come and kneel at a side near the Com- munion Table without the rail, being veiled according to custom, and not covered with a hat." In Devonshire churching was sometimes called "being uprose." Churchings were formerly registered in some parishes. In pre-Reformation days it was the custom in England for women to carry lighted tapers when
being churched, in allusion to the Feast of the Purification of the Virgin (February 2nd), the day chosen by the Roman Catholic church for the blessing of the chdrad for the whole year (see CANDLES). At her churching a woman was expected to make some offering to the church, such as the chrisom or alb thrown over the child at christening.

CHURCH RATE, the name of a tax formerly levied in each parish in England and Ireland for the benefit of the parish church. Out of these rates were defrayed the expenses of carrying on divine service, repairing the fabric of the church, and paying the salaries of the officials connected with it. The church rates were made by the churchwardens, together with the parishioners duly assembled after proper notice in the vestry or the church. The rates thus made were recoverable in the ecclesiastical court, or, if the arrears did not exceed £10 and no questions were raised as to the legal liability, before two justices of the peace. Any payment not strictly recognized by law made out of the rate destroyed its validity. The church rate was a personal charge imposed on the occupier of land or of a house in the parish, and, though it was compulsory, much difficulty was found in effectually applying the compulsion. This was especially so in the case of Nonconformists, who had conscientious objections to the payment of anything to the Church of England, and in Ireland, where the population was preponderantly Roman Catholic, the grievance was specially felt and resented. The agitation against church rates led in 1868 to the passing of the Compulsory Church Rates Abolition Act. By this act church rates are no longer compulsory on the person rated, but are merely voluntary, and those who are not willing to pay them are excluded from inquiring into, objecting to, or voting in respect of their expenditure (s. 8).

CHURCHWARDEN, in England, the guardian or keeper of a church, and representative of the body of the parish. The name is derived from the original duty attached to the office, that of the custody or guardianship of the fabric and furniture of the church, which dates from the 14th century, when the responsibility of providing for the repairs of the nave, and of furnishing the utensils for divine service, was settled on the parishioners. Churchwardens are always lay persons, and as they may, like "artificial persons," hold goods and chattels and bring actions for them, they are recognized in law as quasi-corporations. Resident householders of a parish are those primarily eligible as churchwardens, and householders, not being occupiers, are not eligible, while there are a few classes of persons who are either ineligible or exempted. The appointment of churchwardens is regulated by the 5th canon, which requires that the churchwardens shall be chosen by the joint consent of the ministers and parishioners, if it may be; but if they cannot agree upon such a choice, then the minister is to choose one, and the parishioners another. If, however, there is any special custom of the place, the custom prevails, and the most common custom is for the minister to appoint one, and the parishioners another, and this has been established by English statute, in the case of new parishes, by the Church Building and New Parishes Acts 1818–1884. There are other special customs recognized in various localities, e.g. in some of the larger parishes in the north of England a churchwarden is chosen for each township of the parish; in the old ecclesiastical parishes of London both churchwardens are chosen by the parishioners; in some cases they are appointed by the select vestry, or by the lord of the manor, and in a few exceptional cases are chosen by the outgoing churchwardens.

In general, churchwardens are appointed in Easter week, usually Easter Monday or Easter Tuesday, but in new parishes the first appointment must be within twenty-one days after the consecration of the church, or two calendar months after the formation of the parish, subsequent appointments taking place at the usual time for the appointment of parish officers. Each churchwarden after election subscribes before the ordinary a declaration that he will execute his office faithfully.

The duties of churchwardens comprise the provision of necessities for divine service, so far as the church funds or voluntary subscriptions permit, the collecting the offertory of the congregation, the keeping of order during the divine service, and the giving of offenders into custody; the assignment of seats to parishioners; the guardianship of the movable goods of the church; the preservation and repair of the church and churchyard, the fabric and the fixtures; and the presentment of offences against ecclesiastical law.

In the episcopal church of the United States churchwardens discharge much the same duties as those performed by the English officials; their duties, however, are regulated by canons of the diocese, not by canons general. In the United States, too, the usual practice is for the parishes to elect both the churchwardens.

CHURCHYARD, THOMAS (c. 1520–1604), English author, was born at Shrewsbury about 1520, the son of a farmer. He received a good education, and, having speedily dissipated at court the money with which his father provided him, he entered the household of Henry Howard, earl of Surrey. There he remained for four years, learning something of the art of poetry from his patron; some of the poems he contributed later (1557) to Songs and Sonnets, may very well date from this early period. In 1547 he began his career as a soldier of fortune, being, he said, "pressed into the service." He fought his way through nearly every campaign in Scotland and the Low Countries for thirty years. He served under the emperor Charles V. in Flanders in 1542, returning to England after the peace of Crécy (1554). In the Scottish campaign of 1547 he was present at the barren victory of Pinkie, and in the next year was taken prisoner at Saint Monance, but aided by his persuasive tongue he escaped to the English garrison at Lauder, where he was once more besieged, only returning to England on the conclusion of peace in 1550. A broadside entitled Davy Dycors Dreame, a short and seemingly alliterative poem in the manner of Piers Plowman, brought him into trouble with the privy council, but he was dismissed with a reprimand. This tract was the starting-point of a controversy between Churchyard and a certain Thomas Camel. The whole of the "Flying" was reprinted in 1560 as The Contention betwixt Churchyard and Camel. The 1550 book went to Ireland, to which the lord deputy, Sir Anthony St Leger, who had been sent to pacify the country. Here Churchyard enriched himself at the expense, it is to be feared, of the unhappy Irish; but in 1552 he was in England again, trying vainly to secure a fortune by marriage with a rich widow. After this failure he departed once more to the wars to the siege of Metz (1552), and "trailing a pike" in the emperor's army, until he joined the forces under William, Lord Grey of Wilton, with whom he says he served eight years. Grey was in charge of the fortress of Gaines, which was besieged by the duke of Guise in 1558. Churchyard arranged the terms of surrender, and was sent with his chief to Paris as a prisoner. He was not released at the peace of Cateau Cambresis for lack of money to pay his ransom, but he was finally set free on giving his bond for the amount, an engagement which he repudiated as soon as he was safely in England. He is not to be identified with the T. C. who wrote for the Mirror for Magistrates (ed. 1550), "How the Lord Mowbray . . . was banished . . . and after died miserably in exile," and the work of Thomas Chaloner, but "Shore's Wife," his most popular poem, appeared in the 1563 edition of the same work, and to that of 1587 he contributed the "Tragedie of Thomas Wolsey." These are plain many compositions in the seven-lined Chaucerian stanza. Repeated petitions to the queen for assistance produced at first fair words, and then no answer at all. He therefore returned to active service under Lord Grey, who was in command of an English army sent (1560) to help the Scottish rebels, and in 1564 he served in Ireland under Sir Henry Sidney. The religious disturbances in the Netherlands attracted him to Antwerp, where as the agent of William of Orange he allowed the insurgents to place him at their head, and was able to save much property from destruction. This action made him so hated by the mob that
he had to fly for his life in the disguise of a priest. In the next year he was sent by the earl of Oxford to serve definitely under the prince of Orange. After a year's service he obtained leave no return to England, and after many adventures and narrow escapes in a journey through hostile territory he embarked for Guernsey, and thence for England. His patron, Lord Oxford, disowned him, and the poet, whose health was failing, retired to Bath. He appears to have made a very unhappy marriage at this time, and returned to the Low Countries. Falling into the hands of the Spaniards he was recognized as having had a hand in the Antwerp disturbance, and was under sentence to be executed as a spy when he was saved by the intervention of a noble lady. This experience did not deter him from joining in the defence of Zutphen in 1572, but this was his last campaign, and the troubles of the remaining years of his life were chiefly domestic.

Churchyard was employed to devise a pageant for the queen's reception at Bristol in 1574, and again at Norwich in 1578. He had published in 1575 The firste parte of Churchyarde's Chippes, the modest title which he gives to his works. No second part appeared, but there was a much enlarged edition in 1578. A passage in Churchyarde's Chippes (1579) gave offence to Elizabeth, and the author fled to Scotland, where he remained for three years. He returned in 1580, and was restored to his pension in 1593, but he received a small pension from the queen. The affectionate esteem with which he was regarded by the younger Elizabethan writers is expressed by Thomas Nashe, who says (Four Letters Confuted) that Churchyard's aged muse might well be "grandmother to our grandiloquentest poets at this present."

Francis Meres (Palladis Tamia, 1598) mentions him in conjunction with many great names among "the most passionate, among us, to bewail and bemoan the perplexities of love." Spenser, in "Colin Clout's come home again," calls him with a spice of raillery "old Palamen" who "sung so long until quite hoarse he grew." His writings, with the exception of his contributions to the Mirror for Magistrates, are chiefly autobiographical in character or deal with the wars in which he had a share. They are very rare, and have never been completely reprinted. Churchyard lived right through Elizabeth's reign, and was buried in St Margaret's church, Westminster, on the 4th of April 1604.

The extant works of Churchyard, exclusive of commendatory and occasional verses, include:—A lamentable and pitiful Description of the life and death of Mr. Francis Churchyard (ed. J. P. Collier, 1870), a rehearsal of a war, called Churchyard's Chippes (1579), a completion of the Chippes, and containing, like it, a number of detached pieces: A light Bondel of twelve Discourses, called Churchyardes Charge (1583). A first edition of the Works was published in 1593 by the antiquarian work in prose and verse, anticipating Michael Drayton; Churchyard's Challenge (1593); A Musickal Consort of Heavenly harmonie ... called Churchyards Charlie (1595); A True Discourse Historiell, of the succeeding Governors in the Netherlands (1602).

The chief authority for Churchyard's biography is his own "Tragicall Discourse of the unhappy man's life" (Churchyared Chippes). George Chalmers published (1817) a selection from his works relating to Scotland, for which he wrote a useful Life of the author (ed. J. P. Collier, 1870), of the Worthines of Wales (Spenser Soc. 1876), and a notice of Churchyard by H. W. Adnitt (Transactions of the Shropshire Archaeological and Nat. Hist. Soc., reprinted separately 1884).

CHURCHYARD, a piece of consecrated ground attached to a parochial church, and used as a burial place. It is distinguished from a cemetery (q.v.), which is also a place of burial, but is separate and apart from any parochial church. A cemetery in England is either the property of a private company, incorporated by special act of parliament, or of a local authority, and is subject to the Cemeteries Clauses Act 1847, incorporated in the Public Health Acts. The practice of burying in churches or churchyards is said to have been connected with the custom of praying for the dead, and it would appear that this practice was burying in the church itself. In England, about the year 750, spaces of ground adjoining the churches were enclosed and appropriated to the burial of those who had been entitled to attend divine service in those churches.

The right to burial in the parish churchyard is a common law right, controlled in many points by the provisions of the law ecclesiastical. This double character is sufficient to explain the controversy which has so long raged round the subject of burials in England. Every man, according to the common law, has a right to be buried in his own churchyard, or, as it is sometimes put, in the churchyard of the parish where he dies. But the churchyard, as well as the church itself, is the freehold of the parson, who can in many respects deal with it as if it were a private estate. A statute of Edward I. (35, st. 2) speaks of the churchyard as the soil of the church, and the trees growing in the churchyard "as amongst the goods of the church, the which laymen have no authority to dispose," and prohibits "the parsons from cutting down such trees unless required for repairs." Notwithstanding the consecration of the church and churchyard and the fact that they are the parson's freehold, a right of way, may be claimed through them by prescription. The right to burial may be subject to the payment of a fee to the incumbent, if such has been the immemorial custom of the parish, but not otherwise. The spirit of the ancient canons regarded such burial fees as of a simoniacal complexion, inasmuch as the consecrated grounds were among the res sacrae—a feeling which Lord Stowell says disappeared after the Reformation. No person can be buried in a church without the consent of the incumbent, except when the owner of a manor-house prescribes for a burying-place in the churchyard. In the case of Crouch End, the 16th of Res v. Taylor it was held that an information was not punishable against a person for opposing the burial of a parishioner; but the court would not interpose as to the person's refusal to read the burial service because he never was baptized—that being matter for the ecclesiastical court. Strangers (or persons not dying in the parish) should not be buried, it appears, without the consent of the parishioners or churchwardens, "whose parochial right of burial is invaded thereby."

In Scotland the obligation of providing and maintaining the churchyard rests on the heritors of the parish. The guardianship of the churchyard belongs to the heritors and also to the kirk-session, either by delegation from the heritors, or in right of its ecclesiastical character. The right of burial appears to be strictly limited to parishioners, although an opinion has been expressed that any person dying in the parish has a right to be buried in the churchyard. The parishioners have no power of management. The presbytery may interfere to compel the heritors to provide due accommodation, but has no further jurisdiction. It is the duty of the heritors to allocate the churchyard. The Scottish law hesitates to attach the ordinary incidents of real property to the churchyard. The English law treated the churchyard as the parson's freehold. It would be difficult to say who in Scotland is the legal owner of the soil. Various opinions appear to prevail, e.g. as to grass growing on the surface and minerals found beneath. The difficulty as to religious services does not exist. On the other hand, the religious character of the ground is hostile to many of the legal rights recognized by the English law.

See also BURIAL AND BURIAL ACTS; CEMETERY.

CHURL (A.S. cœrl, cognate with the Ger. Keri and with similar words in other Teutonic languages), one of the two main classes, cœrl and cœl, into which in early Anglo-Saxon society the freemen appear to have been divided. In the course of time the status of the cœrl was probably reduced; but although his political power was never large, and in some directions his freedom was restricted, it hardly seems possible previous to the Norman Conquest to class him among the unfree. Some authorities, however, accept this view. At all events it is certain that the cœrl was frequently a holder of land, and a person of some position, and that he could attain the rank of a thegn. Except in Kent his wergild was fixed at two hundred shillings, or one-fifth of that of a thegn, and he is undoubtedly the man of Anglo-Saxon law. In Kent his wergild was considerably higher, and his status probably also, but his position in this kingdom is a matter of controversy. After the Norman Conquest the cœlrs were reduced to a condition of serfdom, and the word translates the villanus of Domesday Book, although it also covers classes other than the villani. The form cœrl soon became churl, as in Havrok the Dane (ante 1300) and several times in Chaucer.
and subsequently churn. Taking a less technical sense than the coel of Anglo-Saxon law, churl, or cherl, was used in general to mean "a man," and more particularly a "husband." In this sense it was employed about 1000 in a translation of the New Testament to render the word ἄρχω (John iv. 16, 17). It was then employed to describe a "peasant," and gradually began to denote undesirable qualities. Hence comes the modern use of the word for a low-born or vulgar person, particularly one with an unpleasant, surly or mischievous character.

See H. M. Chadwick, Studies on Anglo-Saxon Institutions (Cambridge, 1905); F. Seebohm, Tribal Custom in Anglo-Saxon Law (London, 1902).

CHURN (O. Eng. cyren; found in various forms in most Teutonic languages, cf. Dutch karm; according to the New English Dictionary not connected with "quern," a mill), a vessel in which butter is made, by shaking or beating the cream so as to separate the fatty particles which form the butter from the serous parts or buttermilk. Early churns were upright, and in shape resembled the cans now used in the transport of milk, to which the name "churn" is also given. The upright churn was knocked by hand by a wooden "plunger"; later came a box-shaped churn with a "splasher" revolving inside and turned by a handle. The modern type of churn, in large dairies worked by mechanical means, either revolves or swings itself, thus reverting to the most primitive method of butter-making, the shaking or swinging of the cream in a skin-bag or a gourd. (See Diary.)

CHUSAN, the principal island of a group situated off the eastern coast of China, in 30° 12'' E., belonging to the province of Cheh-kiang. It lies N.W. and S.E., and has a circumference of 51 m., the extreme length being 29, the extreme breadth 10, and the minimum breadth 6 m. The island is beautifully diversified with hill and dale, and well watered with numerous small streams, of which the most considerable is the Tungkiang, falling into the harbour of Tinghai. Most of the surface is capable of cultivation, and nineteen-twentieths of the island are now under cultivation. Wherever it is possible to rear rice every other product is neglected; yet the quantity produced is not sufficient for the wants of the inhabitants. Millet, wheat, sweet potatoes, yams and tares are also grown. The tea plant is found almost everywhere, and the cotton plant is largely cultivated near the sea. The capital, Tinghai, stands about half a mile from the southern shore, and is surrounded by a wall nearly 3 m. in circuit. The ditch outside the wall is interrupted on the N.W. side by a spur from a neighbouring hill, which projects into the town, and forms an easy access to an attacking force. The town is traversed by canals, and the harbour, which has from 4 to 8 fathoms water, is landlocked by several islands. Temple (or Joss-house) Hill, which commands the town and harbour close to the beach, is 122 ft. high. The population of the entire island is estimated at 250,000, of which the capital contains about 40,000. Chusan has but few manufactures; the chief are coarse cotton stuffs and agricultural implements. There are salt-works on the coast, and the fisheries employ a number of the inhabitants. In Tinghai a considerable business is carried on in carving and varnishing, and its silver wares are in high repute. The principal exports are fish, coarse black tea, cotton, vegetable tallow, sweet potatoes, and some wheat. Chusan was occupied by the Japanese during the Ming dynasty, and served as an important commercial entrepôt. It was taken by the British forces in 1840 and 1841, and retained till 1846 as a guarantee for the fulfilment of the stipulations of the treaty. It was also occupied by the British in 1856.

CHUT (Fr. for "fall," of water or the like; pronounced as "shut," with which in meaning it is identical), a channel or trough, artificial or natural, down which objects such as timber, coal or grain may slide from a higher to a lower level. The word is also used of a channel cut in a dam or a river for the passage of floating timber, and in Louisiana and on the Mississippi of a channel at the side of a river, or narrow way between an island and the shore. The "Water-Chute" or water tobogganing, is a

Canadian pastime, which has been popular in London and elsewhere. A steep wooden slope terminates in a shallow lake; down this run flat-bottomed boats, his hands free, and increasing their velocity until at the end of the "chute" they dash into the water.

CHUTNEY, or CHUTNEE (Hindustani chutni), a relish or seasoning of Indian origin, used as a condiment. It is prepared from sweet fruits such as mangoes, raisins, &c., with acid flavouring from tamarinds, lemons, limes and sour herbs, and with a hot seasoning of chillies, cayenne pepper and spices.

CHUVASHES, or TCHUVASHES, a tribe found in eastern Russia. They form about one-fourth of the population of the government of Kazan, and live in scattered communities throughout the governments of Simbirsk, Samara, Saratov, Orenburg and Perm. They have been identified with the Burtasses of the Arab geographers, and many authorities think they are the descendants of the ancient Bolgars. In general they physically resemble the Finns, being round-headed, flat-featured and light-eyed, but they have been affected by long association with the Tatar element. In dress they are thoroughly Russianized, and they are nominally Christians, though they cling to many of the Old Shamanistic practices. They are usually called a mixture of their two primitive parents. The language belongs to the Tatar or Turkish group, but has been strongly influenced by the Finno-Ugrian idioms spoken round it. See Schott, De Lingua Tschuwaschorum (Berlin, 1841).

CIALDINI, ENRICO (1817-1892), Italian soldier, politician and diplomatist, was born at Castelvetro, in Modena, on the 10th of August 1817. In 1831 he took part in the insurrection at Modena, fleeing afterwards to Paris, whence he proceeded to Spain to fight against the Carlists. Returning to Italy in 1848, he commanded a regiment at the battle of Novara. In 1850 he organized the Alpine Brigade, fought at Palestro at the head of the 4th Division, and in the following year invaded the Marches, and won the battle of Castelfidardo, took Ancona, and subsequently directed the siege of Gaeta. For these services he was created duke of Gaeta by the king, and was assigned a pension of 10,000 lire by parliament. In 1861 his intervention envenomed the Garibaldian dispute, royal mediation alone being able to avert a duel between him and Garibaldi. Placed in command of the troops sent to oppose the Garibaldian expedition of 1862, he defeated Garibaldi at Aspromonte. Between 1862 and 1865 he held the position of lieutenant-royal at Naples, and in 1864 he was created senator. On the outbreak of the war of 1866 he resumed command of an army corps, but dissensions between him and La Marmora prejudiced the issue of the campaign and contributed to the defeat of Custozza. After the war he refused the command of the General Staff, which he wished to render independent of the war office. In 1867 he attempted unsuccessfully to form a cabinet sufficiently strong to prevent the threatened Garibaldian incursion into the papal states, and two years later failed in a similar attempt, through disagreement with Lanza concerning the army estimates. On the 3rd of August 1870 he pleaded in favour of Italian intervention in aid of France, a circumstance which enhanced his influence when in July 1876 he replaced Nizza as ambassador to the French Republic. This position he held until 1882, when he resigned on account of the publication by Mancini of a despatch in which he had complained of arrogant treatment by M. Waddington. He died at Leghorn, on the 8th of September 1892.

CIBBER (or CIBERT), CAJUS GABRIEL (1653-1700), Danish sculptor, was born at Flensburg. He was the son of the king's cabinetmaker, and was sent to Rome at the royal charge while yet a youth. He came to England during the Protectorate, or during the first years of the Restoration. Besides the famous statues of Melancholy and Raving Madness ("great Cibber's brazen brainless brothers"), now at South Kensington, Cibber produced the bas-reliefs round the monument on Fish Street Hill. The several kings of England and the Sir Thomas Gresham executed by him for the Royal Exchange were destroyed with the building itself in 1838. Cibber was long employed by the fourth earl of Devonshire, and many fine specimens of his work are to be seen at Chatsworth. Under that nobleman he took up arms in 1688 for William of Orange, and was appointed in return carver to the
kin's closet. He died rich, and, according to Horace Walpole, built the Danish church in London, where he lies buried beside his second wife, to whom he erected a monument. She was a Miss Colley of Glaston, grand-daughter of Sir Anthony Colley, and the mother of his son Colley Cibber.

CIBBER, COLLEY (1671-1757), English actor and dramatist, was born in London on the 6th of November 1671, the eldest son of Caius Gabriel Cibber, the sculptor. Sent in 1682 to the free school at Grantham, Lincolnshire, the boy distinguished himself by an aptitude for writing verse. He produced an "Oration" on the death of Charles II.—whom he had seen feeding his ducks in St James's Park,—and an "Ode" on the accession of James II. He was removed from school in 1687 on the chance of election to Winchester College. His father, however, had not then presented that institution with his statue of William of Wykeham, and the son was stayed, although through his mother he claimed to be of "founder's kin." The boy went to London, and indulged his passion for the theatre. He was invited to Chatsworth, the seat of William Cavendish, earl (afterwards duke) of Devonshire, for whom his father was then executing commissions, and he was on his way when the news of the landing of William of Orange was received; father and son met at Nottingham, and Colley Cibber was taken into Devonshire's company of volunteers. He served in the bloodless campaign that resulted in the coronation of the Prince of Orange, and on its conclusion presented a Latin petition to the earl imploring his interest. The earl did nothing for him, however, and he enrolled himself (1690) as an actor in Betterton's company at Drury Lane.

After playing "full three-quarters of a year" without salary, as was then the custom of all apprentice actors, he was paid ten shillings a week. His rendering of the little part of the chaplain in Otway's Orphan procured him a rise of five shillings; and a subsequent impeachment (1694) on an emergency, and at the author's request, of Lord Touchwood in The Double Dealer, advanced him, on Congreve's recommendation, to a pound a week. On this, supplemented by an allowance of £20 a year from his father, he contrived to live with his wife and family— he had married in 1693—and to produce a play, Love's Last Shift, or the Boot in Fashion (1696). Of this comedy Congreve said that it had "a great many things that were like wit in it"; and Vanbrugh honoured it by writing its Relapse as a sequel. Cibber played the part of Sir Novelty Fashion, and his performance as Lord Foppington, the same character renamed, in Vanbrugh's The Relapse, was so admired that it put him under whose management Drury Lane became more prosperous than it ever had been.

In 1715 a new patent was granted to Sir Richard Steele, and Barton Booth was also added to the management. In 1717 Cibber produced the Nonjuror, an adaptation from Molière's Tartuffe; the play, for which Nicholas Rowe wrote an abusive prologue, ran eighteen nights, and the author received from George I., to whom it was dedicated, a present of two hundred guineas. Tartuffe became an English Catholic priest who incited rebellion, and there is little doubt that the Whig principles expressed in the Nonjuror led to Cibber's appointment as poet laureate (1730). It also provoked the animosity of the Jacobite and Catholic factions, and was possibly one of the causes of Pope's hostility to Cibber. Numerous "keys" to the Nonjuror appeared in 1718. In 1720 Drury Lane was closed for three days by order of the duke of Newcastle, ostensibly on account of the refusal of the patentees to submit to the authority of the lord chamberlain, but really (it is asserted) because of a quarrel between Newcastle and Steele, in which the former demanded Cibber's resignation. In 1726 Cibber pleaded the cause of the patentees against the estate of Sir Richard Steele before Sir Joseph Jekyll, master of the rolls, and won his case. In 1730 Mrs Oldfield died, and her loss was followed in 1732 by that of Wilks; Cibber now sold his share in the theatre, appearing rarely on the stage thereafter. In 1740 he published An Apology for the Life of Colley Cibber, Comedian . . . with an Historical View of the Stage during his Own Time. "There are few," wrote Goldsmith, "who do not prefer a page of Montaigne or Colley Cibber, who candidly tell us what they thought of the world, and the world thought of them, to the more stately memoirs and transactions of Europe." But beside the personal interest, this book contains criticisms on acting of enduring value, and gives the best account there is of Cibber's contemporaries on the London stage. Samuel Johnson, who was no friend of Cibber, gave it grudging praise (see Boswell's Life of Johnson, ed. Birkbeck Hill, vol. iii. p. 72).

In 1742 Cibber was substituted for Theobald as the hero of Pope's Dunciad. Cibber had introduced some gag into the Rehearsal, in which he played the part of Bayes, referring to the ill-starred farce of Three Hours after Marriage (1717). This play was nominally by Gay, but Pope and Arbuthnot were known to have had a hand in it. Cibber refused to discontinue the offensive passage, and Pope revenged himself in sarcastic allusions in his printed correspondence, in the Epistle to Dr Arbuthnot and in the Dunciad. In the latter, Cibber replied with A Letter from Mr Cibber to Mr Pope, insinuating into the notices that might induce him to his satirical works to be so frequently fond of Mr Cibber's name (1742). Cibber scored with an "idle story of Pope's behaviour in a tavern" inserted in this letter, and gives an account of the original dispute over the Rehearsal. By the substitution of Cibber for Theobald as hero of the Dunciad, much of the satire lost its point. Cibber's faults certainly did not include dullness. A new edition contained a prefatory discourse, probably the work of Warburton, entitled "Richardus Aristarchus, or the Hero of the Poem," in which Cibber is made to look ridiculous from his own Apology. Cibber replied in 1744 with Another Occasional Letter . . . , and altogether he had the best of the argument. When he was seventy-four years old he made a brilliant appearance in Pope's Essay on Man, as the Emperor of Papal Tyranny in the Reign of King John (Covent Garden, 15th of February 1745), a miserable paraphrase of Shakespeare's play. He died on the 11th of December 1757.

Cibber's reputation has suffered unduly from the depreciation of Pope and Johnson. "I could not bear such nonsense," said Johnson of one of Cibber's odes, "and I would not let him read it to the end." Fielding attacked Cibber's style and language more than once in Joseph Andrews and elsewhere. Nevertheless, Cibber possessed wit, unusual good sense and tact; and in the Apology he showed himself the most delicate and subtle critic of acting of his time. He was frequently accused of plagiarism, and did not scruple to make use of old plays, but he is said to have been afeared of his Shakespearean adaptations, one of which, The Miser, his own Falstaff in the Reign of King John (Covent Garden, 15th of February 1745), a miserable paraphrase of Shakespeare's play. He died on the 11th of December 1757.

He died on the 11th of December 1757. If Cibber had not as much wit as his predecessors, he displayed in his best plays abundant animation and spirit, free from the extreme coarseness of many of his contemporaries, and a thorough knowledge of the requirements of the stage. His most successful comedies kept their place in the acting repertory for a long time. He was an excellent actor, especially in the rôle of the fashionable coxcomb. Horace Walpole said that as Bayes in The Rehearsal he made the part it was intended to be, the burlesque of a great poet, whereas David Garrick degraded him to a "garrettier."
by R. W. Lowe, who printed it with other valuable theatrical books and pamphlets. It is also included in Hunt and Clarke's "Autobiographies" (1826, &c.). Cibber's "Dramatic Works" were published in 1766, with an account of the lives and writings of the author, and again in 1777. Besides the plays already mentioned, John "The Woman's Will, or the Lady in Fashion" (1697), which was altered later (1707) into "The Schoolboy, or the Comical Rivals; Xeres" (1699), a tragicomedy acted only once; The Provoked Husband (acted 1726), contributed from Vanbrugh's unfinished Journey to London; The Rival Queens, with the Humours of Alexander the Great (acted 1710), a comical tragedy; "Damon and Phylida" (acted 1729), a ballad opera; and adaptations from Beaumont and Fletcher, Dryden, and others. A bibliography of the numerous skits on Cibber is to be found in Lowe's "Biographical Account of English Theatrical Literature." Colley Cibber's son, Theophilus Cibber (1703-1758), also an actor and playwright, was born on the 26th of November 1703. In 1734 he was acting-manager at the Haymarket, and he subsequently played at Drury Lane, Lincoln's Inn Fields and Covent Garden. His best impersonation was as Pistol, but he also distinguished himself in some of the fine-gentleman parts affected by his father. He was one of the ringleaders in the intrigue against John Highmore, who had been given a share in the patent of Drury Lane from Colley Cibber. Theophilus Cibber, with a number of other actors, seceded from Drury Lane, and in thus depreciating the value of the patent, for which his father had received a considerable sum, acted with doubtful honesty. He contemplated the publication of an autobiography, but was effectually dissuaded by the appearance (1740) of a scathing account of his career by an unknown author, entitled An Apology for the Life of Mr T. . . . C. . . . supposed to be written by himself. In 1753 he began The Lives and Characters of the most Eminent Actors and Actresses of Great Britain and Ireland, but he went no further than the life of Barton Booth. He wrote some plays of no great merit. In 1753 appeared An Account of the Lives of the Poets of Great Britain and Ireland, with the name of "Mr Cibber" on the title page. The five volumes of Lives are chiefly based on the earlier works of Gerard Langbaine and Giles Jacob, and the MS. collections of Thomas Coxeter (1640-1701). The book is said to have been largely written by Robert Shilton, Dr Johnson's amanuensis. Theophilus Cibber perished by shipwreck on his way to Dublin to play at the Theatre Royal.

Susannah Maria Cibber (1714-1766), wife of Theophilus, was an actress of distinction. She was the daughter of a Covent Garden upholsterer, and sister of Dr Arne (1710-1778) the composer. Mrs Cibber had a beautiful voice and began her career in opera. She was the original Galatea in Handel's "Acis and Galatea", and the contralto arias in the Messiah are said to have been written for her. She played Zarah in Aaron Hill's version of Voltaire's "Zaire" in 1736, and it was as a tragic actress, not as a singer, that her greatest triumphs were won. From Colley Cibber she learned a song-sing method of declamation. Her mannerisms, however, did not obscure her real genius, and she freed herself from them entirely when she began to act with Garrick, with whom she was associated at Drury Lane from 1753. She died on the 23rd of October 1766. She married Theophilus Cibber in 1754, but lived with him but a short time. Appreciations of Mrs Cibber's fine acting are to be found in many contemporary writers, one of the most discriminating being in the "Rosciad" of Charles Churchill.

Colley Cibber's youngest daughter, Charlotte, married Richard Charke, a violinist, from whom she was soon separated. She began as an understudy to actresses in leading parts, but quarrelled with her manager, Charles Fleetwood, on whom she wrote a one-act skit, The Art of Management (1735). She also wrote two comedies and two novels of small merit, and an untrustworthy, but amusing Narrative of Life of . . . Charlotte Charke, . . . by herself (1753), reprinted in Hunt and Clarke's "Autobiographies" (1822).

CIBORIUM, a name in classical Latin for a drinking-vessel. It is the latinized form of the Gr. κιβοριον, the cup-shaped seed-vessel of the Egyptian water-lily, the seeds or nuts of which were known as "Egyptian beans." In the early Christian Church the ciborium was a canopy over the altar (νάστυμν), supported on columns, and from it hung the receptacle in which was reserved the consecrated wafer of the Eucharist. The use of the word has probably been much influenced by the early false connexion with cibus, food, cf. Agatior, bishop of Pisa (quoted in Du Cange, Gloss. s.v.), "Ciborium vas esse ad ferendos cibos." In the Eastern Church the columns rested on the altar itself, in the Western they reached the ground. The name was early transferred from the canopy to the vessel containing the reserved sacrament, and in the Western Church the canopy was known as a " baldacain," Ital. baldacchino, from Baldassaro, the Italian name of Bagdad, and hence applied to a rich kind of embroidered tapestry made there and much used for canopies, &c. At the present day it is usual in the Roman Church to use the term "pyx" (πύξις, properly a vessel made of boxwood) for the receptacle for the reserved sacrament used in administering the viaticum to the sick or dying. Medieval pyxes and ciboria are often beautiful examples of the goldsmith's, enameller's and metal-worker's craft. They take most usually the shape of a covered chalice or of a cylindrical vessel provided with a cover. An ex-libris ciborium fetched £6000 at the sale of the Jerdone Brakenridge collection at Christie's in 1908. It is supposed to have come from Malmsbury Abbey, and is probably of 13th-century English make. It is of copper-gilt and ornamented with champlevé enamels, apple and chrysoprase green, scarlet, mauve and white, turquoise and lapis lazuli, the flesh tints being of a pale jasper. Various subjects from the Old and New Testament, such as the sacrifice of Abel, the brazen serpent, the nativity, crucifixion and resurrection are represented on circular medallions on the outside. It is illustrated in colours in the catalogue of the exhibition of the Burlington Fine Arts Club, 1897.

CIBRARIO, Luigi, Count (1802-1870), Italian statesman and historian, descended from a noble but impoverished Piedmontese family, was born in Ussuglia on the 23rd of February 1802. He won a scholarship at the age of sixteen, and was teaching literature at eighteen. His verses to King Charles Albert taught then prince of Carignano, on the birth of his son Victor Emmanuel, attracted the prince's attention and proved the beginning of a long intimacy. He entered the Sardinian civil service, and in 1824 was appointed lecturer on canon and civil law. His chief interest was the study of ancient documents, and he was sent to search the archives of Switzerland, France and Germany for charters relating to the history of Savoy. During the war of 1848, after the expulsion of the Austrians from Venice, Cibario was sent to that city with Colli to negotiate its union with Piedmont. But the proposal fell through when the news of the armistice between King Charles Albert and Austria arrived, and the two delegates were made the objects of a hostile demonstration. In October 1848 Cibario was made senator, and after the battle of Novara (March 1849), when Charles Albert abdicated and retired to a monastery near Oporto, Cibario and Count Giacinto di Collolo were sent as representatives of the senate to express the sympathy of that body with the new king. They received the new king in May, and after staying there for a month returned to Turin, just before the news of Charles Albert's death. In May 1852 he became minister of finance in the reconstructed d'Azeglio cabinet, and later minister of education in that of Cavour. In the same year he was appointed secretary to the order of SS. Maurizio and Lazzaro. It was he who in 1853 dictated the vigorous memorandum of protest against the confiscation by Austria of the property of Lombard exiles who had been naturalized in Piedmont. He strongly supported Cavour's Crimean policy (1853), and when General La Marmora departed in command of the expeditionary force and Cavour took the war office, Cibario was made minister for foreign affairs. He conducted the business of the department with great skill, and ably seconded Cavour in bringing about the admission of Piedmont to the congress of Paris on an equal footing with the great powers. On retiring from the foreign office Cibario was created count. In 1860 he acted as mediator between Victor Emmanuel's
government and the republic of San Marino, and arranged a treaty by which the latter's liberties were guaranteed. After the war of 1866 by which Austria lost Venetia, Cibrario negotiated with that government for the restitution of state papers and art treasures removed by it from Lombardy and Venetia to Vienna. He died in October 1870, near Salò, on the lake of Garda.

His most important work was his Economia politica del medio evo (Turin, 1839), which enjoyed great popularity at the time, but is now of little value. His Schicida e seraggio (Milan, 1868-1869) gave an account of the development and abolition of slavery and servitude. Among his historical writings the following deserve mention:—Delle artiglierie dal 1300 al 1700 (Turin, 1847); Origini . . . della monarchia di Savoia (Turin, 1854); Degli ordini cavallereschi (Turin, 1850); Degli ordini religiosi (Turin, 1843); and the Memorie Segrete of Charles Albert, written by order of Victor Emmanuel but afterwards withdrawn. Cibrario was a good example of the loyal, industrious, honest Piedmontese aristocrat of the old school.

His biography has been written by F. Odorici, Il Conte L. Cibrario (Florence, 1872). (L. V.)

CICADA (Cicadidae), insects of the homopterous division of the Hemiptera, generally of large size, with the femora of the anterior legs toothed below, two pairs of large clear wings, and prominent compound eyes. Cicadas are chiefly remarkable for the shrill song of the males, which in some cases may be heard in concert at a distance of a quarter of a mile or more. The vocal organs, of which there is a pair in the thorax, protected by an opercular plate, are quite unlike the sounding organs of other insects. Each consists in essence of a tightly stretched membrane or drum which is thrown into a state of rapid vibration by a powerful muscle attached to its inner surface and passing thence downwards to the floor of the thoracic cavity. Although no auditory organs have been found in the females, the song of the male is believed to serve as a sexual call. Cicadas are also noteworthy for their longevity, which so far as is known surpasses that of all other insects. By means of a saw-like ovipositor the female lays her eggs in the branches of trees. Upon hatching, the young, which differ from the adult in possessing long antennae and a pair of powerful fossorial anterior legs, fall to the ground, burrow below the surface, and spend a prolonged subterranean larval existence feeding upon the roots of vegetation. After many years the larva is transformed into the pupa or nymph, which is distinguishable principally by the shortness of its antennae and the presence of wing pads. After a brief existence the pupa emerges from the ground, and, holding on to a plant stem by means of its powerful front legs, sets free the perfect insect through a silt along the median dorsal line of the thorax. In some cases the pupa upon emerging constructs a chimney of soil, the use of which is not known. In one of the best-known species, Cicada septemdecim, from North America, the life-cycle is said to extend over seventeen years. Cicadas are particularly abundant in the tropics, where the largest forms are found. They also occur in temperate countries, and were well known to the ancient Greeks and Romans. One species only is found in England, where it is restricted to the southern counties but is an insect not commonly met with.

CICELY, Myrrhis odorata (natural order Umbelliferae), a perennial herb with a leafy hollow stem, 2 to 3 ft. high, much divided leaves, whitish beneath, a large sheathing base, and terminal umbels of small white flowers, the outer ones only of which are fertile. The fruit is dark brown, long (§ to 1 in.), narrow and beaked. The plant is a native of central and southern Europe, and is found in parts of England and Scotland in pastures, usually near houses. It has aromatic and stimulant properties and is sometimes used as a pot-herb.

CICERO, the name of two families of ancient Rome. It may perhaps be derived from cicer (pulse), in which case it would be analogous to such names as Lentulus, Tabulo, Pico. Of one family, of the plebeian Claudian gens, only a single member, Gaius Claudius Cicero, tribune in 454 B.C., is known. The other family was a branch of the Tullii, settled from an ancient period at Arpinum. This family, four of whose members are noticed specially below, did not achieve more than municipal eminence until the time of M. Tullius Cicero, the great orator.

1. MARCUS TULLIUS CICERO (106-43 B.C.), Roman orator and politician, was born at Arpinum on the 3rd of January 106 B.C. His mother, Helvia, is said to have been of good family. His father was by some said to have been descended from Attius Tullius, the Volscian host of Coriolanus, while spiteful persons declared him to have been a fuller; in any case he was a Roman knight with property at Arpinum and a house in Rome. His health was weak, and he generally lived at Arpinum, where he devoted himself to literary pursuits. Cicero spent his boyhood partly in his native town and partly at Rome. The poet Archias, he says, first inspired him with the love of literature. He was much impressed by the teaching of Phaedrus, the Epicurean, at a period before he assumed the toga virilis; he studied dialectic under Diodotus the Stoic, and in 88 B.C. attended the lectures of Philo, the head of the Academic school, whose devoted pupil he became. He studied rhetoric under Molo (Molotus of Rhodes), and law under the guidance of Q. Mucius Scaevola, the augur and jurist consultant. After the death of the augur, he transferred himself to the care of Q. Mucius Scaevola, the pontifex maximus, a still more famous jurist consultant, nephew of the augur. His literary education at this period consisted largely of verse-writing and making translations from Greek authors. We hear of an early poem named Pontius Glaucus the subject of which is uncertain, and of translations of Xenophon's Oeconomica and the Phenomena of Aratus. Considerable fragments of the latter work are still extant. To this period also belongs his de Inventione rhetorica, of which he afterwards spoke lightly (de Orat. i. 5), but which enjoyed a great vogue in the middle ages. Cicero also, according to Roman practice, received military training. At the age of seventeen he served in the social war successively under Pompeius Strabo and Sulla (89 B.C.). In the war between Marius and Sulla has sympathies with Sulla, but he did not take up arms (Sext. Rosc. 136, 142).

His forensic life begins in 81 B.C., at the age of twenty-five. A speech delivered in this year, pro Quinctio, is still extant; it is concerned with a technical point of law and has little literary merit. In the following year he made his celebrated defence of Sextus Roscius on a charge of parricide. He subsequently defended a woman of Arretium, whose freedom was impugned on the ground that Sulla had confiscated the territory of that town. Cicero then left Rome on account of his health, and travelled for two years in the East. He studied philosophy at Athens under various teachers, notably Antiochus of Ascalon, founder of the Old Academy, a combination of Stoicism, Platonism and Peripateticism. In Asia he attended the courses of Xenocrates, Diogenes and Menippus, and in Rhodes those of Posidonius, the famous Stoic. In Rhodes also he heard rhetoric once more under Molo, to whom he ascribes a decisive influence upon the development of his literary style. He had previously affected the florid, or Asiatic, style of oratory then current in Rome. The chief faults of this were excess of ornament, antithesis, alliteration and assonance, monotonity of rhythm, and the insertion of words purely for rhetorical effect, Molo, he says, rebuked his youthful extravagance and he came back "a changed man."

He returned to Rome in 77 B.C., and appears to have married at this time Terentia, a rich woman with a domineering temper, to whom many of his subsequent embarrassments were due.3 He engaged at once in forensic and political life. He was quaestor in 75, and was sent to Lilybaeum to superintend the corn supply. His connexion with Sicily led him to come forward in 70 B.C., when consul, as a candidate for the post of quaestor, to prosecute Gaius Verres, who had stripped the island for three years. Cicero seemed predestined for the post, but it was the custom at Rome for a rising politician to

1 Brutos, § 56 "From Molon did operam...ut nimis redundanti nos et supra fluentius iuventudem diuidam incidere et licentia reprimere et quasi extra ripas deflectisse coercret."
2 According to Plutarch she urged her husband to take up arms against Catiline, who had compromised her half-sister Fabia, also to give evidence against Clodius, being jealous of his sister Clodia.
in his spurs by attacking a notable offender (pro Caelio, 73). In the following year he defended Marcus (or Manius) Fonteius on a charge of extortion in Gaul, using various arguments which might equally well have been advanced on behalf of Verres himself.

In 68 B.C. his letters begin, from which (and especially those to T. Pomponius Atticus, his "second self") we obtain wholly unique knowledge of Roman life and history. In 66 B.C. he was praetor, and was called upon to hear cases of extortion. In the same year he spoke on behalf of the proposal of Gaius Manilius to transfer the command against Mithradates from Lucullus to Pompey (de Lege Manilia), and delivered his clever but disingenous defence of Aulus Cluentius (pro Cluentio). At this time he was a prospective candidate for the consulship, and was obliged by the hostility of the nobles towards "new men" to look for help wherever it was to be found. In 65 B.C. he even thought of defending Catiline on a charge of extortion, and delivered two brilliant speeches on behalf of Gaius Cornelius, tribune in 67 B.C., a leader of the democratic party. In 64 B.C. he lost his father and his son Marcus was born. The optimates finally decided to support him for the consulship in order to keep out Catiline, and he eagerly embraced the "good cause," his affection for which from this time onward never varied, though his actions were not always consistent.

The public career of Cicero henceforth is largely covered by the general article on Rome: History, II. "The Republic," ad fin. The year of his consulship (63) was one of amazing activity, both administrative and oratorical. Besides the three speeches against Publius Rullus and the four against Catiline, he delivered a number of orations, among which that on behalf of Gaius Rabirius is especially notable. The charge was that Rabirius (q.e.) had killed Saturninus in 100 B.C. and by bringing it the democrats challenged the right of the senate to declare a man a public enemy. Cicero, therefore, was fully aware of the danger which would threaten himself from his execution of the Catilinarian conspirators. He trusted, however, to receive the support of the nobles. In this he was disappointed. They never forgot that he was a "new man," and were jealous of the great house upon the Palatine which he acquired at this time. Caesar had made every possible effort to conciliate Cicero, but, when all overtures failed, allowed Publius Clodius to attack him. Cicero found himself deserted, and on the advice of Cato went into exile to avoid bloodshed. He left Rome at the end of March 58, and arrived on the 23rd of May at Thessalonica, where he remained in the deepest depression until the end of November, when he went to Dyrrhachium (Durazzo) awaiting his recall. He left for Italy on the 4th of August 57, and on arriving at Brundisium (Brindisi) found that he had been recalled by a law passed by the comitia on the very day of his departure. On his arrival at Rome he was received with enthusiasm by all classes, but did not find the nobles at all eager to give him compensation for the loss of his house and villas, which had been destroyed by Clodius. He was soon encouraged by the growing coolness between Pompey's attack on Caesar during his consulship, and after his successful defence of Publius Sestius on the 10th of March he proposed on the 5th of April that the senate should on the 15th of May discuss Caesar's distribution of the Campanian land. This brought about the conference of Luca (Lucua). Cicero was again deserted by his supporters and threatened with fresh exile. He was forced to publish a "re- cantation," probably the speech de Provinciis Consularibus, and in a private letter says frankly, "I know that I have been a regular ass." His conduct for the next three years teems with inconsistencies which we may deplore but cannot pass over. He was obliged to defend in 54 Publius Vatinus, whom he had fiercely attacked during the trial of Sestius; also Aulus Gabinius, one of the consuls to whom his exile was due; and Rabirius Postumus, an agent of Gabinius. On the other hand, he made a violent speech in the senate in 55 against Lucius Piso, the colleague of Gabinius in 58. We know from his letters that he accepted financial aid from Caesar, but that he repaid the loan before the outbreak of the civil war. There is no doubt that he was easily deceived. He was always an optimist, and thought that he was bringing good influence to bear upon Caesar as afterwards upon Octavian. His actions, however, when Caesar's projects became manifest, sufficiently vindicated his honesty. During these unhappy years he took refuge in literature. The de Oratore was written in 55 B.C., the de Republica in 54, and the de Legibus at any rate begun in 52. The latter year is famous for the murder of Clodius by T. Annius Milo on the Appian Way (on the 18th of January), which brought about the appointment of Pompey as sole consul and the passing of the special laws dealing with rioting and bribery. Cicero took an active part in the trials which followed, both as a defender of Milo and his adherents and as a prosecutor of the opposite faction. At the close of the year, greatly to his annoyance, he was sent to govern Cilicia under the provisions of Pompey's law (see Pompey and Rome: History). His reluctance to leave Rome, already shown by his refusal to take a province, after his prætorship and consulship, was increased by the publication of his work on Tullia, then a widow, to marry again. During his absence she married the profligate spendthrift, P. Cornelius Dolabella.

The province of Cilicia was a large one. It included, in addition to Cilicia proper, Isauria, Lycaonia, Pisidia, Pamphylia and Cyprus, as well as a protectorate over the client kingdoms of Cappadocia and Galatia. There was also danger of a Parthian inroad. Cicero's legate was his brother Quintius Cicero (below), an experienced soldier who had gained great distinction under Caesar in Gaul. The fears of Parthian invasion were not realized, but Cicero, after suppressing a revolt in Cappadocia, undertook military operations against the hill-tribes of the Amanus and captured the town of Findenissus after a siege of forty-six days. A supplicatio in his honour was voted by the senate. The early months of 50 were occupied by the administration of justice, chiefly at Laodicea, and by various attempts to alleviate the distress in the province caused by the exactions of his predecessor, M. Claudius. He had to withstand pressure from influential persons (e.g., M. Brutus, who had business interests in his province), and refused to provide his friends with wild beasts for their games in Rome. Leaving his province on the earliest opportunity, he reached Brundium on the 24th of November, and found civil war inevitable. He went to Rome on the 4th of January, but did not enter the city, since he aspired to a triumph for his successes. After the outbreak of war he was placed by Pompey in charge of the Campanian coast. After much irresolution he refused Caesar's invitations and resolved to join Pompey's forces in Greece. He was shocked by the feroceous language of his party, and himself gave offence by his bitter jests (Plut. Cic. 38). Through illness he was not present at the battle of Pharsalus, but afterwards was ordered the command by Catru the Younger at Corcyra, and was threatened with death by the young Cn. Pompeius when he refused to accept it. Thinking it useless to continue the struggle, he sailed to Brundium, where he remained until the end of the year. On receiving a kind letter from Caesar, he went to Rome. Under Caesar's dictatorship Cicero abstained from politics. His voice was raised on three occasions only: once in the senate in 46 to praise Caesar's clemency to M. Claudius Marcellus (pro Marcellio), to plead in the same year before Caesar for Quintus Ligarius, and in 45 on behalf of Deiotarus, tetrarch of Galatia, also before Caesar. His young and wealthy family troubled at this period. In 46, his patience giving way, he divorced Terentia, and married in his young and wealthy ward Publia. Then came the greatest grief

1 Caesar, at one time, offered him a place on the coalition, which on his refusal became a triumvirate (Alt., 11, 3; 3: Prov. Cons., 41), and afterwards a post on his commission for the division of the Campanian land, or a legatio libera.

2 Alt. vii. 5, 6: "est enim demum ab austri et ignebuis hucusque firme et turpiter esse." She was married in 63 B.C. to C. Calpurnius Piso Frugi, whom Cicero found a model son-in-law. He appears to have died before 56, since in that year Tullia was betrothed to Furius Crassipes (see Plut. Cato, 41). It is not known if this marriage actually took place.

3 That the loss of his triumph rankled in his mind may be seen from Brutus, 5, 255: "hanc gloriarm... tuae quidem supplicationionem non, sed triumphus multorum antepeto."
of his life, the death of Tullia, his beloved daughter. He shortly afterward divorced Publilia, who had been jealous of Tullia's influence, and lived with Fulvia for the rest of his days. To reconcile his troubles he devoted himself wholly to literature. To this period belong several famous rhetorical and philosophical works, the Brutus, Orator, Partitiones Oratoriae, Paradoxa, Academica, de Finibus, Tusculan Disputations, together with other works now lost, such as his Laus Catonis, Consolatio and Hortensius.

His repose was broken by Caesar's murder on the 15th of March 44, to which he was not a party. On the 17th of March he delivered a speech in the senate urging a general amnesty like that declared in Athens after the expulsion of the Thirty Tyrants. When it became apparent that the conspirators had only removed the despot and left the despotism, he again devoted himself to philosophy, and in an incredibly short space of time produced the de Natura Deorum, de Divinatione, de Fato, Cato maior (or de Senectute), Laelius (or de Amicitia), and began his treatise de Officiis. To this period also belongs his lost work de Gloria. He then projected a journey to Greece in order to see his son Marcus, then studying at Athens, of whose behaviour he heard unfavourable reports. He reached Syracuse on the 1st of August, having during the voyage written from memory a translation of Aristotle's Topica. He was driven back by unfavourable winds to Leucopatra, and then, hearing better news, returned to Rome on the 21st of August. He was bitterly attacked by Marcus Antonius (Mark Antony) in the senate on the 1st of September for not being present there, and on the next day replied in his First Philippic. He then left Rome and devoted himself to the completion of the de Officiis, and to the composition of his famous Second Philippic, which was never delivered, but was circulated, at first privately, after Antony's departure from Rome to Cisalpine Gaul on the 28th of November.

Cicero returned to Rome on the 9th of December, and from that time forward led the republican party in the senate. His policy, stated briefly, was to make use of Octavian, whose name was synonymous with loyalty, and to depose the veterans, until new legionaries had been raised which would follow the republican commanders (Phil. xi. 39). Cicero pledged his credit for the loyalty of Octavian, who styled him "father" and affected to take his advice on all occasions (Epp. ad Brut. i. 17: s). Cicero, an incorruptible optimist in politics, may have convinced himself of Octavian's sincerity. The breach, however, was bound to come, and the saying, maliciously attributed to Cicero, that Octavian was an "excellent youth who must be praised and—sent to another place," neatly expresses the popular view of the situation.1 Cicero was sharply criticized by M. Junius Brutus for trucking to Octavian while showing irreconcilable enmity to Antony and Lepidus (ad Brut. i. 16. 4. i. 15. 9); but Brutus was safe in his province, and it is difficult to see what other course was open to a politician in Rome. Whether Cicero was right or wrong, none can question his amazing energy. He delivered his long series of Philippic at Rome, and kept up a correspondence with the provincial governors and commanders, all short-sighted and selfish, and several of them half-hearted, endeavouring to keep each man in his place and to elaborate a common plan of operations. He was naturally included in the list of the proscribed, though it is said that Octavian fought long on his behalf, and was slain near Formiae on the 7th of December 43. He had a ship near in which he had previously attempted to fly, but being cast back by unfavourable winds he returned to his villa, saying, "Let me die in the country which I have often saved." His head and hands were sent to Rome and nailed to the rostra, after Fulvia, wife of Antony and widow of Clodius, had thus restored a hairpin through the tongue.

Works.—The literary works of Cicero may be classed as (1) rhetorical; (2) oratorical; (3) philosophical and political; (4) epistolary.

5. Rhetorical.—His chief works of this kind are: (a) de Oratore, a treatise in three books dedicated to his brother Quintus. The discussion is conducted in the form of a dialogue which is supposed to have occurred in 91 B.C. chiefly between the two orators L. Crassus and M. Antonius. The first book deals with the studies necessary for an orator; the second with the treatment of the subject matter; the third with the form and delivery of a speech. Cicero says of this work in a letter (Fam. i. 9. 23) that it "does not deal in hackneyed rules and embraces the whole theory of oratory as laid down by Isocrates and Aristotle." (b) Brutus, or de claris oratoribus, a history of Roman eloquence containing much valuable information about his predecessors, drawn largely from the Chronicle (liber annals) of Atticus (§§ 14, 15). (c) Orator, dedicated to M. Brutus, sketching a portrait of the perfect and ideal orator, Cicero's last word on oratory. The sum of his conclusion is that the perfect orator must also be a perfect man. Cicero says of this work that he has "concentrated in all his taste" (Fam. vi. 18. 4). The three treatises are intended to form a continuous series containing a complete system of rhetorical training.

It will be convenient to mention here a feature of Ciceronian prose on which singular light has been thrown by recent inquiry. In the de Oratore, iii. 173 seqq., he considers the element of rhythm or metre in prose, and in the Orator (174-226) he returns to the subject. He distinguishes between three different rhythms: (1) Normal (or correct) rhythm, i.e. the rhythm should be metrical in character, though it should not be entirely metrical, since this would be poetry (Orator, 220). Greek writers relied for metrical effect in prose on those feet which were not much used by them. (2) Aristeron rhythm, Cicero preferred the cretic Û, which he says is the metrical equivalent of the paeon. Demonsthenes was especially fond of the cretic. Rhythm pervades the whole sentence but is most important at the end. Thus Cicero objects to "the way in which the Romans were incredibly sensitive to such points. We are told that an assembly was stirred to wild applause by a double trochee Û. If the order were changed, Cicero says, the effect would be lost. The same is said of the membra which compose the sentence. He quotes a passage from one of his own speeches in which any change in the order would destroy the rhythm. Cicero gives various clausulae which his ears told him to be good or bad, but his remarks are desultory. He also refers to the ears of Quintilian, whose examples were largely drawn from Cicero's writings. It was left for modern research to discover rules of harmony which the Romans obeyed unconsciously. Other investigators had shown that Cicero's clausulae are generally variations of some three or four forms in which the rhythm is trochaic. Dr. Thaddeus Zieinski of St. Petersburg, after examining all the clausulae in Cicero's speeches, finds that they are governed by a law. In every clausula there is a basis followed by a cadence. The basis consists of a group of words or a metre which is repeated or foreshadowed in the verse or prose which follows, and is often split into two short sections, e.g. esset vidiatis. These two classes, V and L, include 86% of the clausulae in the orations. Some rare clausulae which he terms M (=malae) introduce no new principle. There remain two interesting forms, viz. S (=selectae), in which a spondeon is substituted for a trochee in the cadence, e.g. Û, this being done for special emphasis, and P (=passimae), where a dactyl is so used, e.g. Û. This rule applies to the membra of the sentence. Whether in these though the S and P forms are more frequent, harmony being restored in the clausula.

These results apply not only to the speeches but also to the (iii. 1. 21). This is a manual of rhetoric derived from Greek sources which contains directions from several masters. Cicero's juvenile work de Inventione appears to be drawn partly from this and partly from a treatise by Hermagoras. This is a slight production and does not require detailed notice. Other minor works which stand out in Cicero's life, such as the Partitiones Oratoriae, also need only be mentioned. The system of rhetoric, in which instruction is given by Cicero to his son Marcus; the Topica, and an introduction to a translation of the speeches delivered by Demosthenes and Aeschines for and against Ctesphon, stand first amongst minor orati of which 

1 "Fam. xi. 20 "laudandum adolescentem, ornandum, tollendum."

With these it is usual to include a treatise to Herennius by an anonymous author, a contemporary of Sulla, in modern times generally identified with a person named Cornificius, quoted by Quintilian

2 "Oct. § 214 "patris dictum sapisen temeritas fili commoravi.—hoc diehorei tantus clamor conftiones excusatiss est ut admirable esse. Quero, nonne id numerus efficet? Verborum ordinem immuta, fac sic: "Comoravi fili temeritas" jam nihil erit."

3 This theory is partly derived from Tullius Maurus (c. d. 290), who says of the cistic (v. 1440 sqq.—) that Plinius orantes decebunt quando paene in ultimo Quinsetam sedem beatam, terminet si clausam

Dactylus spondeus inam, nec trocaenius respue:
Plienius tractatur istud arte prosa rhotatrum."
philosophical writings and the more elaborate letters, and with modifications to other rhetorical prose, e.g. that of Pliny and Seneca. Rhythm was avoided by Caesar who was an Atticist, and by Sallust who was an archaist. Livy’s practice is exactly opposite to that of Cicero, since he has a marked preference for the S forms, thereby exemplifying Cicero’s saying that long syllables are more appropriate to history than to oratory.1

(ii.) Speeches.—These were generally delivered before the senate or people, if political in character, and before jurors sitting in a quaestio, if judicial. The speech against Vatinius was an attack upon a witness under examination; that de Domō was made before the Pontifices; that pro C. Rabirio perdulsiounes rei in the course of a provocatio to the people; and those pro Ligario and pro rege Deiotaro before Caesar. The five orations composing the Actio Secunda in Verrem were never spoken, but written after Verres had gone into exile. The Second Philippic also was not delivered but issued as a pamphlet. Cicero’s speech for Milo at his trial was not a success, though, as Quintillian (ix. 2. 54) quotes from it, as taken down by shorthand reporters, an example of a rhetorical figure well used, it cannot have been such a failure as is alleged by later writers. The extant speech was written by Cicero at his leisure. None of the other speeches are in the exact form in which they were delivered. Cicero’s method was to construct a commentarius or skeleton of his speech, which he used when speaking. If he was pleased with a speech he then wrote it out for publication. Sometimes he omitted in the written speech a subject on which he had spoken. A record of this is sometimes preserved: e.g. “de Postumio criminibus” (Mur. 51), “de teste Fuio” (Cael. 19). These commentarii were published by his freedman Tiro and are quoted by Asconius (ad Orat. in Toga Candida, p. 87).

Cicero in his speeches must be given all the privileges of an advocate. Sometimes he had a bad client; he naively confesses the straits to which he was put when defending Scamander (Clu. 51; cf. Phil. xiii. 26). He thought of defending Catiline, though he says that his guilt is clear as noon-day (Att. i. 1-2 and 9). Sometimes the brief which he held at the moment compelled him to take a view of facts contrary to that which he had previously advocated. Thus in the pro Caeccina he alleges judicial corruption against a witness, Fucala, while in the pro Cluentio he contends that the offence was not proved (Caec. 28, Clu. 103). He says quite openly that “it is a great mistake to suppose that statements in his speeches express his real opinions” (Clu. 139). It is therefore idle to reproach him with inconsistencies, though these are sometimes very singular. Thus in the pro Cornelio he speaks with praise of Aulus Gabinius, who, when a colleague vetoed his proposal, proceeded to depose him after the precedent set by Tiberius Gracchus (Asconius in Cornel. p. 71). In the pro Cluentio, 111, he contends that nothing is easier than for a new man to rise at Rome. In the pro Caelio he says that Catiline had in him undeveloped germ of the same virtues, and that it was the good in him that made him so dangerous (Caec. 12-14). He sometimes deliberately puts the case upon a wrong issue. In the pro Milone he says that either Milo must have lain in wait for Clodius or Clodius for Milo, leaving out of sight the truth, that the encounter was due to chance. He used to boast that he had cast dust into the eyes of the jury in the case of Cluentius (Quintil. ii. 17-21).

Cicero had a perfect mastery of all weapons wielded by a pleader in Rome. He was specially famous for his pathos, and for this reason, when several counsel were employed, always spoke last (Orat. 130). A splendid specimen of pathos is to be found in his account of the condemnation and execution of the Sicilian captives (Verr. (Act. ii.) v. 106-122). Much exaggeration was permitted to a Roman orator. Thus Cicero frequently speaks as if his client were to be put to death, though a criminal could always evade capital consequences by going into exile. His enemies scoffed at his “tear-drops.” He indulged in the morbid, the tragic, which he transmits to the modern reader, e.g. in his speeches against Vatinius and Piso, not offensive to Roman taste (de Orat. ii. 216-290). He was much criticized for his jokes, and even Quintillian (ii. 17-21) regrets that he made so many in his speeches. He could never resist the temptation to make a pun. It must be remembered, however, that he was the great wit of the period. Caesar used to have a collection of Cicero’s bon-mots brought to him. Cicero complains that all the jokes of the day were attributed to himself, including those made by very sorry jesters (Fam. vii. 32; 1). A fine specimen of sustained humour is to be found in his speech pro Murena, where he ridicules the juriscounsults and the Stoics. He was also criticized for his vanity and perpetual references to his own achievements. His vanity, however, as has been admirably remarked, is essentially that of “the poet, not of the gander,” and is redeemed by his willingness to raise a laugh at his own expense (Strachan-Davidson, p. 132). Some critics have impugned his legal knowledge, but probably without justice. It is true that he does not claim to be a great expert, though a pupil of the Sceavolas, and when in doubt would consult a juriscounsel; also, that he frequently passes lightly over important points of law, but this was probably because he was conscious of a flaw in his case.

(iii.) Political and Philosophical Treatises.—These are generally written in the form of dialogues, in which the speakers sometimes belong to bygone times and sometimes to the present. The first method was known as that of Heracleides, the second as that of Aristotle (Att. xiii. 19. 4). There is no reason to suppose that the speakers held the views with which Cicero credits them, or had such literary powers as would make them able to express such views (ib. xiii. 12. 3). The political works are de Republica and de Legibus. The first was a dialogue in six books concerning the best form of constitution, in which the speakers are Scipio Africanus Minor and members of his circle. He tells us that he drew largely from Plato, Aristotle, Theophrastus and writings of the Peripatetics. The famous “Dream of Scipio” recalls the “Vision of Er” in Plato’s Republic (Book x. ad fin.). The de Legibus, a sequel to this work in imitation of Plato’s Laws, is largely plagiarized.

Cicero as a philosopher belonged to the New Academy. The followers of this school were free to hear all arguments for and against, and to accept the conclusion which for the moment appeared most probable (Acad. ii. 131). Thus in the Tusculan Disputations v. he expresses views which conflict with de Finibus iv., and defends himself on the ground that as an Academic he is free to change his mind. He was much fascinated by the Stoic morality, and it has been noticed that the Tusculan Disputations and de Officiis are largely Stoic in tone. He has nothing but contempt for the Epicureans, and cannot forgive their neglect of literary style. As Cicero’s philosophical writings have been severely attacked for want of originality, it is only fair to recollect that he resorted to philosophy as an anodyne when suffering from mental anguish, and that he wrote incredibly fast. He issued two editions of his Academics. The first consisted of two books, in which Catulus and Lucullus were the chief speakers. He then rewrote his treatise in four books, making himself, Varro and Atticus the speakers. The Romans at this time had no manuals of philosophy or any philosophical writings in Latin apart from the poem of Lucretius and some unskilful productions by obscure Epicureans. Cicero set himself to supply this want. His works are confessedly in the main translations and compilations (Att. xii. 52; 3); all that he does is to turn the discussion into the form of a dialogue, to adapt it to Roman readers by illustrations from Roman history, and to invent equivalents for Greek technical terms. This is equally true of the political treatises. Thus, when Atticus criticized a strange statement in de Republic. ii. 8, that all the cities of the Peloponnesse had access to the sea, he excuses himself by saying that he found it in Dicearchus and copied it word for word (Att. vi. 2. 3). In the same passage he used an incorrect adjective, Philutius for Philutis; he says that he had already corrected his own copy, but the mistake survives in the single palimpsest in which this work has been preserved. The only merits, therefore, which can be claimed for Cicero are that he invented a philosophical terminology for the Romans, and that he produced a
series of manuals which from their beauty of style have had enduring influence upon mankind.

The most famous of these treatises are the following:—

De Finibus, on the Supreme Good. In Book i. L. Manlius Torquatus explains the Epicurean doctrine, which is refuted in ii. by Cicero. In iii. and iv. Marcus Tullius Cicero sets forth the doctrine of the Stoics, and Cicero agrees with that of Antiochus of Ascalon; in v. M. Pupius Piso explains the views of the Academicians and Peripatetics.

Tusculanae Disputationes, so called from Cicero's villa at Tusculum in which the discussion is supposed to have taken place. The subjects treated are:—in Book i., the nature of death and the reasons for despising it; Book ii., the endurance of pain: Pain is not an evil; Book iii., wisdom makes a man insensible to sorrow; Book iv., what makes a man wise and courageous; Book v., virtue or the love of justice is the path to self-security. The materials are drawn largely from works of Dicaearchus.

De Doctrum Natura.—The dialogue is placed in 77 B.C. In Book i. Vettius Bibulus draws other philosophies and explains the system of Epicurus. He is then refuted by Cotta. In Book ii. Balbus, speaking as a Stoic, discusses the existence of the gods, nature, the government of the world and providence. In Book iii. Cotta criticizes the views of Balbus. The statement of the Epicurean doctrine is drawn from the work of Phaedrus οs των, the criticism of this from Posidonius. The Stoic teaching is derived from Cleanthes, Chrysippus and Zeno, and is criticized from the writings of Carneades and Scaevola.

De Officiis, addressed to his son Marcus. In this the form of dialogue was not employed. The material is chiefly drawn from Stoic sources, e.g. works of Panaetius in Books i. and ii., of Posidonius and in Book iv.

The Academica, as they have come down to us, are a conflation from the two editions of this work. They consist of the second book from the first edition, and a portion of the first book from the second edition.

Catilina, or de Senectute, a dialogue placed in 150 B.C. In which Cato, addressing Scipio and Laelius, set forth the praises of old age. The idea is drawn from Aristo of Chios, and the materials largely drawn from Plato.

Laelius, or de Amicitia, a dialogue between Laelius and his son-in-law, in which he sets forth the theory of friendship, speaking with special reference to the recent death of Scipio. Cicero here draws from a work of Theophrastus on the same subject and from Aristotle.

(iv.) Letters—Those preserved are (1) ad Familiores, i.-xvi.; (2) ad Atticum, i.-xviii.; (3) ad Quintum, i.-iii.; (4) ad Brutum, i.-ii.

Some thirty or five other books of letters were known to antiquity, e.g. to Caesar, to Pompey, to Octavian and to his son Marcus.

The collection includes nearly one hundred letters written to other persons. Thus, the eighth Book ad Fam. consists entirely of letters from Cælius to Cicero when in Cilicia. When writing to Atticus Cicero frequently sent copies of letters which he had received. There is a great variety in the style not only of Cicero's correspondents, but also of Cicero himself. Cælius writes in a breezy, school-boy style; the Latinity of Plancus is Ciceronian in character; the letter of Sulpicius to Cicero on the death of Tullus is a masterpiece of style; Matius writes a most dignified letter justifying his affectionate regard for Caesar's memory. There is an amazingly indiscrct letter of Quintus to his brother's freedman, Tiro, in which he says of the consuls-elect, Hirtius and Pansa, that he would hesitate to put one of them in charge of a village on the frontier, and the other in that of the basement of a tavern (Fam. xvi. 27. 2). Several of his correspondents are mentioned with much sincerity, e.g. Cato, or a awkward and laconic epistle, apologizing for its length. Metellus Celer is very rude, but gives himself away in every word. Antony writes had Latin, while Cicero himself writes in various styles. We have such a cri de cœur as his few words to one of the conspirators after Caesar's murder, "I congratulate you. I rejoice for myself. I love you. I watch your interests; I wish for your love and to be informed what you are doing and what is being done" (Fam. vi. 13). When writing to Atticus he eschews all ornamentation, uses short sentences, colloquial idioms, rare diminutives and continually quotes Greek. This use of Greek tags and quotations is also found in letters to other intimate friends, e.g. Paetus and Cælius; also in letters written by other persons, e.g. Cassius to Cicero; Quintus to Tiro, and subsequently in those of Augustus to Tiberius. It is a feature of the colloquial style and often corresponds to the modern use of "slang." Other letters of Cicero, especially those written to persons with whom he was not quite at his ease or those meant for circulation, are composed in his elaborate style with long periods, parentheses and other devices for obscurity thought. These are throughout rhetorical in character, like his speeches and philosophical works.

We know from Cicero's own statement (Att. xvi. 5. 7) that he thought of publishing some of his letters during his lifetime. On another occasion he jestingly charges Tiro with wishing to have his own letters included in the "volumes" (Fam. xvi. 17. 1). It is obvious that Cicero could not have meant to publish his private letters to Atticus in which he makes confessions about himself, or those to Quintus in which he sometimes outsteps the limits of brotherly criticism, but was thinking of polished productions such as the letters to Lentulus Spinther or to T. Lucceius which he describes as "very pretty" (Att. iv. 6. 4).

It is universally agreed that the letters ad Familiores were published by Tiro, whose hand is revealed by the fact that he suppresses all letters written by himself, and modestly puts at the end those written to him. That Tiro kept copies of his letters, or of many of them, we know from a passage in which, when addressing a friend who had inadvertently torn up a letter from him, he says that there is nothing to grieve about; he has himself a copy at home and can replace the loss (Fam. vii. 25. 1). Tiro may have obtained from Terentia copies of letters written to her. It has been suggested that he may also have edited the letters to Quintus, as he could obtain them from members of the family. The letters ad Familiores were generally quoted in antiquity by books, the title being taken from the first letter, e.g. Cicero ad Varronem epistulae Pueri.

While the letters ad Familiores were circulated at once, those to Atticus appear to have been suppressed for a considerable time. Cornelius Nepos (Att. 16) knew of their existence but distinguishes them from the published letters. Asconius (p. 87), writing under Claudius, never quotes them, though, when discussing Cicero's projected defence of Catiline, he could hardly have failed to do so, if he had known them. The first author who quotes them is Seneca. It is, therefore, probable that they were not published by Atticus himself, who died 32 B.C., though his hand may have been in the suppression of all letters written by himself, but that they remained in the possession of his family and were not published until about A.D. 60. At that date they could be published without expurgation of any kind, whereas in the letters ad Familiores the editor's hand is on one occasion (iii. 10. 11) manifest. Cicero is telling Attius, his predecessor in Cilicia, of the measures which he is taking on his behalf. There then follows a lacuna. It is obvious that Tiro thought the passage compromising and struck it out. In the letters to Atticus, on the other hand, we have Cicero's private journal, his confessions to the director of his conscience, the record of his moods from day to day, without alternations of any kind.

Cicero's letters are the chief and most reliable source of information for the period. It is due to them that the Romans of the day are living figures to us, and that Cicero, in spite of, or rather in virtue of his frailties, is intensely human and sympathetic. The letters to Atticus abound in self-revelation, though even in the presence of his confessor his instinct as a pleader makes him try to justify himself. The historical value of the letters, therefore, completely transcends that of Cicero's other works. It is true that these are full of information. Thus we learn much from the de Legibus regarding the constitutional history of Rome, and much from the Brutus concerning the earlier orators. The speeches abound in details which may be accepted as authentic, either because there is no reason for misrepresentation or on account of their circumstantiality. Thus the Vereines are our chief source of information for the government of the provinces, the system of taxation, the powers of the governor. We hear from them of such interesting details as that the senate annul a judicial decision improperly arrived at by the governor, or that the college of tribunes could consider the status at Rome of a man affected by this decision (Verr. II. ii. 95-100). We have unfolded to us the monstrous system by which the governor could fix upon a remote place
for the delivery of corn, and so compel the farmer to compound by a payment in money which the orator does not, blame, on this ground that it is only proper to allow magistrates to receive corn wherever they wish (ib. iii. 190). From the speech pro Cuestio (145-154) we gain unique information concerning the condition of society in a country town, the extraordinary exemption of equites from prosecution for judicial corruption, the administration of domestic justice in the case of slaves examined by their owner (ib. 176-187). But we have always to be on our guard against misrepresentation, exaggeration and falsehood. The value of the letters lies in the fact that in them we get behind Cicero and are face to face with the other dramatis personae; also that we are admitted behind the scenes and read the secret history of the times. One of the most interesting documents in the correspondence is a despatch of Caesar to his agent Oppius, written in great haste and in disjointed sentences. It runs as follows: 'On the 9th I came to Brundisium. Pompey is at Brundisium. He sent Magnius to me to treat of peace. I gave him a suitable answer' (Att. ix. 13, 11). In the de Beilo civili, on the other hand, Caesar, who wishes to show that he did his best to make peace, after stating that he sent his captive Magnius to negotiate, expresses mild surprise at the fact that Pompey did not send him back (Bell. Civ. i. 26). We hear of the extraordinary agreement made by two candidates for the consulship in Caesar's interest with the sitting consuls of 54 B.C., which Cicero says he hardly ventures to put on paper. Under the terms of this the consuls, who were optimates, bound themselves to betray their party by securing, apparently fraudulently, the election of the candidates while they in turn bound themselves to procure two ex-consuls who would swear that they were present in the senate when supplies were voted for the consular provinces, though no meeting of the senate had been held, and three augurs who would swear that a lex curiata had been passed, though the comitia curiata had not been convened (Att. iv. 18, 2). But perhaps the most singular scene is the council of three great ladies presided over by Servilia at Antium, which decides the movements of Brutus and Cassius in June 44 B.C., when Cassius "looking very fierce—you would say that he was breathing fire and word"—blistered concerning what he considered an insult, viz. a commission to supply corn which had been laid upon him. Servilia calmly remarks she will have the commission removed from the decree of the senate (Att. xv. 11, 2).

(v.) Miscellaneous.—It is not necessary to dwell upon the other forms of literary composition attempted by Cicero. He was a fluent versifier, and would write 500 verses in one night. Considerable fragments from a juvenile translation of Aratus have been preserved. His later poems upon his own consulship and his exile were soon forgotten except for certain lines which provoked criticism, such as the unfortunate verse:

"O fortunatam natam me consule Romani."

He wrote a memoir of his consulship in Greek and at one time thought of writing a history of Rome. Nepos thought that he would have been an ideal historian, but as Cicero ranks history with declaration and on one occasion with negotio asks Lucius Luceceius (q.v.), who was embarking on this task, to embroider the facts to his own credit, we cannot accept this criticism (Pam. vi. 2. 3).

(vl.) Authenticity.—The genuineness of certain works of Cicero has been attacked. It was for a long time usual to doubt the authenticity of the speeches post reditum and pro Marcello. Recent scholars consider them genuine. As their rhetorical structure corresponds more or less exactly with the canon of authenticity formed by :Zellnaki from the other speeches, the question may now be considered closed. Absurd suspicion has been cast upon the letters speech pro Cuestio and that of Archelaus to Philip. For instance, pro pleide quam in exstasis irt is certainly a forgery, as also a letter to Octavian. There is a "controversy" between Cicero and Sallust which is palpably a forgery, though

a quotation from it occurs in Quintilian. Suspicion has been attached to the letters to Brutus, which in the case of two letters (i. 16 and 17) is not unreasonable because they somewhat resemble the style of suasoriae, or rhetorical exercises, but the latest editors, Tyrell and Purser, regard these also as genuine.

Ciceron. (i.) Ancient.—After Cicero's death his character was attacked by various detractors, such as the author of the spurious Contraversia put into the mouth of Sallust, and the calumniator from whom Dio Cassius (xiv. 1-28) draws the libellous statements which he compounds with those in the Calenus in the senate. This critic, Asconius (In Tac. Caid. p. 95) well says that it is best to ignore him. His prose style was attacked by Polcio as Asiatic, also by his son, Asinus Gallus, who was denied the emperor Claudius (Suet. Claudius. 64). The most unfounded, if not want of spark and epigram, and monstrosity of his clause. A certain Largius Licinius gained notoriety by attacking his Latinity in a work styled Ciceronati. His most devoted admirers were his letter to a friend, when he was about to take the Senate, and considered success, and Quintilian (x. 1. 112), who regarded him as the perfect orator, and draws most of his illustrations from his works. At a later period his style fascinated Christian writers, notably the pacificist Jerome and S. Augustine, who drew freely from his rhetorical writings.

The first commentator upon Cicero was Asconius, a Roman senator living in the reign of Claudius, who wrote a commentary upon the speeches, in which he explains obscure historical points for the instruction of his readers. He is quoted by grammatical and rhetorical writers who drew illustrations from Cicero, we may mention the Commentary of Victorinus, written in the 4th century, upon the treatise de Inventione, and that of Boethius (A.M. 476-524) upon the de Oratore. We may also mention the Scholastitio Bobetinius who is assigned to the 5th century, and a pseudo-Asconius, who wrote notes upon the Verres dealing with points of grammar and rhetoric.

The other works of Cicero are seldom mentioned. The most popular speeches were those against Catiline, the Verres, Caesarianae and Philippicas, to which may be added the spurious Contraversia. A larger knowledge of the speeches is shown by Wibald, who published his edition with apparatus criticus containing with the Philippicas the speeches against Rullus, wishing to form a corpus of Ciceronian works. Gerbert (afterwards Pope Silvester II, 949-1003) was especially interested in the speeches, and in a letter to a friend, which, 606, added himself to Cicero when journeying. The letters are rarely mentioned. The abbey of Lorech possessed in the 9th century five MSS. containing "Letters of Cicero," but those to Atticus are only mentioned once, in the catalogue of Cluny drawn up in the 12th century. Letters of Cicero were known to Wibald of Corvey, also to Servius Lupus, abbot of Ferrières (805-832), who prosecuted in the 9th century a search for MSS. which reminds us of the Italian humanists in the 15th century. But good old copies must have been attached to Cicero's works during this period. The earliest critic was Tiro, who, as we know from Aulus Gellius (i. 7, 1), corrected MSS. which were greatly valued as containing his recension. We have a very large number of philologians who have written against Rullus, in which Stilius Maximus states that he had corrected the text by the help of a MS. giving the recension of Tiro, which he had collated with five other ancient copies.

It is interesting to notice that Servius Lupus did similar work in the 9th century. Thus, writing to Ansbald of Prüm, he says, "I will collate the letters of Cicero which you sent with the copy

3 Markland and F. A. Wolf first rejected them.

4 In the speeches generally L + V = 95%. In the de Domō the proportion is 88 and in the pro Marcello 87%.
which I have so as to elicit the true reading, if possible, by comparing with the copy of the Verrines or any other works for a similar purpose. Brunetto Latini (c. ca. 1294), the master of Dante, translated the Catilinare and 1485 years to the 15th century only with the Laelius, Catilinare, and Defixionis. Petrarca says that among his countrymen Cicero was a great name, but was studied by few. Petrarca himself knew the text of the Laelius, and in 1449 wrote the speech pro Archia at Liège in 1333, and in 1434 at Verona made his famous discovery of the letters to Atticus, which revealed to the world Cicero as a man in place of the "god of eloquence" whom they thought they knew. In both in this impression in his youth that he had once possessed Cicero's lost work de Gloria, but it is probable that he was misled by one of the numerous passages in the extant writings dealing with this subject. The letters ad familiares are said by editors to be found only in 15th-century MSS. in the Paris library (lat. 6331) is, however, assigned by Chatelain to the 12th century.

For the letters ad familiares our chief source of information is Laur. xiii. 9 (9th century), which contains all the six books. The independence of these three books is so written in France and Germany in the 11th and 12th centuries, containing i.-viii. and i.-xvi. respectively. There is no extant MS. of the letters to Atticus older than the 14th century, apart from a few leaves from a 12th-century MS. discovered by Mauro Turin during the last century. Very great importance has been attached to a Florentine MS. (Laur. xiii. 18) M., which until recently was supposed to have been copied by Petrarca himself from the lost Veronensis. It is now known not to be in the hand of Cicero. It is still supposed to be the original of the MSS., and possibly of all MSS., including the lost C and Z. It has, however, been shown by Lehmann that there is an independent group of Italian MSS., termed by him Z, containing Books i.-vii. of the text and probably connected with the MS. of Vespasiana. These often agree with C against M., and the readings of MSS. C22 are generally superior.

BIBLIOGRAPHY.—It is impossible to mention more than a few works dealing with Cicero's manuscripts. Particularly for Schranz-Davison, Life of Cicero (Heroes of the Nation); C. G. Herberg, Cicero et ses amis; Strachan-Davison, Life of Cicero (Heroes of the Nation); W. Warde Fowler, Social Life at Rome (1908); introductions to the edition of Cicero's works (ed. by Chatelain); the two most recent editions of Cicero's works, those of Lehmann, De Cicero ad Atticum epistulae recensitatis (Berlin, 1892); Anecdota Oxoniensia, classical series, parts vii., ix. (London, 1892); J. Schanz, Geschichte der römischen Literatur (Munich, 1860); J. A. Trench, Church and State in the 12th and 13th centuries, an essay on Oristorical and Philosophical Works; Le Breton, Études sur le langage et la grammaire de Cicéron (Paris, 1901); Norden, Die antike Konsularwürde (Leipzig, 1886); Th. Zielinski, Das Causaelesgesetz in der römischen Rechtspolitik (Berlin, 1880); J. M. Edkins, The Monastic Office of地中海 and language (Leipzig, 1886); J. Greenidge, The Legal Procedure of Cato the Younger (Oxford, 1895). The best account of Cicero as a philosopher is given in the preface to Reid's edition of the Academica. (7) Editions (critical) of the complete texts.—Baillie-Halm (1845-1881); C. F. W. Müller (1880-1896); Oxford Classical Texts. (A. C. C.)

2. QUINTUS TULLIUS CICERO, brother of the orator and brother-in-law of T. Pomponius Atticus, was born about 102 B.C. He was aedile in 67, praetor in 62, and for the three following years propraetor in Asia, where, though he seems to have obtained a personal aggrandizement, his probity and ill-temper gained him no friends. After the battle of Philippi, which he heartily supported, he tried to secure his brother's recall from exile, and was nearly murdered by his friends in the pay of P. Clodius Pulcher. He distinguished himself as one of Julius Caesar's legates in the Gallic campaigns, served in Britain, and afterwards under his brother in Cilicia. On the outbreak of the civil war between Pompey and Caesar, Quintus, like Marcus, supported Pompey, but after Pharsalus he deserted and made peace with Caesar, largely owing to the intercession of Marcus. Both the brothers fell victims to the proscription which followed Caesar's death, Quintus being put to death in 43, some time before Marcus. His marriage with Pomponia was extremely unhappy, and he was much under the influence of his slave Statius. Though trained on the same lines as Marcus he never spoke in public, and even said, "One orator in a family is enough, nay even in a city." Though essentially a soldier, he took considerable interest in literature, wrote epic poems, tragedies and annals, and translated plays of Sophocles. There are extant

No. 496 in the old catalogue, and now lost. The most faithful transcript was made in France (Paris, Lat. 14,749) before the MS. passed into Poggio's hand by a writer who carefully reproduced the corrections, sometimes in facsimile. The speeches pro Roscio, pro Sestio, pro Lito, and pro Sestio Postumo are only known from Italian copies of the transcript by Poggio from lost MSS. The de Officiis, Tusculan Disputationes and Catilinare are found in a number of 9th-century MSS. A collection, published by F. de S. P. and V. de Lactis, was discovered in several MSS. of the same date. Only one MS. of the Laelius is as old as the 10th century.

The editions of Cicero are said to be found only in 15th century MSS. in the Paris library (lat. 6331) is, however, assigned by Chatelain to the 12th century.
four letters written by him (one to his brother Marcus, and three
to his freedman Tiro) and a short paper, De Petitione Consulatus
(on canvassing for the consulship), addressed to his brother in 64.
Some consider this the work of a rhetorician of later date. A
few hexameters by him on the twelve signs of the Zodiac are
quoted by Ausonius.

Cicero in several of his Letters (ed. Tyrrell and Purser); pro Sestio,
31; Caesar, Bell. Gall.; Apian, Bell. Civ., iv. 20; Dio Cassius, xl. 7,
Adversus Petronium (1872), see also R. V. Tyrrell in Hermathena, v.
(1877), and A. Beltrami, De Commentario Petitionis Q. Cicrioni
vindicando (1892); G. Boissier, Cicero and His Friends (Eng. trans.,
1897), especially pp. 235-241.

3. Marcus Tullius Cicero, only son of the orator and his
wife Terentia, was born in 65 B.C. At the age of seventeen
he served with Pompey in Greece, and commanded a squadron
of cavalry at the battle of Pharsalus. In 45 he was sent to Athens
to study rhetoric and philosophy, but abandoned himself to a
life of dissipation. It was during his stay at Athens that his
father dedicated the de Officiis to him. After the murder of
Caesar (44) he attracted the notice of Brutus, by whom he was
offered the post of military tribune, in which capacity he rendered
good service to the republican cause. After the battle of Philippi
(42), he took refuge with Sextus Pompeius in Sicily, where the
remnants of the republican forces were collected. He took
advantage of the amnesty granted by the treaty of Misenum (39)
to return to Rome, where he took no part in public affairs,
but resumed his former dissipated habits. In spite of this, he
received signal marks of distinction from Octavian, who not only
nominated him augur, but accepted him as his colleague in the
consulship (39). He had the satisfaction of carrying out the
decree which ordered that all the statues of Antony should be
demolished, and thus "the divine justice reserved the completion
of Antony's punishment for the house of Cicero" (Plutarch).
He was subsequently appointed of Asia or Syria, but nothing
further is known of his life. In spite of his de-
bauchery, there is no doubt that he was a man of considerable
education and no mean soldier, while Brutus, in a letter to his
father (Ep. ad Brutum, ii. 3), even goes so far as to say that the
son would be capable of attaining the highest honours without
borrowing from the father's reputation.

See Plutarch, Cicero, Brutus; Appian, Bell. Civ., ii. 20, 31, iv. 20;

and Purser); G. Boissier, Cicero and His Friends (Eng. trans.,
1897), pp. 104-107.

4. Quintus Tullius Cicero (c. 67-43 B.C.), son of Quinctus
Tullius Cicero (brother of the orator). He accompanied his
uncle in Africa, and, in the hope of obtaining a
paid his kindness by informing Caesar of his intention of
leaving Italy. After the battle of Pharsalus he joined his father
in abusing his uncle as responsible for the condition of affairs,
hoping thereby to obtain pardon from Caesar. After the death of
Caesar he attached himself to Mark Antony, but, owing
to some fancied slight, he deserted to Brutus and Cassius. He
was included in the proscription lists, and was put to death with
his father in 43. In his last moments he refused under torture to
disclose his father's hiding-place. His father, who in his
conceal-
ment was a witness of what was taking place, thereupon gave
himself up, stipulating that he and his son should be executed
at the same time.

See Cicero, ad Att. x. 4. 6. 7. 3; xiv. 20. 5; Dio Cassius xlvii. 10.

Cicerone, a guide, one who conducts visitors to museums,
galleries, &c., and explains matters of archaeological, antiquarian,
historic or artistic interest. The word is presumably taken from
Marcus Tullius Cicero, as a type of learning and eloquence.
The New English Dictionary finds examples of the use earlier in
English than in Latin, (the earliest quotation being from Addison's
Dictionary of Antiquities (published posthumously in 1775). It appears
that the word was first applied to "learned antiquarians who
show and explain to foreigners the antiquities and curiosities of the
country" (quotation of 1762 in the New English Dictionary).

Cichlid (Cichlidae), a family of Acanthopterygian fishes,
related to the perches and wrasses, and confined to the fresh
and brackish waters of Central and South America, Africa,
Syria, and India and Ceylon. It has recently assumed special
importance through the large number of genera and species,
many of them showing extraordinary modifications of the
dentition, which have been discovered in tropical Africa,
especially in the great lakes Victoria, Tanganyika and Nyasa. About
180 species are known from Africa (with Syria and Madagascar),
150 from America, and 3 from India and Ceylon. They were
formerly known under the inappropriate name of Chromides.

These fish are further remarkable for their nursing habits.
It was formerly believed that the male takes charge of the
eggs and later the young, by sheltering them in the mouth and
pharynx. This may still be true of some of the American species,
but a long series of recent observations have shown that this
most efficacious parental care devolves invariably on the female
in the African and Syrian species. We are now acquainted
with a large number of species in which this extraordinary habit
has been observed, the number having lately been greatly increased
by the collections made in Lakes Tanganyika and Victoria.

L. Lorot has described a fish from Lake Tiberias in which he
believed he had observed the male take up the eggs after their
deposition and retain them in his mouth and pharynx long after
eclosion, in fact until the young are able to shift for themselves,
and this fish he named Chromis paterfamilias. A. Günther
has also ascribed the same sex to a fish from Natal, Chromis philander,
observed by N. Abraham to have similar habits. G. A. Boulenger
has since had an opportunity to examine the latter specimen
and found it to be a female, as in all other nursing individuals
from various parts of Africa, previously observed by himself;
whilst J. Pellegrin has ascertained the female sex of a specimen
with eggs in the mouth presented to the Paris museum by Lorot
as his Chromis paterfamilias (= Tilapia similis). Further
observations by Pellegrin on Tilapia galilaeana and Pelmatichromis
frontalis, by E. Schaeffer on Paratilapia multicolor, have led to
the same result.

It therefore remains unproven whether in any of the African
Cichlidae the buccal "incubation," as it has been called by
Pellegrin, devolves on the male; the instances previously
adduced being unsupported by the only trustworthy evidence—an
examination of the genital glands.

The relative size and number of the eggs thus taken charge
of vary very much according to the species. Thus they may
be moderately large and numerous (100 to 200) in Tilapia
nilotica and galilaeana, larger and only about 30 in number
in Paratilapia multicolor, while in Trophus moroii, a fish measur-
ing only 110 mm., the eggs filling the mouth and pharynx
measure 4 mm. in diameter and are only four in number, they
being proportionally the largest Teleostome eggs known.
In Paratilapia pfefferi, a fish measuring 15 mm., the eggs found
in the pharynx were only about a dozen in number, and they
measured 4½ mm. in diameter. In Tilapia dardenni, which grows
to a length of 240 mm., a score of eggs fills the mouth and
pharynx, and each measures 5 to 6 mm. in diameter, an enormous
size for so small a fish.

Pellegrin has made the interesting observation on Tilapia
galilaeana that while the eggs are developing in the bucco-pharyngeal
cavity the ovarian eggs are rapidly growing towards maturity,
so that a fresh deposition of ovum may almost immediately follow
the release of the young fishes from maternal care. (G. A. B.)

Cicisbeo (Ital.; of uncertain origin; perhaps an inversion
of bel cese, "beautiful chick (pea)," or from Fr. chicbe beau,
with same meaning), the term in Italy from the 17th century
wards for a dangler about women. The cicisbeo was the
professed galant of a married woman, who attended her at all
public entertainments, it being considered unfashionable for the
hostess to be unescorted.

Cicognara, Leopoldo, Count (1767-1834), Italian arche-
ologist and writer on art, was born at Ferrara on the 17th of
November 1767. Mathematical and physical science diverted
him a while; but his bent was decided, and not even the notice
of such men as Spallanzani and Scarpa could make a savant of
him. A residence of some years at Rome, devoted to painting
and the study of the antiquities and galleries of the Eternal City, was followed by a visit to Naples and Sicily, and by the publication, at Palermo, of his first work, a poem of no merit. The island explored, he betook himself to Florence, Milan, Bologna and Venice, acquiring a complete archaeological knowledge of these and other cities. In 1705 he took up his abode at Modena, and was for twelve years engaged in politics, becoming a member of the legislative body, a councillor of state, and minister pleni- potentiary of the Cisalpine Republic at Turin. Napoleon decorated him with the Iron Crown; and in 1808 he was made president of the Academy of the Fine Arts at Venice, a post in which he did good work for a number of years. In 1808 appeared his treatise Dei bello ragionamenti, dedicated in glowing terms to Napoleon. This was followed (1813-1818) by his magnum opus, the Storia della scultura dal suo risorgimento in Italia al secolo di Napoleone, in the composition of which he had been encouraged and advised by Giordano and Wilhelm Schlegel (1776-1845). The book was designed to complete the works of Winkelmann and D’Agincourt, and is illustrated with 180 plates in outline. In 1814, on the fall of Napoleon, Cicogna was patronized by Francis I. of Austria, and published (1815-1820), under the auspices of that sovereign, his Fabbriche più costituite di Venezia, two superb folios, containing some 150 plates, engraved by the Venetians under representation of their masters, at the expense of Caroline at Vienna, Cicogna added to the offering an illustrated catalogue of the objects it comprised; this book, Omaggio delle Provincie Venete alla maestà di Carolina Augusta, has since become of great value to the bibliophile. Reduced to poverty by these splendid editorial speculations, Cicogna contrived to alienate the imperial favour by his political opinions. He left Venice for Rome; his library was offered for sale; and in 1821 he published at Pisa a catalogue raisonné, rich in bibliographical lore, of this fine collection, the result of thirty years of loving labour, which in 1824 was purchased en bloc by Pope Leo XII., and added to the Vatican library. The other works of Cicogna are—the Memorie storiche dei letterati ed artisti Ferraresi (1811); the Vite dei più insigni pittori e scultori Ferraresi, MS.; the Memorie spettanti alla storia della caligrafia (1831); and a large number of dissertations on painting, sculpture, engraving and other kindred subjects. (See Papoli, in No. 11 of the Exile, a print written and published by Italian refugees.) Cicogna’s work in the academy at Venice, of which he became president in 1808, had important results in many respects: in raising the standard of the instruction in the courses of study, the institution of prizes, and the foundation of a gallery for the reception of Venetian pictures. He died on the 5th of March 1834.

See Zanetti, Cenni biografici di Leopoldo Cicogna (Venice, 1834); Malman, Memorie del conte Leopoldo Cicogna (Venice, 1888).

CID, THE, the favourite hero of Spain, and the most prominent figure in her literature. The name, however, is so obscur by myth and fable as scarcely to belong to history. So extravagant are the deeds ascribed to him, and so marvellous the attributes with which he has been clothed by the fond idolatry of his countrymen, that by some he has been classed with the Amadises and the Orlandos whose exploits he eulogized. The Jesuit Masdeu stoutly denies that he had any real existence, and this heresy has not wanted followers even in Spain. The truth of the matter, however, has been expressed by Cervantes, through the mouth of the Canon in Don Quixote: “There is no doubt there was such a man as the Cid, but much doubt whether he achieved what is attributed to him.” The researches of Professor Doyz, of Leiden, have amply confirmed this opinion. There is a Cid of history and a Cid of romance, differing very materially in characters, but each filling a large space in the annals of his country, and exerting a singular influence in the development of the national genius.

The Cid of history, though falling short of the poetical ideal which the patriotism of his countrymen has so long cherished, is still the foremost man of the heroic period of Spain—the greatest warrior produced out of the long struggle between Christian and Moslem, and the perfect type of the Castilian of the 12th century. Rodrigo Díaz, called de Bivar, from the place of his birth, better known by the title given him by the Arabs as the Cid (El Scid, the lord), and El Campeador, the champion par excellence, was of a noble family, one of whose members in a former generation had been elected judge of Castile. The date of his birth cannot be fixed with any certainty, but it was probably between 1030 and 1040. As Rodrigo Díaz de Vivar he is first mentioned in a charter of Ferdinand I. of the year 1064. The legends which speak of the Cid as accompanying this monarch in his expeditions to France and Italy must be rejected as purely apocryphal. Ferdinand, a great and wise prince, under whom the tide of Moslem conquest was first effectually stemmed, on his deathbed, in 1065, divided his territories among his five children. Castile was left to his eldest son Sancho, Leon to Alphonso, Galicia to Garcia, Zamora and Toro to his twodughters Urraca and Elvira. The extinction of the western caliphate and the dispersion of the once noble heritage of the Ommayads into numerous petty independent states, had taken place some thirty years previously, so that Castilian and Moslem were once again upon equal terms, the country being almost equally divided between them. On both sides was civil war, urged as fiercely as that against the common enemy, in which the parties sought allies indiscriminately among Christians and Mahomedans.

No condition of affairs could be more favourable to the genius of the Cid. He rose to great distinction in the war between Sancho of Castile and Sancho of Navarre, in which he won the name of Campeador, by slaying the enemy’s champion in single combat. In the quarrel between Sancho and his brother Alphonso, Rodrigo Díaz espoused the cause of the former, and it was he who suggested the perfidious stratagem by which Sancho eventually obtained the victory and possession of Leon. Sancho having been slain in 1072, while in the siege of Zamora, Alphonso returned from exile and occupied the vacant throne. One of the most striking of the passages in the Cid’s legendary history is that wherein he is represented as forcing the new king to swear that he had no part in his brother’s death; but there was cause enough without this for Alphonso’s animosity against the man who had helped to despoil him of his patrimony. For a time the Cid, already renowned throughout Spain for his prowess in war, was even advanced by the king’s favour and entrusted with high commissions of state. In 1074 the Cid was wedded to Ximena, daughter of the count of Oviedo, and grand-daughter, by the mother’s side, of Alphonso V. The original deed of the marriage-contract is extant. Some time afterwards the Cid was sent on an embassy to collect tribute from Tomatid, the king of Seville, whom it was found engaged in a war with Abdallah, the king of Granada. On Alphonso’s return, there were many Castilian knights, among them Count Garcia, the Cid with the wounds of the blood, whom the Cid endeavoured vainly to persuade of the disloyalty of opposing their master’s ally. In the battle which ensued under the walls of Seville, Abdallah and his auxiliaries were routed with great slaughter, the Cid returning to Burgos with many prisoners and a rich booty. These proofs of his prowess only served to kindle against him the rancour of his enemies and the jealousy of the king. Garcia Ordoñez accused him to Alphonso of keeping back part of the tribute received from Seville, and the king took advantage of the Cid’s absence on a raid against the Moors to banish him from Castile.

Henceforth Rodrigo Díaz began to live that life of a soldier of fortune which has made him famous, sometimes fighting under the Christian banner, sometimes under Moorish, but always for his own hand. At the head of a band of 300 free lance he offered his services first to the count of Barcelona; then, failing him, to Moktadir, the Arab king of Saragossa, of the race of the Beni Houd. Under Moktadir, and his successors Moutamin and Mostain, the Cid remained for nearly eight years, fighting their battles against Mahomedan and Christian alike, not engaged upon his own, and being admitted almost to a share of their royal authority. He made more than one attempt to be reconciled with Alphonso, but, his overtures being rejected, he turned his arms against the enemies of the Beni Houd, extending their dominions at the expense of the Christian states.
CIDER

of Aragon and Barcelona, and harrying even the border lands of Castile. Among the enterprises of the Cid the most famous was the conquest against Valencia, then the richest and most flourishing city of the peninsula, and an object of cupidity to both Christian and Moslem. The Cid appeared before the place at the head of an army of 7000 men, for the greater part Mahomedans. In vain did the Valencians implore succour from the emir of Cordova, and from their co-religionists in other parts of the peninsula. In defiance of an army which marched to the relief of the beleaguered city under Yusel the Almoravide, the Cid took Valencia after a siege of nine months, on the 15th of June 1094—the richest prize which up to that time had been recovered from the Moors. The conditions of the surrender were all violated—the calif Ibn Djahhaff burnt alive, a vast number of the citizens who had escaped death by famine slaughtered, and the possessions divided among the Campeador’s companions. In other respects the Cid appears to have used his victory mildly, ruling his kingdom, which now embraced nearly the whole of Valencia and Murcia, for four years with vigour and justice. At length the Almoravides, whom he had several times beaten, again rose in great force, inflicting a crushing defeat at Cuenca upon the Cid’s army, under his favourite lieutenant, Alvar Fanez. The blow was a fatal one to the aged and war-worn Campeador, who died of anger and grief in July 1099. His widow maintained Valencia for three years longer against the Moors, but was at last compelled to evacuate the city, taking with her the body of the Cid to be buried in the monastery of San Pedro at Cardena, in the neighbourhood of Burgos. Here, in the centre of a small chapel, surrounded by his chief companions—in arms, by Alvar Fanez Minaya, Pero Bermudez, Martin Antolnez and Pelaez the Asturian, were placed the remains of the mighty warrior, the truest of Spanish heroes, the embodiment of all the national virtues and most of the national vices. The bones have since been removed to the town hall of Burgos. Philip II. tried to get him canonized, but Rome objected, and nothing resulted from the amiable policy. Whatever were his qualities as a fighter, the Cid was but indifferent material out of which to make a saint,—a man who battled against Christian and against Moslem with equal zeal, who burnt churches and mosques with equal zest, who ravaged, plundered and slew as much for a livelihood as for any patriotic or religious purpose, and was in truth almost as much of a Mussulman as a Christian in his habits and his character. His true place in history is that of the greatest of the guerrilleros—the perfect type of that sort of warrior in which, from the days of Viriathus to those of Juan Diaz, El Empecinado, the soil of Spain has been most productive.

The Cid of romance, the Cid of a thousand battles, legends and dramas, the Cid as apotheosized in literature, the Cid invoked by good Spaniards in every national crisis, whose name is a perpetual and ever-present inspiration to Spanish patriotism, is a very different character from the historical Rodrigo Diaz—the freebooter, the rebel, the conscript with the infidels and the enemies of Spain. For, if the Cid is the Perfect One, the Born in a Happy Hour, " Jovis Cid," the incendiary, the magnanimous, the al-powerful, the type of knightly virtue, the mirror of patriotic duty, the flower of all Christian grace, He is Roland and Bayard in one. In the popular literature of Spain he holds a place such as has no parallel in other countries. From an almost contemporary period he has been the subject of song; and he who was chantied by wandering minstrels in the 12th century has survived to be hymned in revolutionary odes of the 19th. In a barbarous Latin poem, written in celebration of the conquest of Almeria by Alphonso VII. in the year 1147, we have the bard testifying to the supereminenes of the Cid among his country’s heroes—

" Ipsus Rodericus Mio Cid semper vocatus, De quo cantatur quod ab hostibus haud superaturus, Qui dominat Mauros, comites domuit quoque nostros."

Within a hundred years of his death the Cid had become the centre of a whole system of myths. The Poema del Cid, written in the latter half of the 12th century, has scarcely any trace of a historical character. Already the Cid had reached his apogee, and Castilian loyalty could not consent to degrade him when banished by his sovereign—

" Dios, que bien vassallos si oviese buen señor !"

cry the weeping citizens of Burgos, as they speed the exile on his way.

The Poem of the Cid is but a fragment of 1744 lines, written in a barbarous style, in rugged assonant rhymes, and a rude Alexandrine measure, but it glows with the pure fire of poetry, and is full of a noble simplicity and a true epical grandeur, invaluable as a living picture of the age. The ballads relating to the Cid, of which nearly two hundred are extant, are greatly inferior in merit, though some of them are not unworthy to be ranked with the best in this kind. Dunan believes the greatest part of them to have been written in the 16th century. A few betray, not more by the antiquity of their language than by their natural and simple tone, traces of an earlier age and a freer national life. They all take great liberties with history, thus belying the opinion of Sanchez Panza that " the ballads are too old to tell lies." Such of them as are not genuine relics of the 16th century are either poetical versions of the leading episodes in the hero’s life as contained in the Chronicle, that Chronicle itself having been doubtless composed out of still earlier legends as sung by the wandering juglares, or pure inventions of a later time, owing their inspiration to the romances of chivalry. In these last the ballad-mongers, not to let their native hero be outdone by the Amadises, the Esplandians, and the Felixmartes, engage him in the most extravagant adventures—making war upon the king of France and upon the emperor, receiving embassies from the sultan of Persia, beheading the pope at Rome, and performing other feats not mentioned even in the Poem or the Chronicle. The last and the worst of the Cid ballads are those which betray by their frigid conceits and feeble mimicry of the antique the false taste and essentially unheroic spirit of the age of Philip II. As for the innumerable other poems, dramas and tales which have been founded on the legend of the Cid, the only things which remain to give them a title to those of Quintana and Trueba, they serve merely to prove the abiding popularity of the national hero in his native land.

The chief sources from which the story of the Cid is to be gathered are, first, the Latin chronicle discovered by Riccio in the convent of San Isidro at Leon, proved by internal evidence to have been written before 1258; the Cronica General, composed by Alphonso X. in the first half of the 13th century; the "Cid" (so called) from the above, partly from contemporary Arabic histories, and partly from tradition; the Cronica del Cid, first published in 1512, by Juan de Velorado, abbot of the monastery of San Pedro at Cardena, which is a compilation from the last, intermixed with new fictions due to the piety of the compiler; lastly, various Arabic manuscripts, some of contemporary date, which are examined and their claims weighed in the second volume of Professor Dozy’s Recherches sur l’histoire politique et litteraire de l’Espagne pendant le moyen age (Leiden, 1849). Huber, Muller, and Ferdinand Wolf are among the leading authorities in the history and literature of the Cid. M. Dumas Hinnard has published the poem, with a literal French translation and notes; and John Hookham Freke has rendered it into English with extraordinary spirit and fidelity. The largest collection of the Cid ballads is that of Durant, in the Romanzo general, in two volumes, forming part of Rivadeneyra’s Biblioteca de autores espanoles.

CIDER, or CYDER (from the Fr. cidre, derived from the Lat. sicera or cissera, Gr. xiloxa, Heb. shēbār, strong drink), an alcoholic beverage made from apples.

Cider and perry (the corresponding beverage made from pears) are liquors containing from as little as 2% of alcohol to 7 or 8%, seldom more, and rarely as much, produced by the vinous fermentation of the expressed juice of apples and pears; but cider and perry of prime quality can only be obtained from vintage fruit, that is, apples and pears grown for the purpose and unsuited for the most part for table use. A few table apples make good cider, but the best perry is only to be procured from pears too harsh and astringent for consumption in any other form. The making of perry is in England confined, in the main, to the counties of Hereford, Worcester and Gloucester. These three counties, together with Somerset and Devon, constitute, too, the principal cider-making district of the country; but the
industry, which was once more widely spread, still survives in Norfolk, and has lately been revived in Kent, though, in both these counties, much of the fruit used in cider-making is imported from the west country and some from the continent. Speaking generally, the cider of Herefordshire is distinguished for its lightness and briskness, that of Somerset for its strength, and that of Devonshire for its lusciousness.

Cider used to be made in the south of Ireland, but the industry had almost become extinct until revived by the Department of Agriculture, which in 1904 erected a cider-making plant at Drogheda, Co. Louth, gave assistance to private firms at Dungarvan, Co. Waterford, and Fermoy, Co. Cork, and provided a travelling mill and press to work in the South Riding of Co. Tipperary. The results have been highly satisfactory, a large quantity of good cider having been produced.

Inasmuch as English orchards are crowded with innumerable varieties of cider apples, many of them worthless, a committee composed of members of the Herefordshire Fruit-Growers' Association and of the Fruit and Chrysanthemum Society was appointed in 1899 to make a selection of vintage apples and pears best suited to Herefordshire and the districts adjoining. The following is the list drawn up by the committee:—

Alfred Golden, Beale's Golden, Cumber Red, Dymock Red, Eggleton Styre, Kingston Black or Black Taunton, Skyrne's Kernel, Spreading Redstreak, Carrion apple, Cherry Norman, Cummy Norman, Royal Wilding, Handsome Norman, Strawberry Norman, White Bache or Norman, Broad-leaved Norman, Argile Grise, Bramtôt, De Boutville, Fréquin Audière, Medalie d'Or, the last five being French sorts introduced from Normandy about 1880, and now established in the orchards of Herefordshire.

Pears.—Taynton Squash, Barland, Oldfield, Moorcroft or Malvern Hill, Red-pear, Thurston's Red, Longland, Pine pear.

No equally authoritative selection has been made for the Somerset and Devon districts, but the following varieties of cider apples are held in good repute in those parts:—Kingston Black, Jersey Chisel, Hangdowns, Fair Maid of Devon, Woodbine, Duke's Bill, Slack-my-Girdle, Bottle Stopper, Golden Ball, Sugar-loaf, Red Cluster, Royal Somerset and Cadbury (believed to be identical with the Royal Wilding of Herefordshire). As a rule the best cider apples are of small size. "Petites pommes, gros cidres.""}

Cider and perry not being taxable liquors in England, it is impossible to estimate with even an approach to accuracy the amount of the annual production of them. In 1866 Mr Sampson, the then secretary of the National Association of English Cider-makers, in his evidence before the royal commission on agriculture, put it at 553 million gallons. Since that date the increased demand for these native wines has given such an impetus to the industry that this figure might with safety be doubled. In France official statistics are available, and these show not only that that country is the largest producer of cider (including perry) in the world, but that the output is yearly increasing. A great proportion, however, of what passes as cider in France is boisson, i.e. cider to which water has been added in the process of making or at a subsequent stage; while much of the perry is disposed of to the makers of champagne. Although some cider is made in sixty-five departments, by far the largest amount comes from the provinces of Normandy and Brittany. In Germany cider-making is a considerable and growing industry. Manufactory is on a large scale in the north country, as at Guebwiller and Lunebourg, but the centre of the industry is at Frankfurt-am-Main, Hessenhausen and the neighbourhood, where there are five large and twenty-five small factories employing upwards of 1000 hands. Large quantities of cider fruit are imported from foreign countries, as, speaking generally, the native-grown fruit used in Germany for cider-making consists of inferior and undersized table apples not worth marketing. The bottled cider for export is treated much like champagne, and is usually fortified and flavoured until, in the words of an acknowledged French authority, M. Truelle, it becomes a hybrid between cider and white wine rather than pure cider.

The practice which formerly prevailed in England of making cider on the farm from the produce of the home orchards has within the last few years been to a large extent given up, and, as in Germany and many parts of France, farmers now sell the fruit to owners of factories where the making of cider and perry is carried on as a business of itself. In these hand or horse power is superseded by steam and sometimes by electricity, as in the factory of E. Seigel in Grünberg, and the old-fashioned appliances of the farm by modern mills and presses capable of turning out large quantities of liquor. The clearing of the juice, too, which used to be effected by running it through bags, is in the factories accomplished more quickly by forcing it through layers of compressed cotton in a machine of German origin known as Lumley's filter. The actual process of cider and perry making is simple, and resembles that of making grape wine. The fruit is ground or crushed in machines of various construction, the latest and most powerful being of American origin. The resulting pomace is pressed for the extraction of the juice, which is then run into vats, where it undergoes fermentation, which, converting the saccharine ingredients into alcohol and carbonic acid gas, turns it into cider. Cider made from a judicious mixture of several varieties of apples is to be preferred to cider made from Calvados, and generally, inasmuch as it is less difficult to find the requisite degrees of richness, astrinency and flavour in several varieties than in one; but the contrary is the case with pears, of which the most noted sorts, such as the Barland, the Taynton Squash and the Oldfield, produce the best perry when unmixed with other varieties. Some fining of an albuminous nature is generally requisite in order to clear the juice and facilitate its passage through the filter, but the less used the better. The simplest and cleanest is skim milk whipped to a froth and blended gradually with the cider as it is pumped into the mixing vat. Many nostrums are sold for the clearing of cider, but none is necessary and most are harmful.

Of late years the practice has largely obtained of using preservatives for the purpose of checking fermentation. The principal preservatives employed are salicylic and boracic acids and formalin. The two former are ineffective except in quantities likely to prove hurtful to health, while formalin, in itself a powerful and deleterious drug, though it stops fermentation, renders the liquor cloudy and undrinkable. Other foreign ingredients, such as saccharin and pectin, both coal-tar derivatives, and chenic acid, a French chemist, on whom it is named—are used by many makers, chiefly for the purpose of rendering bad and therefore unwholesome cider palatable and saleable. Provided that cider and perry be properly filtered, and attention paid to perfect cleanliness of vessels and appliances, there is no need of preservatives or sweeteners, and their use ought to be forbidden by law in England, as it is in most continental states in the case of liquors to be consumed within their borders, though not, it is significant to note, in the case of liquors intended for exportation.

The wholesome properties of cider and perry when pure and unadulterated have been recognized by medical men, who recommend them as pleasant and efficacious remedies in affections of a gouty or rheumatic nature, maladies which, strange to say, these very liquors were once supposed to foster, if not actually to originate. Under a similar false impression the notion is general that hard rough cider is apt to cause diarrhoea, colic and kindred complaints, whereas, as a fact, disorders of this kind are conspicuous by their absence in those parts of the country where rough cider and perry prevail, both being staple drinks of the working-classes. This is especially the case in Herefordshire, which is said also to be the only county in England whence no instance of the occurrence of Asiatic cholera has ever been reported.

The importance which the cider industry has of late attained in England has been marked by the establishment of the National Fruit and Cider Institute at Long Ashton near Bristol. This institute, founded in 1903 at the instance of the Board of Agriculture, is supported by grants from the board, the Bath and West of England Society, the councils of the cider-producing
CIENFUEGOS—CIGNANI

364

The cities of Hereford, Gloucester, Worcester, Monmouth, Devon, and Somerset, and by subscription of members. The objects of the institute are the promotion of research into the causes of the changes which occur in cider and perry during fermentation, with the view of imparting to these liquors a degree of exactitude hitherto unattainable; the adoption from time to time of improved machinery and methods in cider-making; the detection of adulteration; the giving of instruction in the principles and practice of cider-making; the publication of reports detailing the results of the researches undertaken at the institute; the testing and selection of the sorts of fruit best suited for vintage purposes; the propagation of useful varieties likely to neglect to go out of cultivation; and the conducting of experiments in regard to the best systems of planting and protecting young fruit trees.

Fruit-growers who look to cider-making "as a means of utilizing windfalls and small and inferior apples of cooking and dessert varieties not worth sending to market" should be warned that it is as important to the cider industry that good cider only should be sent as it is to the fruit-growing industry that good fruit only should be sent to market. The juice of the apple is naturally affected by the condition of the fruit itself, and if this be unripe, unsound or worm-eaten the cider made from it will be inferior to that made from full-grown, ripe and sound fruit. If such fruit be not good enough to send to market it will not only make a good cider itself, but will be good enough to place before the public. Nevertheless, it may furnish a sufficiently palatable drink for home consumption, and may therefore be so utilized. But when, as happens from time to time in fruit-growing districts, there is a glut, and even the best table fruit is unsaleable at a profit, then, indeed, cider-making is a means of storing in a liquid form what would otherwise be left to rot on the ground; whilst if a proportion of vintage fruit were mixed therewith, a drink would be produced which would not discredit the cider trade, and would bring a fair return to the maker. (C. W. R. C.)

CIENFUEGOS, NICASIO ÁLVAREZ DE (1764-1806), Spanish poet and publicist, was born at Madrid on the 14th of December 1764. He studied with distinction at Salamanca, where he met the poet Melendez Valdés. His poems, published in 1798, immediately attracted attention. He was successively editor of the Gaceta and Mercurio, and was condemned to death for having published an article against Napoleon; on the petition of his friends, he was respite and deported to France; he died at Orthez early in the following year. His verses are modelled on those of Melendez Valdés; though not of the same passion or passion, they are written by a spirited sentimentality and an easy philosophy of the age. Cienfuegos was famed for an unsparring use of both archaism and gallicisms. His plays, Pitaco, Zorra, La Condesa de Castilla and Idomeno, four tragedies on the pseudo-classic French model, and Las Hermanas generosas, a comedy, are deservedly forgotten.

CIENFUEGOS (originally FERNANDINA DE JÁGU) one of the principal cities of Cuba, in Santa Clara province, near the central portion of the S. coast, 115 m. E. S.E. of Havana. Pop. (1907) 30,100. Cienfuegos is served by the United railways and by steamers connecting with Santiago, Batabanó, Trinidad and the Isle of Pines. It lies about 6 m. from the sea on a peninsula in the magnificent landlocked bay of Jagua. Vessels drawing 16 ft. have direct access to the wharves. A circular railway about the water-front, wharves and warehouses facilitates the loading and unloading of vessels. The city streets are broad and regularly laid out. There is a handsome cathedral; and the Tomás Terry theatre (given to the city by the heirs of one of the millionaire sugar planters of the jurisdiction), the governor’s house (1841-1844), the military and government hospitals, market place and railway station are worthy of note. In the Cathedral Square (Plaza de Armas), embracing two city-squares, and shaded,—like all the plazas of the island—with laurels and royal palms, are a statue of Isabel the Catholic, and two marble lions given by Queen Isabella II; elsewhere there are statues of General Clout and Marshal Serrano, once captain-general. The city is lighted by gas and electricity, has an

abundant water-supply, and cable connexion with Europe, the United States, other Antilles and South America. The surrounding country is one of the prettiest and most fertile regions in Cuba, varied with woods, rivers, rocky gulches, beautiful cascades and charming tropical vegetation. Several of the largest and finest sugar estates in the world are situated in the vicinity, including the Soledad (with a botanical experiment station maintained by Harvard University), the Terry and others——most of them connected with the city by good driveways. Cienfuegos is a centre of the sugar trade on the south coast; tobacco too is exported.

The bay of Jagua was visited by Columbus. The city was founded in 1810, with the aid of the Spanish government, by a Louisiana, General Luis de Clout; it was destroyed by a hurricane and was rebuilt in 1825. Many naturalized foreign Catholics, including Americans, were among the original settlers. The settlement was first named in honour of Ferdinand VII., and later in honour of Captain-General José Cienfuegos Jovelanos. The harbour was known from the earliest times, and has been declared by Mahan to be the most important of the Caribbean Sea for strategic purposes. In 1740-1745 a fortification called Nuestra Señora de los Angeles was erected at the entrance; it is still standing, on a steep bluff overlooking the sea, and is one of the most picturesque of the old fortifications of the New World. On the 17th of May 1898 a force from the United States fleet under Admiral Schley, searching for Cervera and blocking the port, cut two of the three cables here (at Point Colorado, at the entrance of the harbour), and for the first time in the Spanish-American War the American troops were under fire.

CIEZA, a town of south-eastern Spain, in the province of Murcia, on the right bank of the river Segue, and on the Madrid-Cartagena railway. Pop. (1900) 13,626. Cieza is built in a narrow bend of the Segura valley, which is enclosed on the north by mountains, and on the south broadens into a fertile plain, producing grain, wine, olives, raisins, oranges and esparto grass. In the town itself there are flour and paper mills, sawmills and brandy distilleries. Between 1870 and 1900 local trade and population increased rapidly, owing partly to improved means of communication; and the appearance of Cieza is thoroughly modern.

CIGAR, the common term for tobacco-leaf prepared for smoking by being rolled into a short cylinder tapering to a point at which it is placed in the mouth. The other end, which is compressed into a round cake or square (see Tobacco), is known as the head, or as the tip. The Spanish cigarro is of doubtful origin, possibly connected with ceyara, a cicada, from its resemblance to the body of that insect, or with cigarol, a word of Arabic origin meaning a pleasure garden. The explanation that it comes from a Cuban word for a certain species of tobacco is probably erroneous, since no native word of the kind is known. The diminutive, cigarette, denotes a roll of cut tobacco enclosed usually in thin paper, but sometimes also in tobacco-leaf or the husk of Indian corn.

CIGNANI, CARLO (1628-1719). Italian painter, was born of a noble family at Bologna, where he studied under Battista Cairo, and afterwards under Francesco Albani. Though an intimate friend of the latter, and his most famous disciple, Cignani was yet strongly and deeply influenced by the genius of Correggio. His greatest work, moreover, the "Assumption of the Virgin," round the cupola of the church of the Madonna della Cuota at Forli, which occupied him some twenty years, and is in some respects one of the most remarkable works of art of the 17th century, is obviously inspired from the more renowned fresco of Correggio in the cupola of the cathedral of Parma. Cignani had some of the defects of his masters: his elaborate finish, his obvious artificiality in the use of colour and in composition, mark the disciple of Albani; but he imparted to his work a more intellectual character than either of his models, and is not without other remarkable merits of his own. As a man Cignani was eminently amiable, unsparing and generous. His success, however, made him many enemies; and the envy of some of these is said to have impelled them to deface certain of his works.
He accepted none of the honours offered him by the duke of Parma and other princes, but lived and died an artist. On his return to Forli, where he died, the school he had founded at Bologna was fain in some sort to follow its master. His most famous pupils, in addition to the Assumption already cited, are—the Entrance of Paul III. into Bologna”; the “François I. Touching for King’s Evil”; “a Power of Love,” painted under a fine ceiling by Agostino Carracci, on the walls of a room in the ducal palace at Parma; an “Adam and Eve” (at the Hague); and two of “Joseph and Potiphar’s Wife” (at Dresden and Copenhagen). His son Felice (1660-1724) and nephews Paolo (1709-1764) were also painters.

**CIGOLI** (or Cigli), LODOVICO CARDI DA (1539-1613), Italian painter, architect and poet, was born at Cigoli in Tuscany. Educated under Alessandro Allori and Santi di Tito, he formed a peculiar style by the study at Florence of Michelangelo, Correggio, Andrea del Sarto and Pontormo. Assimilating more of the second of these masters than of all the others, he laboured for some years with success; but the attacks of his enemies, and intense application to the production of a wax model of certain anatomical preparations, induced an alienation of mind which affected him for three years. At the end of this period he visited Lombardy, whence he returned to Florence. There he painted an “Ecce Homo,” in competition with Passignani and Caravaggio, which gained the prize. This work was afterwards taken by Bonaparte to the Louvre, and was restored to Florence in 1815. Other important pictures are—a “St Peter Healing the lame man,” in St Peter’s at Rome; a “Conversion of St Paul,” in the church of San Paolo fuori le Mura, and a “Story of Psyche,” in fresco, at the Villa Borghese; a “Martyrdom of Stephen,” which earned him the name of the Florentine Correggio, a “Venus and Satyr,” a “Sacrifice of Isaac,” a “Stigmata of St Francis,” at Florence. Cigoli, who was made a knight of Malta at the request of Pope Paul III., was a good and solid draughtsman and the possessor of a rich and harmonious palette. He died, it is said, of grief at the failure of his last fresco (in the Roman church of Santa Maria Maggiore), which is rendered ridiculous by an abuse of perspective.

**CILIA** (plural of Lat. cilium, eyelash), in biology, the thread-like processes by the vibration of which many lowly organisms, or the male reproductive cells of higher organisms, move through water.

**CILIATA** (M. Pertz), one of the two divisions of Infusoria, characterized by the permanent possession of cilia or organs derived from these (cirri, membranelles, &c.), and possessing a single mouth (except in the Opalinopsisae, all parasitic). They are the most highly differentiated among the Protozoa.

**CILICIA**, in ancient geography, a district of Asia Minor, extending along the south coast from the Alara Su, which separated it from Pamphylia, to the Gavur Dag (Mt. Amanos), which parted it from Syria. Its northern limit was the crest of Mt. Taurus. It was naturally divided into Cilicia Trachae, W. of the Lamas Su, and Cilicia Pedias, E. of that river.

Cilicia Trachae is a rugged mountain district formed by the spurs of Taurus, which often terminate in rocky headlands with small sheltered harbours,—a feature which, in classical times, made the coast a resort of pirates, and, in the middle ages, led to its occupation by Genoese and Venetian traders. The district is watered by the Geuk Su (Calycadnus and its tributaries), and is covered to a large extent by forests, which still, as of old, supply timber to Egypt and Syria. There were several towns but no large trade centres. In the interior were Coropissus (Da Bazar), Olba (Uzunjabur), and, in the valley of the Calycadnus, Claudipolis (Mut) and Germanicopolis (Ermene). On or near the coast were Conesium (Alaya), Silvius Trajanopolis (Selieti) Anemontium (Anamur), Kelerdens (Kilindria), Seluecia ad Calycadnus (Selekeh), Corycus (Korghos) and Elaeus-Sebaste (Ayash). Roads connected Laranda, north of the Taurus, with Kelerdens and Seluecia.

Cilicia Pedias included the rugged spurs of Taurus and a large plain, which consists, in great part, of a rich stoneless loam. Its eastern half is studded with isolated rocky crags, which are crowned with the ruins of ancient strongholds, and broken by the low hills that border the plain of Issus. The plain is watered by the Cydnus (Tarsus Chai), the Sarus (Sihum) and the Pyramus (Jihburn), each of which brings down much silt. The Sarus now enters the sea almost due south of Tarsus, but there are clear indications that at one period it joined the Pyramus, and that the united rivers ran to the sea west of Kara-tash. Such appears to have been the case when Alexander’s army crossed Cilicia. The plain is extremely productive, though now little cultivated. Through it ran the great highway, between the east and the west, on which stood Tarsus on the Cydnus, Adana on the Sarus, and Mopsuestia (Missis) on the Pyramus. North of the road between the two last places were Sision-Flaviopolis (Sis), Anazarbus (Anazarba) and Hierapolis-Kastabala (Budrum); and on the coast were Soli-Pompeiopolis, Mallus (Kara-tash), Aegae (Ayash), Issus, Baiae (Piyas) and Alexandria ad Issum (Alexandretta). The great highway from the west, on its long rough road, ran to the Anatolian plateau to Tarsus, ran through a narrow pass between walls of rock called the Cilician Gate, on the coast opposite, the pass, between walls of rock, now called the Cilician Gate, Ghulke Boghaz. After crossing the low hills east of the Pyramus it passed through a monastery (Cilician) gate, Demir Kapu, and entered the plain of Issus. From that plain one road ran southward through a monastery (Syrian) gate to Alexandretta, and thence crossed Mt. Amanos by the Syrian Gate, Beilan Pass, to Antioch and Syria; and another ran northwards through a monastery (Amanian) gate, south of Toprak Kaleh, and crossed Mt. Amanos by the Amanian Gate, Bagche Pass, to North Syria and the Euphrates. By the last pass, which was apparently unknown to Alexander, Darius crossed the mountains prior to the battle of Issus. Both passes are short and easy, and connect Cilicia Pedias geographically and politically with Syria rather than with Asia Minor. Another important road connected Sision with Cocosus and Melitene. In Roman times Cilicia exported the goat’s hair cloth, Cilicium, of which tents were made.

The Cilicians appear as Khilkiku in Assyrian inscriptions, and in the early part of the first millennium B.C. were one of the four chief powers of western Asia. It is generally assumed that they had previously been subject to the Syro-Phoenician empire; but, up to 1900 at all events, “Hittite” monuments had not been found in Cilicia; and we must infer that the “Hittite” civilizations which flourished in Cappadocia and N. Syria, communicated with each other by passes E. of Amanos and not by the Cilician Gates. Under the Persian empire Cilicia was apparently governed by tributary native kings, who bore a name or title gracezed as Syennesis; but it was officially included in the fourth satrapy of Darius. Xenophon found a queen in power, and no opposition was offered to the march of Cyrus. Similarly Alexander found the Gates open, when he came down from the plateau in 333 B.C.; and from these facts it may be inferred that the great pass was not under direct Persian control, but under that of a vassal power always ready to turn against its suzerain. After Alexander’s death it was long a battle ground of rival marshals and kings, and for a time fell under Ptolemaic dominion, but finally under that of the Seleucids, who, however, never held effectually more than the eastern half. Cilicia Trachae became the haunt of pirates, who were subdued by Pompey. Cilicia Pedias became Roman territory in 103 B.C., and the whole was organized by Pompey, 64 B.C., into a province which, for a short time, extended to and included part of Phrygia. It was reorganized by Caesar, 47 B.C., and about 27 B.C. became part of the province Syria-Cilicia-Phoenice. At first the western district was left independent under native kings or priest-dynasts, and a small kingdom, under Tarkondimotus, was left in the east; but these were finally united to the province by Vespasian, A.D. 74. Under Diocletian (cera 298), Cilicia, with the Syrian and Egyptian provinces, formed the Diocesis Orientis. In the 7th century it was invaded by the Arabs, who held the country until it was reoccupied by Nicephorus II. in 965.

The Seljuk invasion of Armenia was followed by an exodus of Armenians southwards, and in 1080 Rupen, a relative of the last king of Ani, founded in the heart of the Cilian Taurus a small
principalities, which gradually expanded into the kingdom of Lesser Armenia. This Christian kingdom—situated in the midst of Moslem states, hostile to the Byzantines, giving valuable support to the crusaders, and trading with the great commercial cities of Italy—had a stormy existence of about 300 years. Gosdatin I. (1095-1100) assisted the crusaders on their march to Antioch, and was created king and marquis. Thors I. (1100-1123), in alliance with the Christian princes of Syria, waged successful war against Byzantines and Seljuks. Levon (Leo) II., “the Great” (1185-1219), extended the kingdom beyond Mount Taurus and established the capital at Sis. He assisted the crusaders, was crowned king by the archbishop of Mainz, and married one of the Lusignans of Cyprus. Haiithin I. (1224-1260) made an alliance with the Mongols, who, before their adoption of Islam, protected his kingdom from the Mamelukes of Egypt. When Levon V. died (1342), John of Lusignan was crowned king as Gosdatin IV.; but he and his successors alienated the Armenians by attempting to make them conform to the Roman Church, and by giving all posts of honour to Latins, and at last the kingdom, a prey to internal dissensions, succumbed (1375) to the attacks of the Egyptians. Cilicia Trachena was occupied by the Ottoman in the 15th century, but Cilicia was restored to the empire in 1456. From 1833 to 1840 Cilicia formed part of the territories administered by Mehemet Ali of Cairo, who was compelled to evacuate it by the allied powers. Since that date it has formed the vilayet of Adana (q.v.).

**CILLI—CIMABUE**

**CILLI** (Slovene, Celje), a town in Styria, Austria, 82 m. S. by W. of Graz by rail. Pop. (1900) 6743. It is picturesquely situated on the left bank of the river Sann, and still has remains of the old walls and towers, with which it was once surrounded. Memorials of a still earlier period in its history—Roman antiquities—are to be seen in the municipal museum, while its canals and sewers are also of Roman origin. These were discovered during the second half of the 19th century, and were in such a good state of preservation that after a few small repairs they are now utilized. The parish church, dating from the 14th century, with its beautiful Gothic chapel, is one of the most interesting specimens of medieval architecture. The so-called German church, in Romanesque style, belonged to the Minorite monastery, founded in 1241 and closed in 1808. The throne of the counts of Cilli is preserved here, and also the tombs of several members of the family. On the Schlossberg (1320 ft.), situated to the S.E. of the town, are the ruins of the castle of Ober-Cilli, the former residence of the counts of Cilli. Ten miles to the N.W. of Cilli are situated the baths of Neuhaus, with indifferent thermal waters (107° F.), frequented by ladies. Not far from Cilli is the ruin of Neuhaus, called since 1643 Schlangenburg, from which an extensive view of the neighbouring Alps is obtained.

Cilli is one of the oldest places in Styria, and was probably a Celtic settlement. It was taken possession of by the Romans in 15 B.C., and in A.D. 50 the emperor Claudius raised it to a Roman municipium and named it Claudia Celaea. It soon became one of the most flourishing Roman colonies, and possessed numerous great buildings, of which the temple of Mars was famous throughout the whole empire. It was incorporated with Aquileia, under Constantine; and towards the end of the 6th century it was destroyed by the invading Slavs. It had a period of exceptional prosperity from the middle of the 14th to the latter half of the 15th century, under the counts of Cilli, on the extinction of which family it fell to Austria. In the 16th century it suffered greatly both from revolts of the peasantry and from the Counter-Reformation, Protestantism having made many converts in the district, particularly among the nobles.

See Glantschnig, *Celae* (Cilli, 1892).

**CIMABUE, GIOVANNI** (1240 to about 1302), Italian painter, was born in Florence of a respectable family, which seems to have borne the name of Gualtieri, as well as that of Cimabue (Bullhead). He took to the arts of design by natural inclination, and sought the society of men of learning and accomplishment. Vasari, the historian of Italian painting, zealous for his own native state of Florence, has left us the generally current account of Cimabue, which later researches have to a great extent validated. We cannot now accept his assertion that art, extinct in Italy, was revived solely by Cimabue, after he had received some training from Greek artists invited by the Florentine government to paint the chapel of the Gondi in the church of S. Maria Novella; for native Italian art was not then a nullity, and this church was only begun when Cimabue was already forty years old. Even Lanzi's qualifying statement that Greek artists, although they did not paint the chapel of the Gondi, did execute rude decorations in a chapel below the existing church, which were afterwards rejected, is highly questionable. If they have inspired Cimabue, makes little difference in the main facts. What we find as the general upshot is that some Italian painters preceded Cimabue—particularly Guido of Siena and Giunta of Fisa; that he worked on much the same principle as they, and to a like result; but that he was nevertheless the most advanced master of his time, and, by his own works, and the training which he imparted to his mighty pupil Giotto, he left the art far more formed and more capable of growth than he found it (see Painting).

The undoubted admiration of his contemporaries would alone demonstrate the conspicuous position which Cimabue held, and deserved to hold. For the chapel of the Rucellai in S. Maria Novella he painted in tempera a colossal “Madonna and Child with Angels,” the largest altarpiece produced up to that date: Sylvia and other contemporaries upon him must be read with caution.

**CILLI, ULRICH**, COUNT OF (1406-1456), son of Frederick II., count of Cilli, and Elizabeth Franzen. Of his youth we know nothing certain. About 1432 he married Catherine, daughter of George Blankovich, despot of Servia.

His influence in the troubled affairs of Hungary and the Empire early overshadowed that of his father, together with whom he was made a prince of the Empire by the emperor Sigismund (1436). Hence feuds with the Habsburgs, wounded in their rights as overlords of Cilli, ending, however, in an alliance with the Habsburg king Albert II., who made Ulrich for a short while his lieutenant in Bohemia. After Albert's death (1439) Ulrich took up the cause of his widow Elizabeth, and presided at the coronation of her infant son Ladislaus V. Posthumus (1440). A feud with the Hunyadis followed, embittered by John Hunyadi's attack on George Blankovich of Servia (1444) and his refusal to recognize Ulrich's claim to Bosnia on the death of Stephen Tvtro (1443). In 1446 Hunyadi, now governor of Hungary, harried the Cilli territories in Croatia-Slavonia; but his power was broken at Kossovo (1448), and Count Ulrich was able to lead a successful crusade, nominally in the Habsburg interest, into Hungary (1450). In 1452 he forced the emperor Frederick III. to hand over the boy king Ladislaus V. to his keeping, and became thus practically ruler of Hungary. In 1454 his power was increased by his succession to his father's vast wealth; and in 1456 he was named by Ladislaus his lieutenant in Hungary. The Hunyadis now conspired to destroy him. On the 8th of November, in spite of warnings, he entered Belgrade with the king; the next day he was attacked by Laszlo Hunyadi and his friends, and done to death. With him died the male line of the counts of Cilli.

Count Ulrich's ambition was boundless, his passions unbridled; but the hostile judgments passed by Aeneas Sylvius and other contemporaries upon him must be read with caution.
before its removal from the studio it was visited with admiration by Charles of Anjou, with a host of eminent men and gentle ladies, and it was carried to the church in a festive procession of the people and trumpeters. Cimabue was at this time living in the Borgo Allegri, then outside the walls of Florence; the legend that the name Allegri (Joyous) was bestowed on the locality in consequence of this striking popular display is more attractive than accurate, for the name existed already. Of this celebrated picture, one of the great landmarks of modern and sacred art, some details may be here given, which we condense from the History of Painting in Italy by Crowe and Cavalcaselle.

"The Virgin in a red tunic and blue mantle, with her feet resting on an open-worked stool, is sitting on a chair hung with a white drapery, and is placed in a gold and blue, and carried by six angels kneeling in threes above each other. A delicately engraved nimbus surrounds her head, and that of the infant Saviour on her lap, who is dressed in a white tunic, and purple mantle shot with gold. A dark-coloured frame surrounds the gabled square of the picture, delicately traced with an ornament interrupted at intervals by thirty medallions on gold ground, each of which contains the half-figure of a saint. In the face of the Madonna is a soft and melancholy expression; in the form of the infant, a certain freshness, animation and natural proportion; in the group, affection—but too rare at this period. There is sentiment in the attitudes of the angels, energetic mien in some prophets, comparative clearness and soft harmony in the colours caused by the overlay of the beautiful of the head in the Virgin as compared with the slightness of her frame. The features are the old ones of the 13th century; only softened, as regards the expression of the eye, by an exaggeration of elliptical form in the faces, and looseness of the folds of the drapery. The absence of all true notions of composition may be considered striking; yet their movements are more natural and pleasing than hitherto. One indeed, to the spectator's right of the Virgin, combines the features that one might have it in his mind to produce. Cimabue gave to the flesh-tints a clear and carefully fused colour, and imparted to the forms some of the rotundity which they had lost. With him vanished the sharp contrasts of hard lights, half-tones and shadows."

In a general way, it may be said that Cimabue showed himself forcible in his paintings, as especially in heads of aged or strongly characterized men; and, if the then existing development of art had allowed of this, he might have had it in his mind to produce the beautiful as well. He, according to Vasari, was the first painter who wrote words upon his paintings,—as, for instance, round the head of Christ in a picture of the Crucifixion, the words addressed to Mary, Mulier ecce filius tuus.

Other paintings still extant by Cimabue are the following:—

In the academy of Arts in Florence, a "Madonna and Child," with eight angels, and some prophets in niches,—better than the Rucellai picture in composition and study of nature, but more archaic in type, and the color now spoiled (this work was painted for the Badia of St. Trinity, Florence); in the National Gallery, London, a "Madonna and Child with Angels," which came from the Ugo Baldi collection, and had probably once been in the church of S. Croce, Florence; in the Louvre, a "Madonna and Child," with twenty-six medallions in the frame, originally in the church of S. Francesco, Pisa. In the lower church of the Basilica of S. Francesco at Assisi, Cimabue succeeding Giunta da Pisa, probably adorned the south transept, painting a colossal Madonna of the Virgin above the altar of the Conception, and a large figure of St Francis. In the upper church, north transept, he has the "Saviour Enthroned and some Angels," and, on the central ceiling of the transept, the "Four Evangelists with Angels." Many other works in both the lower and the upper church have been ascribed to Cimabue, but with very scanty evidence; even the above-named can be assigned to him only as matter of probability. Numerous others which he indisputably did paint have perished,—for instance, a series (earlier in date than the Rucellai picture) in the Carmine church at Padua, which were destroyed by a fire.

From Assisi Cimabue returned to Florence. In the closing years of his life he was appointed capomastro of the mosaics of the cathedral of Pisa, and was afterwards, hardly a year before his death, joined with Arnolfo di Cambio as architect for the cathedral of Florence. In Pisa he executed a Majesty of the apostle,—" Christ in glory between the Virgin and John the Evangelist," a mosaic, now much damaged, which stamps him as the leading artist of his time in that material. This was probably the last work that he produced.

The debt which art owes to Cimabue is not limited to his own performances. He was the master of Giotto, whom (such as least is the tradition) he found a shepherd boy of ten, in the pastures of Vespignano, drawing with a coal on a slate the figure of a lamb. Cimabue took him to Florence, and instructed him in the art; and after his death Giotto occupied a house which had belonged to his master in the Via del Cocomero. Another painter with whom Cimabue is said to have been intimate was Gaddo Gaddi.

It had always been supposed that the bodily semblance of Cimabue is preserved to us in a portrait-figure by Simon Memmi painted in the Cappella degli Spagnuoli, in S. Maria Novella,—a thin hooded face in profile, with small beard, reddish and pointed. This is, however, extremely dubious. Simone Martini of Siena (commonly called Memmi) was born in 1283, and would therefore have been about nineteen years of age when Cimabue died; it is not certain that he painted the work in question, or that the figure represents Cimabue. The Florentine master is seen in the presence of a nurse in an original painting by Donzio (the so-called Anonimo, who wrote about 1334) as arrogante e disdegno; so "arrogant and scornful" that, if any one, or if he himself, found a fault in any work of his, however cherished till then, he would abandon it in disgust. This, however, to a modern mind, looks more like an aspiring and fastidious desire for perfection than any such form of "arrogance and scorn" as blemishes a man's character. Giovanni Cimabue was buried in the cathedral of Florence, S. Maria del Fiore, with an epitaph written by one of the Nini:—

"Credidit ut Cimabae picture castra tenerae, Sic tenuit vivens; nunc tenui astra polii."

Here we recognize distinctly a parallel to the first clause in the famous triplet of Dante:—

"Credette Cimabae nella pintauro, Tener lo campo; ed ora ha Giotto il grido, Si che la fama col solu' osecura."

Besides Vasari, and Crowe and Cavalcaselle (re-edited by Langton), the following works may be consulted:—P. Angeli, Storia della basilica d' Assisi; Cole and Stillman, Old Italian Masters (1824); Mrs Ady, Painters of Florence (1900).

(C. M. R.)

CIMAROSA, DOMENICO (1749-1801), Italian musical composer, was born at Aversa, in the kingdom of Naples, on the 17th of December 1749. His parents were poor, but anxious to give their son a good education; and after removing to Naples they sent him to a free school connected with one of the monasteries of that city. The organist of the monastery, Padre Polciano, was struck with the boy's intellect, and voluntarily instructed him in the elements of music, as also in the ancient and modern literature of his country. To his influence Cimarosa owed a free scholarship at the musical institute of Santa Maria di Loreto, where he remained for eleven years, studying chiefly the great masters of the old Italian school. Piccini, Sacchini and other musicians of repute are mentioned amongst his teachers. At the age of thirty he became a first-rate dramatist and conductor with a comic opera called Le Stravagante del Conde, first performed at the Teatro dei Fiorentini at Naples in 1772. The work met with approval, and was followed in the same year by Le Pansie di Stelidamano e di Zoroastro, a farce full of humour and eccentricity. This work also was successful, and the fame of the young composer began to spread all over Italy. In 1774 he was invited to Rome to write an opera for the stagione of that year; and he there produced another comic opera called L'Italiana in Londra.

The next thirteen years of Cimarosa's life are not marked by any event worth mentioning. He wrote a number of operas for the various theatres of Italy, living temporarily in Rome, in Naples, or wherever else his vocation as a conductor of his works happened to call him. From 1784-1787 he lived at Florence, writing exclusively for the theatre of that city. The productions of this period of his life are very numerous, consisting of operas, both comic and serious, cantatas, and various sacred
CIMBRI—CIMON

Compositions. The works may be mentioned amongst many others:—Caio Mario; the three biblical operas, Assolone, La Gwendola and Il Sacrofago d’Abramo; also Il Consilio di Pietra; and La Ballerina amante, a pretty comic opera first performed at Venice with enormous success.

About the year 1788 Cimarosa went to St Petersburg by invitation of the empress Catherine II. At her court he remained four years and wrote an enormous number of compositions, mostly of the nature of pièces d’occasion. Of most of these not even the names are on record. In 1792 Cimarosa left St Petersburg, and went to Vienna at the invitation of the emperor Leopold II. Here he produced his masterpiece, Il Matrimonio segreto, which ranks amongst the highest achievements of light operatic music. In 1793 Cimarosa returned to Naples, where Il Matrimonio segreto and other works were received with great applause. Amongst the works belonging to his last stay in Naples may be mentioned the charming opera Le Astuzie femminili. This period of his life is said to have been embittered by the intrigues of envious and hostile persons, amongst whom figured his old rival Paisiello. During the occupation of Naples by the troops of the French Republic, Cimarosa joined the liberal party, and on the return of the Bourbons, was, like many of his political friends, condemned to death. By the intercession of influential admirers his sentence was commuted into banishment, and he left Naples with the intention of returning to St Petersburg. But his health was broken, and after much suffering he died at Venice on the 11th of January 1801, of inflammation of the intestines. The nature of his disease led to the rumour of his having been poisoned by his enemies, which, however, a formal inquest proved to be unfounded. He worked till the last moment of his life, and one of his operas, Arteodamia, remained unfinished at his death.

CIMBRI, a Teutonic tribe who made their first appearance in Roman history in the year 113 B.C., when they defeated the consul Gnaeus Papirius Carbo near Alcium, in the modern Carcass. It was the common belief that they had been driven from their homes on the North Sea by inundations, but, whatever was the cause of their migration, they had been wandering along the Danube for some years warring with the Celtic tribes on either bank. After the victory of 113 they passed westwards over the Rhine, threatening the territory of the Allobroges. Their request for land was not granted, and in 109 B.C. they defeated the consuls Marcus Junius Silanus in southern Gaul, but did not at once follow up the victory. In 105 they returned to the attack under their king Boiorix, and vanquished by the dissensions of the Roman commanders Gnaeus Mallius Maximus and Caepio, defeated them in detail and annihilated their armies at Arausio (Orange). Again the victorious Cimbri turned away from Italy, and, after attempting to reduce the Arverni, moved into Spain, where they failed to overcome the desperate resistance of the Celtiberian tribes. In 103 they marched back through Gaul, which they overran as far as the Seine, where the Belgae made a stout resistance. Near Rouen the Cimbri were reinforced by the Teutoni and two cantons of the Helvetii. Thereupon the host marched southwards by two routes, the Cimbri moving on the left towards the passes of the Eastern Alps, while the newly arrived Teutoni and their allies made for the western gates of Italy. In 102 B.C. the Teutoni and Ambrones were totally defeated at Aquae Sextiae by Marius, while the Cimbri succeeded in passing the Alps and driving Q. Lutatius Catulus across the Adige and Po. In 101 Marius overthrew them on the Raudine Plain near Vercellae. Their king Boiorix was killed and the whole army destroyed. The Cimbri were the first in the line of the Teutonic invaders of Italy.

The original home of the Cimbri has been much disputed. It is recorded in the Monumentum Ancyranum that a Roman fleet sailed eastwards from the mouth of the Rhine (c. A.D. 9) receiving the farther points of the Rhine which were called Cimbri, who sent an embassy to Augustus. Several early writers agree in saying that the Cimbri occupied a peninsula, and in the map of Ptolemy Jutland appears as the Cimbri Chersonese. As Ptolemy seems to have regarded the district north of the Lümфjord (Limfjord) as a group of islands, the territory of the Cimbri, the northernmost tribe of the peninsula, would be included in the modern county (Am) of Aalborg. This was formerly called Himbersyssel or Himmerland, forms which may very well preserve their name, especially as the name Charydes, mentioned next to them in the Monumentum Ancyranum, appears to survive in the modern Hardland. Possibly also the district across the Lümфjord formerly called Thysyssel or Thylay may in the same way preserve the name of the Teutoni (q.v.). Strabo and other early writers relate a number of curious facts concerning the customs of the Cimbri, which are of great interest as the earliest records of the manner of life of the Teutonic nations.

CIMICIFUGA, in botany, a small genus of herbaceous plants, of the natural order Ranunculaceae, which is widely distributed in the north temperate zone. C. foetida, bugbane, is used as a preventive against vermin; and the root of a North American species, C. racemosa, known as black snake-root, as an emetic.

CIMMERII, an ancient people of the far north or west of Europe, first spoken of by Homer (Odyssey, x. 12-15), who describes them as living in perpetual darkness. Herodotus (iv. 11-13), in his account of Scythia, regards them as the early inhabitants of South Russia (after whom the Bospourus Cimmerii [q.v.] and other places were named), driven by the Scyths along the Caucasus into Asia Minor, where they maintained themselves for a century. But the Cimmerii are often mentioned in connexion with the Thracian Trebes who made their raids across the Hellespont, and it is quite possible that some Cimmerii took this route, having been cut off by the Scyths as the Alani (q.v.) were by the Huns. Certain it is that In the middle of the 7th century B.C., Asia Minor was ravaged by northern nomads (Homer, Odyssey, xii. 177), and body of whom is buried in the Gimirrai and is represented as coming through the Caucasus. They were probably Iranian speakers, to judge by the few proper names preserved. The name has also been identified with the biblical Gomer, son of Japheth (Gen. x. 2, 3). To the north of the Euxine their main body was merged in the invading Scyths. Later writers identified them with the Cimbri of Jutland, who were probably Teutonized Celts, but this is a mere guess due to the similarity of name. The Homeric Cimmerii belong to an early part of the Odyssey in which the hero was conceived as wandering in the Euxine; these adventures were afterwards translated to the western Mediterranean in accordance with a wider geographical outlook.

For the Cimmerian invasions described by Herodotus, see SCYTHIA; LYDIA; GYPSIS.

CIMON [Kimon] (c. 507-449), Athenian statesman and general, was the son of Miltiades (q.v.) and Helespyle, daughter of the Thracian prince Olorus. Miltiades died in disgrace, leaving unpaid the fine imposed upon him for his conduct at Paros. Cimon's first task in life, therefore, was to remove the stain on the family name by paying this fine (about £12,000). In the second Persian invasion, especially at Salamis, and in the consolidation of the Delian League, he won a high reputation for courage and integrity. At first with Aristides, and afterwards as sole commander, he directed the Athenian contingent of the fleet; on the disgrace of Pausanias he practically commanded the entire Greek fleet and drove Pausanias from his retreat in Byzantium. Having captured Eion (at the mouth of the Strymon), he expelled the Persian garrisons from the entire seaboard of Thrace with the exception of Doriscus, and, having defeated the piratical Dolopians of Scyros (476), confirmed his popularity by transferring thence to Athens the supposed bones of the Attic hero Theseus. The bones were buried in Athens, and over the tomb the Thesmophoria (temple) was erected. About 456 Cimon proceeded to liberate the Greek cities of Lydia and Pamphylia, and at the mouth of the Eurymedon he defeated the Persians decisively by land and sea.
The Persian danger was now over, and the immediate purpose of the Delian League was achieved. Already, however, Athens had introduced the policy of coercion which was to transform the league into an empire, a policy which, after the ostracism of Themistocles and the death of Aristides, must be attributed to Cimon, whose fundamental idea was the union of the Greeks against all outsiders (so DELIAN LEAGUE). Carystus was compelled to join the league; Naxos (c. 469) and Thasos (465–463), which had revolted, were compelled to accept the position of tributary allies. In 464 Sparta was involved in war with her Helots (principally of Messenian origin) and was in great difficulties. Cimon, then the most prominent man in Athens, persuaded the Athenians to send assistance, on the ground that Athens could not "stand without her yoke-fellow" and leave "Hellas lame." The expedition was a failure, and Cimon was exposed to the attacks of the democrats led by Ephialtes. The history of this party struggle is not clear. The ordinary account is that Ephialtes during Cimon's absence in Mesenia destroyed the powers of the Areopagus (q.v.) and then obtained the ostracism of Cimon, who attempted to reverse his policy. Without going fully into the question, which is full of difficulty, it may be pointed out (1) that when the Mesenian expedition started Cimon had twice within the preceding year triumphed over the opposition of Ephialtes, and (2) presumably the Cimonian party was predominant until after the expedition's failure. It is therefore unlikely that, immediately after Cimon's triumph in obtaining permission to go to Mesenia, Ephialtes was able to attack the Areopagus with success. The probability is that when the expedition failed, Cimon was ostracized, and that then Ephialtes defeated the Areopagus, and also made a change in foreign policy by making alliances with Sparta's enemies, Argos and Thessaly. This hypothesis alone explains the absence of any account of a third struggle between Cimon and Ephialtes over the Areopagus. The chronology would thus be: ostracism of Cimon, spring, 461; fall of the Areopagus and reversal of Philo-Laconic policy, summer, 461.

A more difficult question is involved in the date of Cimon's return from ostracism. The ordinary account says that he was recalled after the battle of Tanagra (457) to negotiate the Five Years' Truce (451 or 450). To ignore the unexplained interval of six or seven years is an uncritical expedient, which, however, has been adopted by many writers. Some maintaining that Cimon did return soon after 457, say that the truce which he arranged was really the four months' truce recorded by Diodorus (only). To this there are two objections: (1) If Cimon returned in 457, why does the evidence of antiquity connect his return specifically with the truce of 457? and (2) why does he after 457 disappear for six years and return again to negotiate the Five Years' Truce and to command the expedition to Cyprus? It seems much more likely that he returned in 451, at the very time when Athens returned to his old policy of friendship with Sparta and war in the East against Persia (i.e. the Cyprus expedition). Thus it would appear that from 453 onwards there was a recrudescence of conservative influence, and that for four years (453–449) Pericles was not master in Athens (see PERICLES); this theory is corroborated by the fact that Pericles, in the alarm caused by the Egyptian failure of 454, was induced to remove the Delian treasury to Athens and to abandon his anti-Spartan policy of land empire.

Cimon died in Cyprus before the walls of Cithon (449), and was buried in Athens. Later Attic orators speak in glowing terms of a "Peace" between Athens and Persia, which is sometimes connected with the name of Cimon and sometimes with that of Callias. If any such peace was concluded, it cannot have been soon after the battle of the Eurymedon as Plutarch assumes. It can have been only after Cimon's death and the evacuation of Cyprus (i.e. c. 448). It is only in this view that the story has been maintained logically in modern times. Apart from the fact that the peace is ignored by Thucydides and that the latest reference to it is the passage in Isocrates (Ponses, 118 and 120), there are weighty reasons which render it improbable that any formal peace can have been concluded at that period between Athens and Persia (see further Ed. Meyer's Forschungen, ii.).

Cimon's services in connexion with the consolidation of the Empire rank with those of Themistocles and Aristides. He is described as genial, brave and generous. He threw open his house and gardens to his fellow-dememmen, and beautified the city with trees and buildings. But as a statesman he failed to cope with the new conditions created by the democracy of Cleisthenes. The one great principle for which he is memorable is that of the balance of power between Athens and Sparta, as respectively the naval and military leaders of a united Hellas. It has been the custom to regard Cimon as a man of little culture and refinement. It is clear, however, from his desire to adorn the city, that he was by no means without culture and imagination. The truth is that, as in politics, so in education and attitude of mind, he represented the ideals of an age which, in the new atmosphere of democratic Athens, seemed to savour of rusticity and lack of education.

The lives of Cimon by Plutarch and Cornelius Nepos are uncritical; the conclusions above expressed are derived from a comparison of Plutarch, Cimon, 17, Pericles, 10; Theopompos, fragm. 62; Andocides, de Pace, §§ 3, 4; Diodorus xi. 86 (the four months' truce). See histories of Greece (e.g. Grote, ed. 1907, 1 vol.); also PERICLES, ii. 16; J. M. M.

CIMON OF CLEONAE, an early Greek painter, who is said to have introduced great improvements in drawing. He represented "figures out of the straight, and ways of representing faces looking back, up or down; he also made the joints of the body clear, emphasized veins, worked out folds and doublings in garments" (Pliny). All these improvements are such as may be traced in the drawing of early Greek red-figured vases (see GREEK ART).

CINCHONA, the generic name of a number of trees which belong to the natural order Rubiaceae. Botanically the genus includes trees of varying size, some reaching an altitude of 80 ft. and upwards, with evergreen leaves and deciduous stipules. The flowers are arranged in panicles, white or pinkish in colour, with a pleasant odour, the calyx being 5-toothed superior, and the corolla tubular, 5-lobed and fringed at the margin. The stamens are 5, almost concealed by the tubular corolla, and the ovary terminates in a fleshy disk. The fruit is an ovoid or sub-cylindrical capsule, splitting from the base, and held together at the apex. The numerous seeds are flat and winged all round. About 40 species have been distinguished, but of these not more than about a dozen have been economically utilized. The plants are natives of the western mountainous regions of South America, with the most extended range, extending from 16° S. to 52° S. lat.; and they flourish generally in the elevation of from 2000 to 5000 ft. above sea-level, although some have been noted growing as high as 11,000 ft., and others have been found down to 2600 ft.

The trees are valued solely on account of their bark, which long has been the source of the most valuable febrifuge or antipyretic medicine, quinine (q.v.), that has ever been discovered. The earliest well-authenticated instance of the medical use of cinchona bark is found in the year 1638, when the countess of Chinchon (hence the name), the wife of the governor of Peru, was cured of an attack of fever by its administration. The medicine was recommended in her case by the corregidor of Loxa, who was said himself to have practically experienced its supreme virtues eight years earlier. A knowledge of the bark was disseminated throughout Europe by members of the Jesuit brotherhood, whence it also became generally known as Jesuits' bark. According to another account, this name arose from its value having been first discovered to a Jesuit missionary who, when prostrate with fever, was cured by the administration of the bark by a South American Indian. In each of the above instances the fever was no doubt malaria.

The original source of the bark is in the dense forests of New Granada, Ecuador, Peru and Bolivia is a work of great toil and hardship to the Indian cascarilleros or cascadores engaged in the pursuit. The trees grow isolated or in small clumps, which have to be searched out by the experienced cascarrillero, who laboriously cuts his way through the dense forest to the spot where he discovers...
a tree. Having freed the stem from adhering parasites and twining plants, he proceeds, by beating and cutting oblong pieces, to obtain this bark in a state as refined as possible. The bark is then dried, and the entire bark of stem and branches secured. The bark of the smaller branches, as it dries, curl up, forming "quills," the thicker masses from the stems constituting the "flat" bark of commerce. The drying, packing, and transport of the bark are all operations of a laborious description conducted under most disadvantageous conditions.

The enormous medicinal consumption of these barks, and the wasteful and reckless manner of procuring them in America long ago, caused serious and well-grounded apprehension that the native forests would quickly become exhausted. The attention of European communities was early directed to the necessity of securing steady and permanent supplies by introducing the more valuable species into localities likely to be favourable to their cultivation. The first attempt to rear plants was made in Algeria in 1849; but the effort was not successful. In 1854 the Dutch government seriously undertook the task of introducing the trees into the island of Java, and an expedition for that purpose was flet out on a substantial scale. Several hundreds of young trees were obtained, of which a small proportion was successfully landed and planted in Java; and as the result of great attention the cultivation of cinchona plantations in that island became highly prosperous and promising.

The desirability of introducing cinchonas into the East Indies was urged in a memorial addressed to the East India Company between 1838 and 1842 by Sir Robert Christison and backed by Dr. Forbes Royle; but no active step was taken till 1852, when, again on the motion of Dr. Royle, some efforts to obtain plants were made through consul agents. In the end the question was seriously taken up, and Sir Clements R. Markham was appointed to head an expedition to obtain young trees from South America and convey them to India. The transference of the plants was attended with considerable difficulty, but in 1862 under his superintendence a consignment of plants was planted in a favourable situation in the Nilgiri Hills. For several years subsequently additional supplies of plants of various species were obtained from different regions of South America, and some were also procured from the Dutch plantations in Java. Now the culture has spread over a wide area in southern India, in Ceylon, on the slopes of the Himalayas, and in British Burma, and has become widely spread through the tropics generally. The species grown are principally Cinchona officinalis, C. Calisaya, C. succirbura, C. pteryxenicus, and C. Pahudiana, some agreeing with certain soils and climates better than others, while the yield of alkaloids and the relative proportions of the different alkaloids differ in each species.

The official "bark" of the British Pharmacopoeia is that of Cinchona succirbura or red bark. It is imported in the form of quills or recurved pieces, with a rough brown outer surface and a deep red inner surface, forming a reddish brown colourless powder, which has a bitter, astringent taste. The British Pharmacopoeia directs that the bark, when not otherwise stated, is to be prepared and fixed with 5% of alcohol; it contains not less than 5 nor more than 6% of total alkaloids, of which at least one-half is to be constituted by quinine and cinchonidine. The preparations of this bark are four: a liquid extract, standardized to contain 5% of total alkaloids; an acid infusion; a tincture standardized to contain 1% of total alkaloids; and a compound tincture which must possess one-half the alkaloidal strength of the last. The only purpose for which these preparations of cinchona bark should be used is as tonics; and even when this is the desired action there are many reasons why the alkaloid should be preferred, even though the recent introduction of standardized removes one of the chief objections to their use.

The pharmacology of red bark, dependent, as it is almost entirely upon the contained quinine, will not here be discussed (see Quinine).

But in the preparation of cinchona bark is a matter of importance and interest. The bark contains, in the first place, five alkaloids, of which all but quinine may here be dealt with. Quinidine, C₇H₈N₂O₂, is isomeric with quinine, from which it differs in crystallizing in prisms instead of needles, in being dextro- and not laevorotatory, and in being insoluble in ammonia except in much excess. Cinchonine has the formula C₁₉H₁₉N₂O₅, quinine methoxy cinchonine, i.e. C₁₉H₂₄O₂N₄. It occurs in inodorous, bitter, colourless prisms; unlike the two alkaloids already named, does not occur in the bark of Cinchona succirbura; is dextro-rotatory; not fluorescent and practically insoluble in ammonia and in ether. A fourth alkaloid, cinchonidine, is isomeric with cinchonine, which yields it when boiled with amyl alcohol (20% and 20%) to a yellowish brown tarry substance slightly soluble in ammonia. When red bark is extracted with dilute hydrochloric acid, the product filtered, and excess of sodium hydrate added thereto, quinidine and quinine are precipitated: on concentrating the liquor, the dextro-rotatory Cinchona bark yield a white precipitate of an impure alkaloid, called quailline. In addition to the above, red bark contains quinic acid, C₇H₈O₄, which is closely allied to benzoic acid and is excreted in the urine as hippuric acid.

The bark also contains quinic acid, derived from quinoline, which occurs as such in the bark. Besides the trace of volatile oil which gives the bark its characteristic colour, and cinchona red (the bark pigment), there occurs about 2% of cinchonine. Cinchonine is a still more marked feature of cinchonidine and cinchonamine. Even small doses administered to epileptics increase the number of their attacks. They will probably be classified later among the central nervous system poisons. The procaine alkaloids, like the preceding preparations, now that definite active principles can be readily obtained and precisely studied, is almost entirely to be deprecated. Quinidine is almost as powerful as an antidote to malaria as quinine; cinchonine has about twice the power of quinine and cinchonine less than one-half.

CINCINNATI, a city and the county seat of Hamilton County, Ohio, U.S.A., on the Ohio river, opposite the mouth of the Licking, about 100 m. S.W. of Columbus, about 305 m. by rail S.E. of Chicago, and about 760 m. (by rail) W.S.W. of New York. Through the city flows Mill Creek, which empties into the Ohio, Pop. (1890) 296,908; (1900) 325,002, of whom 197,868 were of foreign parentage (i.e. either their fathers or mothers or both were foreign-born), 57,901 were foreign-born, and 14,482 were negroes; (1910) 363,591. The German is by far the most important of the foreign elements. In addition to the large number of inhabitants of German descent, there were, in 1900, 197,152 of German parentage, and of the foreign-born 38,219 came from Germany.

Cincinnati is situated on the N. side of the river upon two terraces or plateaus—the first about 60 ft., the second from 100 to 120 ft., above low water, and upon hills which enclose these terraces on three sides in the form of a theatre, rising to a height of about 400 ft. on the E. and about 460 ft. on the W., and commanding magnificent views of the river, the valley, the numerous suburbs, and the more distant wooded hills. About half of the hill-enclosed plain lies S. of the river, and it is upon this southern half that Covington, Newport, Dayton, Ludlow and other Kentucky suburbs of Cincinnati are situated. Cincinnati has a river-frontage of about 14 m., extends back about 6 m. on the W. side in the valley of Mill Creek, and occupies a total area of about 44 sq. m. Since 1867 it has been connected with Covington by a double suspension bridge designed by John A. Roebling, and rebuilt and enlarged in 1897. This bridge is 1057 ft. long between towers (or, including the approaches, 2252 ft. long), with a height of 101 ft. above low water, and has a double wagon road and two ways for pedestrians. By two bridges there is direct communication with Newport; by one, through the Cincinnati Southern railway, with Ludlow; and by one (Chesapeake & Ohio; see vol. v., p. 109)
with West Covington. On the terraces the streets generally intersect at right angles, but on the hills their directions are irregular. To the "bottoms" (which have suffered much from floods) between Third Street and the river the manufacturing and wholesale districts are for the most part confined, although many of these interests are now on the higher levels or in the suburbs; the principal retail houses are on the higher levels N. of Third Street, and the handsomest residences are on the picturesque hills before mentioned, in those parts of the city, formerly separate villages, known as Avondale, Mt. Auburn, Clifton, Price Hill, Walnut Hills and Mt. Lookout. The main part of the city is connected with these residential districts by electric street railways, whose routes include four inclined-plane railways, namely, Mt. Adams (268 ft. elevation), Bellevue (300 ft.), Fairview (210 ft.) and Price Hill (350 ft.), from each of which an excellent panoramic view of the city and suburbs may be obtained. There are various suburbs, chiefly residential, in the Mill Creek valley, among them being Carthage, Hartwell, Wyoming, Lockland and Glendale. Other populous and attractive suburbs N. of the Ohio river are Norwood and College Hill.

Buildings, &C.—Brick, blue limestone, and a greyish buff freestone are the most common building materials, and the city has various buildings of much architectural merit. The chamber of commerce (completed 1886), designed by H. H. Richardson, is one of the finest public buildings in the United States. Its walls are of undressed granite, and it occupies a ground area of 100 by 150 ft. The United States government building (designed by A. B. Mullet, and built of Maine and Missouri granite) is a fine structure in classic style, 360 ft. long and 160 ft. wide, and 43 stores high; its outer walls are faced with sawn freestone. It was erected in 1874-1885 and cost (including the land) $8,250,000. The city hall (332 ft. by 203 ft.), with walls of red granite and brown sandstone, is a massive and handsome building erected at a cost of $1,600,000. The county court house (rebuilt in 1887) is in the Romanesque style, and with the goal attached occupies an entire square. The Cincinnati hospital (completed 1886), comprising eight buildings grouped about a central court and connected by corridors, occupies a square of four acres. A new public hospital for the suburbs was projected in 1907. St. Peter's (Roman Catholic) cathedral (begun 1839, consecrated 1844), Grecian in style, with a graceful stone spire 224 ft. in height and a chime of 13 bells; it has as an altar-piece Murillo's "St Peter Liberated by an Angel." The church of St Francis de Sales (in Walnut Hills), built in 1888, has a bell, cast in Cincinnati, weighing fifteen tons, and said to be the largest swinging bell in the world. Several of the Protestant churches, such as the First Presbyterian (built 1855; steeple, including spire, 285 ft. high), Second Presbyterian (1872), Central Christian (1886), St Paul's Methodist Episcopal (1870), and St Paul's Protestant Episcopal pro-cathedral (1853), are also worthy of mention, and in the residential suburbs there are many fine churches. Cincinnati is the seat of a Roman Catholic archbishopric and a Protestant Episcopal and Roman Catholic bishopric. The Masonic Temple (150 ft. long and 100 ft. wide), in the Byzantine style, is four stories high, and has two towers of 140 ft.; the building was completed in 1866 and has subsequently been remodelled. Among other prominent buildings are the Oddfellows' temple (completed 1894), the public library, the art museum (1886), a Jewish synagogue (in Avondale), and the (Jewish) Plum Street temple (1866), Moorish in architecture. The Soldiers', Sailors' and Pioneers' building (1907) is a beautiful structure, classic in design. The business houses are of stone or brick, and many of them are attractive architecturally; there are a number of modern office buildings from 15 to 20 stories in height. There are also several large hotels and ten theatres (besides halls and auditoriums for concerts and public gatherings), the most notable being Springer musical hall.

One of the most noted pieces of monumental art in the United States is the beautiful Tyler Davidson fountain in Fountain Square (Fifth Street, between Walnut and Vine streets), the business centre of the city, by which (or within one block of which) all car lines run. The fountain was unveiled in 1871 and was presented to the city by Henry Probasco (1820-1902), a wealthy citizen, who named it in honour of his deceased brother-in-law and business partner, Mr Tyler Davidson. The design, by August von Kreling (1810-1876), embraces fifteen bronze figures, all cast at the royal bronze foundry in Munich: the chief being a female figure with outstretched arms, from whose fingers the water falls in a fine spray. This figure reaches a height of 45 ft. above the ground. The city has, besides, monuments to the memory of Presidents Harrison and Garfield (both in Garfield Place, the former an equestrian statue by Louis T. Rebusio, and the latter by Charles H. Niehaus); also, in Spring Grove cemetery, a monument to the memory of the Ohio volunteers who lost their lives in the Civil War. The art museum, in Eden Park, contains paintings by celebrated European and American artists, statuary, engravings, etchings, metal work, wood carving, textile fabrics, pottery, and an excellent collection in American ethnology and archaeology. The Cincinnati Society of Natural History (incorporated 1870) has a large library and a museum containing a valuable palaeontological collection, and bones and implements from the prehistoric cemetery of the mound-builders, at Madisonville, Ohio.

Parks.—In 1808 Cincinnati had parks covering about 540 acres; there are numerous pleasant driveways both within the city limits and in the suburban districts, and several attractive resorts are within easy reach. Eden Park, of 214 acres, on Mount Adams, about 1 m. E. of the business centre and near the river, is noted for its natural beauty, greatly supplemented by the landscape-gardener's skill, and for its commanding views. The ground was originally the property of Nicholas Longworth (1782-1863), a wealthy citizen and well-known horticulturist, who here grew the grapes from which the Catawba wine, introduced by him in 1818, was made. The park contains the art museum belonging to the art academy. Its gateway, Elsinore, is a medieval reproduction; other prominent features are the reservoirs, which resemble natural lakes, and a high water tower, from which there is a delightful view. In Burnet Woods Park, lying to the N.E. of Eden and containing about 165 acres, are the buildings and grounds of the University of Cincinnati, and a lake for boating and skating. The zoological gardens occupy 60 acres and contain a notable collection of animals and birds. Other pleasure resorts are the Lagoon on the Kentucky side (in Ludlow, Ky.), Chester Park, about 6 m. N. of the business centre, and Coney Island, about 10 m. up the river on the Ohio side. Washington (5-6 acres), Lincoln (10 acres), Garfield and Hopkins are small parks in the city. In 1907 an extensive system of new parks, parkways and boulevards was projected. Spring Grove cemetery, about 6 m. N.W. of the Fountain Square, contains 600 acres picturesquely laid out on the park plan. It contains many handsome monuments and private mausoleums, and a Chinese temple and a Japanese pond in the Japanese style.

Water-Supply.—A new and greatly improved water-supply system for the city was virtually completed in 1907. This provides for taking water from the Ohio river at a point on the Kentucky side opposite the village of California, Ohio, and several miles above the discharge of the city sewers; for the carrying of the water by a gravity tunnel under the river to the Ohio side, the water being thence elevated by four great pumping engines, each having a daily capacity of 30,000,000 gallons, to settling basins, being then passed through filters of the American or mechanical type, and flowing thence by a gravity tunnel more than 4 m. long to the main pumping station, on the bank of the river, within the city; and for the pumping of the water thence, a part directly into the distributing pipes and a part to the principal storage reservoir in Eden Park.

Education.—Cincinnati is an important educational centre. The University of Cincinnati, originally endowed by Charles M'Micken (d. 1858) and opened in 1873, occupies a number of

---

1 The most destructive floods have been those of 1832, 1837, 1883, 1884, and 1907; the highest stage of the water before 1904 was 71 ft. 3 in. in 1884, the lowest 1 ft. 11 in. in 1881.
CINCINNATI

handsome buildings erected since 1805 on a campus of 43 acres in Burnet Woods Park, has an astronomical observatory on the highest point of Mt. Lookout, and is the only strictly municipal university in the United States. The institution embraces a college of liberal arts, a college of engineering, a college of law (united in 1807 with the law school of Cincinnati College, then the only surviving department of that college, which was founded as Lancaster Seminary in 1815 and was chartered as Cincinnati College in 1819), a college of medicine (from 1819 to 1896 the Medical College of Ohio; the college occupies the site of the old M'Cicken homestead), a college for teachers, a graduate school, and a technical school (founded in 1886 and transferred to the university in 1901); while closely affiliated with it are the Clinical and Pathological School of Cincinnati and the Ohio College of Dentistry. With the exception of small fees charged for incidental expenses, the university is free to all students who are residents of the city; others pay $75 a year for tuition. It is maintained in part by the city, through public taxation, and in part by the income from endowment funds given by Charles M'Cicken, Matthew Thoms, David Sinton and others.

The government of the university is entrusted mainly to a board of nine directors appointed by the mayor. In 1899 it had 301,380 students; Lane Theological Seminary is situated in Walnut Hills, in the north-eastern part of the city; it was endowed by Ebenezer Lane and the Kemper family; was founded in 1820 for the training of Presbyterian ministers; had for its first president (1832–1852) Lyman Beecher; and in 1834 was the scene of a bitter contest between abolitionists in the faculty and in the students, led by Theodore Dwight Weld, and the board of trustees, who forbade the discussion of slavery in the seminary and so caused about four-fifths of the students to leave, most of them going to Oberlin College. The city has also Saint Francis Xavier College (Roman Catholic, established in 1831 and until 1840 known as the Athenaeum); Saint Joseph College (Roman Catholic, 1873); Mount St Mary's of the West Seminary (Roman Catholic, theological, 1848, at Cedar Point, Ohio); Hebrew Union College (1875), the leading institution in the United States for educating rabbis; the largely attended Ohio Mechanics' Institute (founded 1828), a private corporation not conducted for profit, its objects being the education of men and women, the training of industrial leaders, and the advancement of the mechanical arts (in 1907, there were in all departments 1,421 students, a large majority of whom were in the evening classes); an excellent art academy, modelled after that of South Kensington; the College of Music and the Conservatory of Music (mentioned below); the Miami Medical College (opened in 1852); the Pulte Medical College (homeopathic; coeducational; opened 1872); the Eclectic Medical Institute (chartered 1845); two women's medical colleges, two colleges of dental surgery, a college of pharmacy, and several business colleges. The public, district, and high schools of the city are excellent. The City (or public) library contained in 1906 301,380 vols. and 57,562 pamphlets; the University library (including medical, law and astronomical branches), 80,000 vols. (including the Robert Clarke collection, rich in Americana, and the library—about 5000 vols.—of the American Association for the Advancement of Science); the Young Men's Mercantile Library, 70,000 vols.; and the Free Library, 33,000 vols.; in addition, the Lloyd library and museum of botany and pharmacy, and the library of the Historical and Philosophical Society of Ohio (1831), which contains a valuable collection of rare books, pamphlets and manuscripts, are worthy of mention.

Art, &c.—The large German population makes the city noteworthy for its music. The first Sängermet was held in Cincinnati in 1849, and it met here again in 1870, when a new hall was built for its accommodation. Under the leadership of Theodore Thomas (1835–1905), the Cincinnati Musical Festival Association was incorporated, and the first of its biennial May festivals was held in 1873. In 1875–1878 was built the large Springer music hall, named in honour of Reuben R. Springer (1800–1884), its greatest benefactor, who endowed the Cincinnati College of Music (incorporated in 1878), of which Thomas was director in 1878–1881. Until his death Thomas was director of the May festivals also. The grounds for the music hall were given by the city and are perpetually exempt from taxation. The great organ in the music hall was dedicated at the third of the May festivals in 1878. The Sängerfest met in Cincinnati for the third time in 1879, and its jubilee was held here in 1890. By 1880 the May festival chorus had become a permanent organization. The city has several other musical societies—the Apollo and Orpheus clubs (1881 and 1893), a Liederkranz (1886), and a United Singing Society (1896) being among the more prominent; and there are two schools of music—the Conservatory of Music and the College of Music.

The city has large publishing interests, and various religious (Methodist Episcopal and Roman Catholic) and fraternal periodicals, and several technical journals and trade papers are published here. The principal daily newspapers are the Enquirer, a Democratic journal, established in 1842 and conducted for many years after 1852 by Washington McLean (1816–1890), and then by his son, John Roll McLean (b. 1848); the Commercial Tribune (Republican; previously the Commercial-Gazette and the Commercial, founded in 1793, The Tribune being merged with it in 1866), the Times-Star (the Times established in 1836), and the Post, established in 1881 (both evening papers); and several influential German journals, including the Volksblatt (Republican; established 1836), and the Volksfreund (Democratic; established 1850).

Among the social clubs of the city are the Queen City Club, organized in 1874; the Phoenix Club, organized in 1856 and the leading Jewish club in the city; the Cuvier Club, organized in 1871 and originally an association of hunters and anglers for the preservation of game and fish; the Cincinnati Club, the Business Men's Club, the University Club, the Art Club, and the Literary Club, of the last of which many prominent men, including President Hayes, have been members. This club dates from 1849, and is said to be the oldest literary club in the country. There are various commercial and trade organizations, the oldest and most influential being the Cincinnati Chamber of Commerce and Merchants' Exchange, which dates from 1839.

The city is governed under the municipal code enacted by the state legislature in 1902, for the provisions of which see OHIO.

Among the institutions are the City infirmary (at Hartwell, a suburb), which, besides supporting pauper inmates, affords relief to outdoor poor; the Cincinnati hospital, which is supported by taxation and treats without charge all who are unable to pay; twenty other hospitals, some of which are charitable institutions; a United States marine hospital; the Longview hospital for the insane, at Carthage, 10 m. from the city, and belonging to Hamilton county, whose population consists largely of the inhabitants of Cincinnati; an insane asylum for negroes; six orphan asylums—the Cincinnati, two Protestant, two Roman Catholic, and one for negroes; a home for incurables; a day nursery; a fresh-air home and farm for poor children; the Franciscan Brothers' Protectors for boys; a children's home; two widows' homes; two old men's homes; several homes for indigent and friendless women; a founding asylum; the reformatory mission and home for erring women; a social settlement conducted by the University of Cincinnati; the house of refuge (1850) for "the reformation and education of homeless and incorrigible children under 16 years of age"; and a workhouse for adults convicted of minor offenses.

Communications.—Cincinnati is a railway centre of great importance and has an extensive commerce both by rail and by river. It is served by the following railways: the Pittsburgh, Cincinnati, Chicago & St Louis (Pennsylvania system), the Cleveland, Cincinnati, Chicago & St Louis (New York Central system), the Chicago, Cincinnati & Louisville, the Cincinnati, New Orleans & Texas Pacific (the lessee of the Cincinnati Southern railway, connecting Cincinnati and Chattanooga, Tenn., its line, and cosmopolitan).

1 The Cincinnati Southern railway is of especial interest in that it was built by the city of Cincinnati in its corporate capacity. Much
CINCINNATI

forming part of the so-called Queen & Crescent Route to New Orleans, the Erie, the Baltimore & Ohio South-Western (Baltimore & Ohio system), the Chesapeake & Ohio, the Norfolk & Western, the Louisville & Nashville, the Cincinnati, Hamilton & Dayton, the Cincinnati Northern (New York Central system), the Cincinnati & Muskingum Valley (Pennsylvania system), and the Cincinnati, Lebanon & Northern (Pennsylvania system). Most of these railways use the Union Station; the Pennsylvania and the Cincinnati, Hamilton & Dayton, have separate stations. The city's river commerce, though of less relative importance since the advent of railways, is large and brings to its wharves much bulky freight, such as coal, iron and lumber; it also helps to distribute the products of the city's factories; and the National government has done much to sustain this commerce by deepening and lighting the channel. Formerly there was considerable commerce with Lake Erie by way of the Miami & Erie Canal to Toledo; the canal was completed in 1830 and has never been entirely abandoned.

Industries.—Although the second city in population in the state, Cincinnati ranked first in 1900 as a manufacturing centre, but lost this pre-eminence to Cleveland in 1905, when the value of Cincinnati's factories was $10,679,928, being 17.2% over the figures for 1900. In the manufacture of vehicles, harness, leather, hardwood lumber, wood-working machinery, machine tools, printing ink, soap, pig iron, malt liquors, whisky, shoes, clothing, cigars and tobacco, furniture, cooperage goods, iron and steel safes and vaults, and pianos, also in the packing of meat, especially pork, it ranks very high among the cities of the Union. The well-known and beautiful Rookwood ware has been made in Cincinnati since 1880, at the Rookwood Pottery (on Mt. Adams), founded by Mrs Bellamy (Maria Longworth) Storer, named from her father's home near the city, the first American pottery to devote exclusive attention to art ware. The earlier wares were yellow, brown and red; then came deep greens and blues, followed by mat glazes and by "velvum" ware (first exhibited in 1904), a lustreless pottery, resembling old parchment, with its decoration painted or modelled or both. The clays used are exclusively American, much being obtained in Missouri. Among the more important manufactures of the city in 1905 were the following, with the value of the product for that year: clothing ($16,972,484), slaughtering and meat-packaging products ($3,446,202), foundry and machine-shop products ($11,528,708), boots and shoes ($10,596,028), distilled liquors ($9,600,826), malt liquors ($7,702,603), and carriages and wagons ($6,323,803).

History.—Cincinnati was founded by some of the first settlers in that part of the North-West Territory which afterwards became the state of Ohio. It lies on part of the land purchased for himself and others by John Cleves Symmes (1742–1814) from the United States government in 1788, and the settlement was established near the close of the same year by immigrants chiefly from New Jersey and Kentucky. When the town was laid out early in 1789, John Filson, one of the founders, named it Lonsait, the name by which the city's trade had always been with the Southern states, and the urgent need of better facilities for this trade than the river and existing canals afforded led to the building of the town, and the city. The work was carried on under the direction of a board of five trustees appointed by the superior court of Cincinnati in accordance with the so-called Ferguson Act passed by the Ohio legislature in 1789, and the railway was completed to Chattanooga in February 1880. For accounts of the building and the management of the railway, see J. H. Hollandcr, The Cincinnati Southern Railway; a Study in Municipal Activity (Baltimore, 1884), one of the Johns Hopkins Lectures on Political Science; and The Founding of the Cincinnati Southern Railway, with an Autobiographical Sketch by E. A. Ferguson (Cincinnati, 1895).

Before 1863 Cincinnati was the principal centre in the United States for the slaughtering of hogs and the packing of pork. The industry began as early as 1820 and rapidly increased in importance, but after 1863 Chicago took the lead.

These figures are from the U.S. census, and are of course for Cincinnati proper: some of the largest industrial establishments, however, are just outside the city limits—among these are manufactories of soap (the Ivory Soap Works), machine tools, electrical machinery and appliances, structural and architectural iron work, and office furnishings.

ville (L for Licking; or, Latin for mouth; anit, Greek for opposite; and ville, French for town), but early in the next year Symmes caused the present name to be substituted in honour of the Order of the Cincinnati, General Arthur St Clair, the governor of the North-West Territory, being then president of the Pennsylvania State Society of the Cincinnati. St Clair arrived about the time the change in name was made, immediately erected Hamilton County, and made Cincinnati its seat of government; the territorial legislature also held its session here from the time of its first organization in 1799 until 1801, when it removed to Chillicothe. During the early years the Indians threatened the life of the settlement, and in 1789 Fort Washington, a log building for protection against the Indians, was built in the city; General Josiah Harmar, in 1790, and General St Clair, in 1791, made unsuccessful expeditions against them, and the alarm increased until 1794, when General Wayne won a decisive victory over the savages at Maumee Rapids in the battle of Fallen Timbers, after which he secured their consent to the terms of the treaty of Greenville (1795). Cincinnati was incorporated as a village in 1802, received a second charter in 1815, was chartered as a city in 1819, and received its second city charter in 1829 and its third in 1851. Since 1851 the great city has been governed nominally by general laws of the state, although by the state, identifying cities many acts for its government have been in reality special. When first incorporated its limits were confined to an area of 3 sq. m., but by annexations in 1849 and 1850 this area was doubled; in 1854 another square mile was added; in 1869 and 1870 large additions were made, which included the villages of Sedamsville, Price Hill, Walnut Hills, Mount Auburn, Cliftonville, Corryville, Vernon, Mount Harrison, Barstville, Fairmount, West Fairmount, St Peters, Lick Run and Clifton Heights; in 1872 Columbia, which was settled a short time before Cincinnati, was added; in 1873 Cumminsville and Woodburn; in 1895 Avondale, Riverside, Clifton, Linwood and Westwood; in 1903 Bond Hill, Winton Place, Hyde Park and Evanston; in 1904 portions of Mill Creek township, and in 1905 a small tract in Mill Creek Valley.

In 1829 Mrs Frances Trollope established in Cincinnati, where she lived for a part of two years, a "Bazar," which as the principal means of carrying out her plan to benefit the town was entirely unsuccessful; a vivid but scarcely unbiased picture of Cincinnati in the early thirties is to be found in her Domestic Manners of the Americans (1831). In 1845 began the marked influx of Germans, which lasted in large degree up to 1860; they first limited themselves to the district "Over the Rhine" (the Rhine being the Miami & Erie Canal), in the angle north-east of the junction of Canal and Sycamore streets, but gradually spread throughout the city, although this "Over the Rhine" is still most typically German.

For more than ten years preceding the Civil War the city was much disturbed by slavery diession—the industrial interests were largely with the South, but abolitionists were numerous and active, and the city was an important station on the "Underground Railroad," of which Dr Norton S. Townsend (1815–95) was conductor, and one of the stations was the home of Mrs. Harriet Beecher Stowe, who lived in Cincinnati from 1832 to 1850, and gathered there much material for her novel Uncle Tom's Cabin. In 1834 came the Lane Seminary controversies over slavery previously referred to. In 1835 James G. Birney established here his anti-slavery journal, The Philanthropist, but his printing shops were repeatedly mobbed and his presses destroyed, and in January of 1836 his bold speech before a mob gathered at the court-house was the only thing that saved him from personal violence, as the city authorities had warned him that they had not sufficient force to protect him.

At the time of the Civil War the city was strongly in sympathy with the North. In September 1862 the city was threatened by a Confederate force under General Kirby Smith, who led the advance of General Bragg's army (see American Civil War). On the 28th of March 1864 many of the citizens met at Music Hall to protest against the lax way in which the law was enforced, notably in the case of a recent murder, when the confessed
criminal had been found guilty of manslaughter only. An attempt was made on the gaol by the lawless element outside the hall, but it was futile, the murderer having been removed by the authorities to Columbus. In its efforts to break into the gaol and court-house the mob was confronted by the militia, and bloodshed and loss of life resulted; during the rioting the court-house was fired by the mob and practically destroyed, and many valuable records were burned. Various important political conventions have met in Cincinnati, including the national Democratic convention of 1856, the national Liberal-Republican convention of 1872, the national Republican convention of 1876, and the national Democratic convention of 1880—by which, respectively, James Buchanan, Horace Greeley, R. B. Hayes and Winfield Scott Hancock were nominated for the presidency. See C. T. Greve, Centennial History of Cincinnati and Representative Citizens (Chicago, 1904), the official municipal documents, the Annual Reports of the Cincinnati Chamber of Commerce, &c.

CINERELLA (i.e. little cinder girl), the heroine of an almost universal fairy-tale. Its essential features are: (1) the persecuted maiden whose youth and beauty bring upon her the jealousy of her step-mother and sisters, (2) the intervention of a fairy or other supernatural instrument on her behalf, (3) the prince who falls in love with and marries her. In the English version, a translation of Perrault's Contrella, the glass slipper which she drops on the palace stairs is due to a mistranslation of pantoufle en vair (a fur slipper), mistaken for en verre. It has been suggested that the story originated in a nature-myth, Cindrella being the dawn, oppressed by the night-clouds (cruel relatives) and finally rescued by the sun (prince).

See Marian Rolfe Cox. Cinderella; Three Hundred and Forty-five Variants (1893); A Lang, Perrault's Popular Tales (1888).

CINEMA, a Thessalian, the chief adviser of Pyrrhus, king of Epirus. He studied oratory in Athens, and was regarded as the most eloquent man of his age. He tried to dissuade Pyrrhus from engaging in the war, and after the defeat of the Romans at Heraclea (280 B.C.) was sent to Rome to discuss terms of peace. These terms, which are said by Appian (De Rebus Sanniticis, x, 11) to have included the freedom of the Greeks in Italy and the restoration to the Bruttians, Apulians and Samnites of all that had been taken from them, were rejected chiefly through the vehement and patriotic speech of the aged Appius Claudius Cæcus the censor. The withdrawal of Pyrrhus from Italy was demanded, and Cineas returned to his master with the report that Rome was a temple and its senate an assembly of kings. Two years later Cineas was sent to renew negotiations with Rome on easier terms. The result was a cessation of hostilities, and Cineas crossed over to Sicily, to prepare the ground for Pyrrhus's campaign. Nothing more is heard of him. He is said to have made an epitome of the Tactica of Aeneas, probably referred to by Cicero, who speaks of Cineas as the author of a treatise De Re Militari.

See Plutarch, Pyrrhus, 11-21; Justin xvii. 2; Eutropius ii. 12; Cicero, Ad Fam. ix. 25.

CINEMATOGRAPH, or KINEMATOGRAPH (from σήμα, motion, and γραφεῖν, to depict), an apparatus in which a series of views representing closely successive phases of a moving object are exhibited in rapid sequence, giving a picture which, owing to persistence of vision, appears to the observer to be in continuous motion. It is a development of the zoetrope or "wheel of life," described by W. G. Horner about 1833, which consists of a hollow cylinder turning on a vertical axis and having its surface pierced with a number of slots. Round the interior is arranged a series of pictures representing successive stages of such a subject as a galloping horse, and when the cylinder is rotated an observer looking through one of the slots sees the horse apparently in motion. The pictures were at first drawn by hand, but photography was afterwards applied to their production. E. Muybridge about 1877 obtained successive pictures of a running horse by employing a row of cameras, the shutters of which were opened and closed electrically by the passage of the horse in front of them, and in 1885 E. J. Marey of Paris established a studio for investigating the motion of animals by similar photographic methods.

The modern cinemograph was rendered possible by the invention of the celluloid roll film (employed by Marey in 1890), on which the serial pictures are impressed by instantaneous photography, a long sensitized film being moved across the focal plane of a camera and exposed intermittently. In one apparatus for making the exposures a cam jerks the film across the field once for each picture, the slack being gathered in on a drum at a constant rate. In another four lenses are rotated so as to give four images for each rotation, the film travelling so as to present a new portion in the field as each lens comes in place. Sixteen to fifty pictures may be taken per second. The films are developed on large drums, within which a ruby electric light may be fixed to enable the process to be watched. A positive is made from the negative thus obtained, and is passed through an optical lantern, the images being thus successively projected through an objective lens upon a distant screen. For a six-hour's exhibition 50,000 to 165,000 pictures are needed. To regulate the feed in the lantern a bolt is punched in the film for each picture. These holes must be extremely accurate in position; when they wear the feed becomes irregular, and the picture dances or vibrates in an unpleasant manner. Another method of exhibiting cinematographic effects is to bind the pictures together in book form by one edge, and then release them from the other in rapid succession by means of the thumb or some mechanical device as the book is bent backwards. In this case the subject is viewed, not by projection, but directly, either with the unaided eye or through a magnifying glass.

Cinematograph films produced by ordinary photographic processes, being in black and white only, fail to reproduce the colouring of the subjects they represent. To some extent this defect has been remedied by painting them by hand, but this method is too expensive for general adoption, and moreover does not yield very satisfactory results. Attempts to adapt colour photography by using simultaneously three films, each with a source of light of appropriate colour, and combining the three images on the screen, have to overcome great difficulties in regard to maintenance of register, because very minute errors of adjustment between the pictures on the films are magnified to an intolerable extent by projection. In a process devised by G. A. Smith, the results of which were exhibited at the Society of Arts, London, in December 1908, the number of colour records was reduced to two. The films were specially treated to increase their sensitiveness to red. The photographs were taken through two colour filters alternately interposed in front of the film; both admitted white and yellow, but one, of red, was in addition specially concerned with the orange and red of the subject, and the other, of blue-green, with the green, blue-green, blue and violet. The camera was arranged to take not less than 16 pictures a second through each filter, or 48 a second in all. The positive transparency made from the negative thus obtained

1 I.e. the "curly-haired."
CINERARIA—CINNA

was used in a lantern so arranged that beams of red (composed of crimson and yellow) and of green (composed of yellow and blue) issued from the lens alternately, the mechanism presenting the pictures made with the red filter to the red beam, and those made with the green filter to the green beam. A supplementary shutter was provided to introduce violet and blue, to compensate for the deficiency in those colours caused by the necessity of cutting them out in the camera owing to the over-sensitivity of the film to them, and the result was that the successive pictures, blending on the screen by persistence of vision, gave a reproduction of the scene photographed in colours which were sensibly the same as those of the original.

The cinematograph enables "living" or "animated pictures" of such subjects as an army on the march, or an express train at full speed, to be presented with marvellous distinctness and completeness of detail. Machines of this kind have been devised in enormous numbers and used for purposes of amusement under names (bioscope, biograph, kinetoscope, mutograph, &c.) formed chiefly from combinations of Greek and Latin words for life, movement, change, &c., with suffixes taken from such words as σκόπεω, to see, γράφω, to depict; they have also been combined with phonographic apparatus, so that, for example, the music of a dance and the motions of the dancers are simultaneously reproduced to ear and eye. But when they are used for purposes of entertainment, owing to the extreme inflammability of the celluloid film and its employment in close proximity to a powerful source of light and heat, such as is required if the pictures are to show brightly on the screen, precautions must be taken to prevent, as far as possible, the heat rays from reaching it, and effective means must be provided to extinguish it should it take fire. The production of films composed of non-inflammable material has also engaged the attention of inventors.

See H. V. Hopwood, Living Pictures (London, 1899), containing a bibliography and a digest of the British patents, which is supplemented in the Optician, vol. xviii. p. 85; Eugène Trutat, Le Photographie animée (1899), which contains a list of the French patents.

For the camera see also Photography: Apparatus.

CINERARIA. The garden plants of this name have originated from a species of Senecio, S. cruentus (nat. ord. Compositae), a native of the Canary Isles, introduced to the royal gardens at Kew by T. Suduiraut. It was known originally as Cineraria cruenta, but the genus Cineraria is now restricted to a group of South African species, and the Canary Island species has been transferred to the large and widespread genus Senecio. Cinerarias can be raised freely from seeds. For spring flowering in England the seeds are sown in April or May in well-drained pots or pans, in soil of three parts loam to two parts leaf-mould, with one-sixth sand; cover the seed thinly with fine soil, and press the surface firm. When the seedlings are large enough to handle, prick them out in pans or pots of similar soil, and when more advanced pot them singly in 4-in. pots, using soil a trifle less sandy. They should be grown in shallow frames facing the north, and, if so situated that the sun shines upon the plants in the middle of the day, they must be slightly shaded; give plenty of air, and never allow them to get dry. When well established with roots, shift them into 6-in. pots, which should be liberally supplied with manure water as they get filled with roots. In winter remove to a pit or house, where a little heat can be supplied whenever there is a risk of their getting frozen. They should stand on a moist bottom, but must not be subjected to cold draughts. When necessary, pour ashes over them every alternate watering. Seeds sown in March, and grown on in this way, will be in bloom by Christmas if kept in a temperature of from 40° to 45° at night, with a little more warmth in the day; and those sown in April and May will succeed them during the early spring months, the latter set of plants being subjected to a temperature of 38° or 40° during the night. If grown much warmer than this, the Cineraria maggot will make its appearance in the leaves, tunnelling its way between the upper and lower surfaces and making whitish irregular markings all over. Such affected leaves must be picked off and burned. Green fly is a great pest on young plants, and can only be kept down by fumigating or vaporizing the houses, and syringing with a solution of quassia chips, soft soap and tobacco.

CINGOLI (anc. Cingulum), a town of the Marches, Italy, in the province of Macerata, about 14 m. N.W. direct, and 17 m. by road, from the town of Macerata. Pio 1000; p. 3,357. The Gothic church of S. Esperanzio contains interesting works of art. The town occupies the site of the ancient Cingulum, a town of Picenum, founded and strongly fortified by Caesar's lieutenant T. Labienus (probably on the site of an earlier village) in 63 B.C. at his own expense. Its lofty position (2,500 ft.) made it of some importance in the civil wars, but otherwise little is heard of it. Under the empire it was a municipium.

CINNA, a Roman patrician family of the gens Cornel. The most prominent member was LUCIUS CORNELIUS CINNA, a supporter of Marius in his contest with Sulla. After serving in the war with the Marsi as praetorian legate, he was elected consul in 87 B.C. Breaking the oath he had sworn to Sulla that he would not attempt any revolution in the state, CINNA allied himself with Marius, raised an army of Italians, and took possession of the city. Soon after his triumphant entry and the massacre of the friends of Sulla, by which he had satisfied his vengeance, Marius died. L. Valerius Flaccus became CINNA's colleague, and on the murder of Flaccus, Cn. Papirius Carbo. In 84, however, CINNA, who was still consul, was forced to advance to Sulla; but, on his sending his troops to meet him in Tressay, he was killed in a mutiny. His daughter Cornelia was the wife of Julius Caesar, the dictator; but his son, L. CORNELIUS CINNA, praetor in 44 B.C., nevertheless sided with the murderers of Caesar and publicly extolled their action.

The hero of CORNELIUS's tragedy CINNA (1640) was Cn. Cornelius Cinna, surnamed Magnus (after his maternal grandfather Pompey), who was magnanimously pardoned by Augustus for conspiring against him.

CINNA, GAIUS HELVIIUS, Roman poet of the later Ciceronian age. Practically nothing is known of his life except that he was the friend of CATULLUS, whom he accompanied to Bithynia in the suite of the praetor Memmius. The circumstances of his death have given rise to some discussion. Suetonius, Valerius Maximus, Appian and Dio CASSIUS all state that, at Caesar's funeral, a certain Helvius Cinna was killed by mistake for Cornelius Cinna, the conspirator. The last three writers mentioned above add that he was a tribune of the people, while Plutarch, referring to the affair, gives the further information that the Cinna who was killed by the mob was a poet. This points to the identity of Helvius Cinna with Helvius Cinna the poet. The chief objection to this view is based upon two lines in the 9th elogium of Virgil, supposed to have been written 41 to 40 B.C. Here reference is made to a certain Cinna, a poet of such importance that Virgil deprecates comparison with him; it is argued that the manner in which this Cinna, who could hardly have been any one but Helvius Cinna, is spoken of implies that he was then alive; if so, he could not have been killed in 44. But such an interpretation of the Virgilian passage is by no means absolutely necessary; the terms used do not preclude a reference to a contemporary no longer alive. It has been suggested that it was really Cornelius, not Helvius Cinna, who was slain at Caesar's funeral, but this is borne out by the authorities. Cinna's chief work was a mythological epic poem called Smyrna, the subject of which was the incestuous love of Smyrna (or Myrrha) for her father Cinyras, treated after the manner of the Alexandrian poets. It is said to have taken nine years to finish. A Propompaicon Pollonis, a send-off to [Asinus] Pollio, is also attributed to him. In both these poems, the language of which was so obscure that they required special commentaries, his model appears to have been Parthenius of Nicaea.

See A. Weichert, Poetarum Latinarum Vitae (1830); L. Müller's edition of Catullus (1870), where the remains of Cinna's poems are printed; A. Kiesling, De C. Helviiin Cinna Poeta in Commentationes Philologice in honore T. Mommsen (1878); O. Ribecke, Geschichte der romischen Dichtung, i. (1887); Tschud-Schwebe, Hist. of Roman Lit. (Eng. tr. 213, 2-5); Plessis, Poésie latine (1909).
CINNABAR—CINNAMUS

CINNABAR (Ger. Zinnaher), sometimes written cinnabarite, a name applied to red mercuric sulphide (HgS), or native vermilion, the common ore of mercury. The name comes from the Greek κυμαβρα, used by Theophrastus, and probably applied to several distinct substances. Cinnabar is generally found in a massive, granular or earthy form, of bright red colour, but it occasionally occurs in crystals, with a metallic adamantine lustre. The crystals belong to the hexagonal system, and are generally of rhombohedral habit, sometimes twinned. Cinnabar presents remarkable resemblance to quartz in its symmetry and optical characters. Like quartz it exhibits circular polarization, and A. Des Cloizeaux showed that it possessed fifteen times the rotatory power of quartz (see Polarization of Light). Cinnabar has higher refractive power than any other known mineral, its mean index for sodium light being 3-02, whilst the index for diamond—a substance of remarkable refraction—is only 2-42 (see Refraction). The hardness of cinnabar is 3, and its specific gravity 8-908.

Cinnabar is found in all localities which yield quicksilver, notably Almaden (Spain), New Almaden (California), Idria (Austria), Landsberg, near Ober-Moschel in the Palatinate, Riga, at the foot of the Apuan Alps (Tuscany), the mountain Avala (Servia), Huancavelica (Peru), and the province of Kweichow in China, whence very fine crystals have been obtained. Cinnabar is in course of deposition at the present day from the hot waters of Sulphur Bank, in California, and Steamboat Springs, Nevada.

Hepatic cinnabar is an impure variety from Idria in Carniola, in which the cinnabar is mixed with bituminous and earthy matter.

Metacinnabarite is a cubic form of mercuric sulphide, this compound being dimorphous.

For a general description of cinnabar, see G. F. Becker’s Geology of the Quicksilver Depots of the Pacific Slope, U.S. Geol. Surv. Monographs, No. xiii. (1888.)

CINNAMIC ACID, or Phenylacrylic Acid, C6H5CH·:CH·:COOH, an acid found in the form of its benzyl ester in Peru and Tolu balsams, in storax and in some gum-benzoin.

It can be prepared by the reduction of phenyl propionic acid with zinc and acetic acid, by heating benzoic malonic acid, by the condensation of ethyl acetate with benzaldehyde in the presence of sodium ethylate or by the so-called “Perkin reaction”; the latter being the method commonly employed. In making the acid by this process benzaldehyde, acetic anhydride and anhydrous sodium acetate are heated for some hours to about 180° C., the resulting product is made alkaline with sodium carbonate, and any excess of benzaldehyde removed by a current of steam. The residual liquor is filtered and acidified with hydrochloric acid, when cinnamic acid is precipitated, C6H5CHO+CH3COONa = C6H5CH·:CH·:COONa+H2O. It may be purified by recrystallization from hot water. Considering the controversy that has taken place as to the course pursued by this reaction, but the matter has been definitely settled by the work of R. Fittig and his pupils (Annalen, 1883, 216, pp. 100, 115; 1885, 227, pp. 55, 110), in which it was shown that the aldehyde forms an addition compound with the sodium salt of the fatty acid, and that the acetic anhydride plays the part of a dehydrating agent. Cinnamic acid crystallizes in needles or prisms, melting at 135° C.; on reduction it gives phenyl propionic acid, C6H5CH·:CH·:COOH. Nitric acid oxidizes it to benzoinic acid and acetic acid. Potash fusion decomposes it into benzoinic and acetic acids. Being an unsaturated acid it combines directly with hydrochloric acid, hydrobromic acid, bromine, &c. On nitration it gives a mixture of ortho and para nitrocinnamic acids, the former of which is of historical importance, as by converting it into orthoquinonphenyl propionic acid A. Baeyer was enabled to carry out the complete synthesis of indigo (p. 441). Reduction of orthoquinonphenylcinnamic acid gives orthohydroquinoncinnamic acid, C6H5(NH2)CH·:CH·:COOH, which is of theoretical importance, as it readily gives a quinoline derivative. An isomer of cinnamic acid known as allo-cinnamic acid is also known.

For the oxy-cinnamic acids see Coumarin.

CINNAMON, the inner bark of Cinnamomum zeylanicum, a small evergreen tree belonging to the natural order Lataceae, native to Ceylon. The leaves are large, ovate-oblanceolate, and the flowers, which are arranged in panicles, have a greenish colour and a rather disagreeable odour. Cinnamon has been known from remote antiquity, and it was so highly prized among ancient nations that it was regarded as a present fit for monarchs and other great potentates. It is mentioned in Exod. xxx. 23, where Moses is commanded to use both sweet cinnamon (Kinnamon) and cassia, and it is alluded to by Herodotus under the name κυμαβρα, and by other classical writers. The tree is grown at Tellicherry, in Java, the West Indies, Brazil and Egypt, but the produce of none of these places approaches in quality that grown in Ceylon. Ceylon cinnamon of fine quality is a very thin smooth bark, with a light-yellowish brown colour, a highly fragrant odour, and a peculiarly sweet, warm and pleasing aromatic taste. Its flavour is due to an aromatic oil which it contains to the extent of from 0-5 to 1%. This essential oil, as an article of commerce, is prepared by roughly pounding the bark, macerating it in sea-water, and then quickly distilling the whole. It is of a golden-yellow colour, with the peculiar odour of cinnamon and a very hot aromatic taste. It consists essentially of cinnamic aldehyde, and by the absorption of oxygen as it becomes old it darkens in colour and develops resinous compounds. Cinnamon is principally employed in cookery as a condiment and flavouring material, being largely used in the preparation of some kinds of chocolate and liqueurs. In medicine it acts like other volatile oils and has a reputation as a cure for colds. Being a much more costly spice than cassia, that comparatively harsh-flavoured substance is frequently substituted for or added to it. The two barks when whole are easily enough distinguished, and their microscopical characters are also quite distinct. When powdered bark is treated with tincture of iodine, little effect is visible in the case of pure cinnamon of good quality, whereas when cassia is present a deep-blue tint is produced, the intensity of the coloration depending on the proportion of the cassia.

CINNAMON-STONE, a variety of garnet, belonging to the lime-alumina type, known also as essonite or hessonite, from the Gr. ἔσσων, “inferior,” in allusion to its being less hard and less dense than most other garnets. It has a characteristic red colour, inclining to orange, much like that of hyacinth or jacinth. Indeed it was shown many years ago, by Sir A. H. Church, that many gems, especially engraved stones, commonly regarded as hyacinth, were really cinnamon-stone. The difference is readily detected by the specific gravity, that of hessonite being 3-64 to 3-69, whilst that of hyacinth (zircon) is about 4-6. Hessonite is rather a soft stone, its hardness being about that of quartz or 7, whilst the hardness of most garnets reaches 7-5. Cinnamon-stone comes chiefly from Ceylon, where it is found generally as pebbles, though its occurrence in its native matrix is not unknown.

CINNAMUS [KINNAMOS], JOHN, Byzantine historian, flourished in the second half of the 12th century. He was imperial secretary (probably in this case a post connected with the military administration) to Manuel I. Comnenus (1143-1180), whom he accompanied on his campaigns in Europe and Asia Minor. He appears to have outlived Andronicus I., who died in 1185. Cinnamus was the author of a history of the period 1118-1176, which thus continues the Alexiad of Anna Comnena, and embraces the reigns of John II. and Manuel I., down to the unsuccessful campaign of the latter against the Turks, which ended with the disastrous battle of Myriokephalon and the rout of the Byzantine army. Cinnamus was probably an eye-witness of the events of the last ten years which he describes. The work breaks off abruptly; originally it no doubt went down to the death of Manuel, and there are indications that, even in its present form, it is an abridgment. The text is in a very corrupt state. The author’s hero is Manuel; he is strongly impressed with the superiority of the East to the West, and is a determined opponent of the pretensions of the papacy. But he cannot be reproached with undue bias; he writes with the
straightforwardness of a soldier, and is not ashamed on occasion to confess his ignorance. The matter is well armed, the style (modelled on that of Xenophon) simple, and on the whole free from the usual florid bombast of the Byzantine writers.

Edito princeps, C. Toliussi (1662); in Bonn, Corpus Scriptorum Historicorum byzantinorum, by A. Meineke (1836), with Du Cange's valuable notes; Migne, Patrologia Graeca, cxcxxiii; see also C. Neumann, Griechische Geschichtsschreiber im 12. Jahrhundert (1888); H. von Kap-Herr, Die abendländischen Politik-Kaiser-Manuscripte (1881); C. Krambacher, Geschichte des byzantinischen Literaturreiter (1897).

CINNOLIN, \( \text{C}_9\text{H}_7\text{N}_2 \), a compound isomeric with phthalazine, prepared by boiling dihydrocinnolin dissolved in benzene with freshly precipitated mercuric oxide. The solution is filtered and the hydrochloride of the base precipitated by alcoholic hydrochloric acid; the free base is obtained as an oil by adding caustic soda. It may be obtained in white silky needles, melting at 24.3-25.5°C and containing a molecule of ether of crystallization by cooling the oil dissolved in ether. The free base melts at 39°C. It is a strong base, forming stable salts with mineral acids, and is easily soluble in water and in the ordinary organic solvents. It has a taste resembling that of chloral hydrate, and leaves a sharp irritation for some time on the tongue; it is also very poisonous (M. Busch and A. Rast, Berichte, 1897, 30, p. 521). Cinnolin derivatives are obtained from oxyccinnolin carboxylic acid, which is formed by digesting orthophenylpropionic acid diazo chloride with water. Oxyccinnolin carboxylic acid on heating gives oxyccinnolin, melting at 293°, which with phosphorus pentachloride gives chlorccinnolin. This substance is reduced by iron filings and sulphuric acid to dihydrocinnolin.

The relations of these compounds are here shown:

\[
\begin{align*}
\text{Oxyccinnolin} & \rightarrow \text{Dihydrocinnolin} \\
\text{Oxyccinnolin} & \rightarrow \text{Oxyccinnolin} \\
\text{Oxyccinnolin} & \rightarrow \text{Dihydrocinnolin}
\end{align*}
\]

CINO DA PISTOIA (1270-1336), Italian poet and jurist, whose full name was GIUTTURINO CINO DE' SIMBALDI, was born in Pistoia, of a noble family. He studied law at Bologna under Dinus Muggelansus (Dino de Rossoni; d. 1309) and Francisccus Accursius, and in 1307 is understood to have been assessor of civil causes in his native city. In that year, however, Pistoia was disturbed by the Guelph and Ghibelline feud. The Ghibellines, who had for some time been the stronger party, were being worsted by the Gueiphs, Cino, a prominent member of the former faction, had to quit his office and the city of his birth. Piteccio, a stronghold on the frontiers of Lombardy, was yet in the hands of Filippo Vergiolo, chief of the Pistoiano Ghibellines; Selvaggia, his daughter, was beloved by Cino (who was probably already the husband of Margherita degli Unghi); and to Piteccio did the lawyer-poet betake himself. It is uncertain how long he remained at the fortress; it is certain, however, that he was not with the Vergiolo at the time of Selvaggia's death, which happened three years afterwards (1310), at the Monte della Sambuca, in the Apennines, whether the Ghibellines had been compelled to shoot their camp. He visited his mistress's grave on his way to Rome, after some time spent in travel in France and elsewhere, and to this visit is ascribed his finest sonnet. At Rome Cino held office under Louis of Savoy, sent thither by the Ghibelline leader Henry of Luxemburg, who was crowned emperor of the Romans in 1312. In 1313, however, the emperor died, and the Ghibellines lost their last hope. Cino appears to have thrown up his party, and to have returned to Pistoia. Thereafter he devoted himself to law and letters. After filling several high judicial offices, a doctor of civil law of Bologna in his forty-fourth year, he lectured and taught from the professor's chair at the universities of Treviso, Siena, Florence and Perugia in succession; his reputation and success were great, his judicial experience enabling him to travel out of the routine of the schools. In literature he continued in some sort the tradition of Dante during the interval dividing that great poet from his successor Petrarch. The latter, besides celebrating Cino in an obituary sonnet, has coupled him and his Selvaggia with Dante and Beatrice in the fourth canto of his Triomphe d'Amore.

Cino, the master of Barzatello, and of Joannes Andreac, the celebrated canonist, was long famed as a jurist. His commentary on the statutes of Pistoia, written within two years, is said to have great merit; while that on the code (Lectura Cino Pistoiae super codicem, Pavia, 1483; Lyons, 1526) is considered by Savigny to exhibit more practical intelligence and more originality of thought than are found in any commentary on Roman law since the time of Accursius. As a poet he also distinguished himself greatly. He was the friend and correspondent of Dante's later years, and possibly of his earlier also, and was certainly, with Guido Cavalcanti and Durante da Maiano, one of those who replied to the famous sonnet A ciascun alma presa e gentil core of the Vita Nuova. In the treatise De Vulgari Eloquentia Dante refers to him as one of "those who have most sweetly and surely written poems in modern Italian," but his works, printed at Rome in 1550, do not altogether justify the praise. Strained and rhetorical as many of his outcries are, however, Cino is not without moments of true passion and fine natural eloquence. Of these qualities the sonnet in memory of Selvaggia, Io fui in sull' alto e in mezzo monte, is perhaps the most interesting fact about him. See also Ciampi, Vita e poesie di messer Cino da Pistoia (Pisa, 1831).

CINQ-MARS, HENRI COIFFIER RÛZÉ D'EFFIAT, MARQUIS DE (1620-1642), French courtier, was the second son of Antoine Coiffer Rûzé, marquis d'Effiat, marshal of France (1581-1612), and was introduced to the court of Louis XIII. by Richelieu, who had been a friend of his father and who hoped he would counteract the influence of the queen's favourite Mlle. de Hautefort. Owing to his handsome appearance and agreeable manners he soon became a favourite of the king, and was made successively master of the wardrobe and master of the horse. After distinguishing himself at the siege of Arras in 1640, Cinq-Mars wished for a high military command, but Richelieu opposed his pretensions and the favourite talked rashly about overthrowing the minister. He was probably connected with the abortive rising of the count of Soissons in 1641; however, that matter is in the following year he formed an intrigue with the duke of Bouillon and others to overthrow Richelieu. This plot was under the nominal leadership of the king's brother Gaston of Orleans. The plans of the conspirators were aided by the illness of Richelieu and his absence from the king, and at the siege of Narbonne Cinq-Mars almost induced Leucis to agree to banish his minister. Richelieu, however, recovered, became acquainted with the attempt of Cinq-Mars to obtain assistance from Spain, and laid the proofs of his treason before the king, who ordered his arrest. Cinq-Mars was brought to trial, was convicted of his guilt, and was condemned to death. He was executed at Lyons on the 13th of September 1642. It is possible that Cinq-Mars was urged to engage in this conspiracy by his affection for Louise Marie de Gonzaga (1612-1667), afterwards queen of Poland, who was a prominent figure at the court of Louis XIII.; and this tradition forms part of the plot of Alfred de Vigny's novel Cinq-Mars.

CINQ MARS. Le P. Griflet, Histoire de Louis XIII; A. Bazin, Histoire de Louis XIII (1846); L. D'Asfarac de Frontin, Relations des choses particulières de la cour pendant la faveur de M. de Cinq-Mars.

CINQ CENTO (Italian for five hundred; short for 1500), in architecture, the style which became prevalent in Italy in the century following 1500, now usually called "16th-century work." It was the result of the revival of classic architecture known as Renaissance, but the change had commenced already a century earlier, in the works of Ghiberti and Donatello in sculpture, and of Brunelleschi and Alberti in architecture.

CINQ PORTS, the name of an ancient jurisdiction in the south of England, which is still maintained with considerable modifications and diminished authority. As the name implies,
the ports originally constituting the body were only five in number—Hastings, Romney, Hythe, Dover and Sandwich; but to these were afterwards added the "ancient towns" of Winchelsea and Rye with the same privileges, and a good many other places, both corporate and non-corporate, which, with the title of limb or member, held a subordinate position. To Hastings were attached the corporate members of Pevensey and Seaford, and the non-corporate members of Bulverhythe, Petit Iham (Yham or Higham), Hydney, Bekesbourn, Northney and Grenche or Graange; to Romney, Lydd, and Old Romney, Dengemarsh, Orwellstone, and Bromehill or Bromchill; to Dover, Folkestone and Faversham, and Margate, St John's, Goresend (now Birchington), Birchington Wood (now Woodchurch), St Peter's, Kingsdown and Ringwould; to Sandwich, Fordwich and Deal, and Walmer, Ramsgate, Reculver, Stonor (Esnanor), Sarre (or Serre) and Brightlingsea (in Essex). To Rye was attached the corporate member of Tenterden, and to a Hythe the non-corporate member of West Hythe. The jurisdiction thus extends along the coast from Seaford in Sussex to Birchington near Margate in Kent; and it also includes a number of inland districts, at a considerable distance from the ports with which they are connected. The non-incorporated members are within the municipal jurisdiction of the ports to which they are attached; but the corporate members are as free within their own liberties as the individual ports themselves.

The incorporation of the Cinque Ports had its origin in the necessity for some means of defence along the southern seaboard of England, and in the lack of any regular navy. Up to the reign of Henry VII. they had to furnish the crown with nearly all the ships and men that were needful for the state; and for a long time after they were required to give large assistance to the permanent fleet. The oldest charter now on record is one belonging to the 6th year of Edward I.; and it refers to previous documents of the time of Edward the Confessor and William the Conqueror. In return for their services the ports enjoyed extensive privileges. From the Conquest or even earlier they had, besides various lesser rights (1) exemption from tax and tallage; (2) soc and soc, or full cognizance of all criminal and civil cases within their liberties; (3) tol and toll, or the right of receiving toll and the right of compelling the person in whose hands stolen property was found to name the person from whom he received it; (4) bidowit and fletowit, or the right to punish shedders of blood and those who were seized in an attempt to escape from justice; (5) pillory and tumbril; (6) infangthenoth and outfangthenoth, or power to imprison and execute felons; (7) mundbryce (the breaking into or violation of a man's mund or property in order to erect banks or dikes as a defence against the sea); (8) waives and strays, or the right to appropriate lost property or cattle not claimed within a year and a day; (9) the right to seize all flotsam, jetsam, or ligan, or, in other words, whatever of value was cast ashore by the sea; (10) the privilege of being a gild with power to impose taxes for the common weal; and (11) the right of assembling in portmote or parliament at Shipway or Shipway Cross, a few miles west of Hythe (but afterwards at Dover), the parliament being empowered to make by-laws for the Cinque Ports, to regulate the Yarmouth fishery, to hear appeals from the local courts, and to give decision in all cases of treason, seditious, illegal coining or concealment of treasure trove.

The ordinary business of the ports was conducted in two courts known respectively as the court of brotherhood and the court of brotherhood and guesting—the former being composed of the mayors of the seven principal towns and a number of jurors and freemen from each, and the latter including in addition the mayors, bailiffs and other representatives of the corporate members. The court of brotherhood was formerly called the brotherhood assembly, and the name guesting seems to owe its origin to the fact that the officials of the "members" were at first in the position of invited guests.

The highest office in connexion with the Cinque Ports is that of the lord warden. who also acts as governor of Dover Castle, and has a maritime jurisdiction (vide infra) as admiral of the ports. His power was formerly of great extent, but he has now practically no important duty to exercise except that of chairman of the Dover harbour board. The emoluments of the office are confined to certain insignificant admiralty doth. The patronage attached to the office consists of the right to appoint the judge of the Cinque Ports admiralty court, the registrar of the Cinque Ports and the marshal of the court; the right of appointing salvage commissioners at each Cinque Port and the appointment of a deputy to act as chairman of the Dover harbour board in the absence of the lord warden. Walmer Castle was for long the official residence of the lord warden, but has, since the resignation of Lord Curzon in 1903, ceased to be so used, and those portions of it which are of historic interest are now open to the public. George, prince of Wales (lord warden, 1903-1907), was the first lord warden of royal blood since the office was held by George, prince of Denmark, consort of Queen Anne.

Admiralty Jurisdiction.—The court of admiralty for the Cinque Ports exercises a co-ordinate but not exclusive admiralty jurisdiction over persons and things found within the territory of the Cinque Ports. The limits of its jurisdiction were declared by an Act of Parliament annexed to the court of admiralty, held by the sea at Dover in 1682, to extend from Sheerwater in Kent to Redcliff, near Seaford, in Sussex; and with regard to salvage, they comprise all the sea between Seaford in Sussex to a point five miles off Cape Grisnez on the coast of France, and the coast of Essex. An older inquisition of 1526 is given by R.G. Marden in his Select Pleas of the Court of Admiralty, II. xxx. The court is an ancient one. The judge sits as the official and commissary of the lord warden, just as the judge of the high court of admiralty sat as the official and commissary of the lord high admiral. And, as the office of lord warden is more ancient than the office of lord high admiralty (The Lord Warden v. King in his office of Admiralty, 1831, 2 Hagg. Adm. Rep. 438), it is probable that the Cinque Ports court is the more ancient of the two.

The jurisdiction of the court has been, except in one matter of mere antiquarian curiosity, unaffected by statute. It exercises only, therefore, such jurisdiction as the high court of admiralty exercised, apart from restraining statutes of 1386 and 1391 and other statutes of 1840 and 1861. Cases of collision have been tried in the "Vivid," 1 Asp. Maritime Law Cases, 601. But salvage cases (the "Clarisse", Swaby, 129; the "Marie", Law Rep. 7 P.D. 203) are the principal cases now tried. It has no prize jurisdiction. The one case in which jurisdiction has been given to it by statute is to enforce forfeitures under the statute of 1538.

Dr. (afterwards the Right Hon. Robert Joseph) Phillimore succeeded his father as judge of the court from 1855 to 1875, being succeeded by Mr. Arthur Cohen, K.C. As Sir R. Phillimore was also the last judge of the high court of admiralty, from 1867 (the date of his appointment to the high court) to 1875, the two offices were, probably for the first time in history, held by the same person. Dr. Phillimore's patent had a grant of the "place or office of judge official and commissary of the court of admiralty of the Cinque Ports, and their members and appurtenances, and to be assistant to my lieutenant of Dover castle in all such affairs and business concerning the said court of admiralty wherein yourself and assistance shall be requisite and necessary." The office of the court sat sometimes at Sandwich, sometimes at other ports. But the regular place for the sitting of the court has for a long time been, and still is, the aisle of St. James's church, Dover. For convenience the judge often sits at the royal courts of justice. The office of marshal in the high court is represented in this court by a seargent, who also bears a silver oar. There is a registrar, as in the high court. The appeal is to the king in council, and is heard by the judicial committee of the privy council. The court can hear appeals from the Cinque Ports salvage commissioners, such appeals being final (Cinque Ports Act 1821). Actions may be transferred to it, and appeals made to it, from the county courts in all cases arising within the jurisdiction of the Cinque Ports as defined by that act. At the solemn installation of the lord warden the judge as the next principal officer installs him.
The Cinque Ports from the earliest times claimed to be exempt from the jurisdiction of the admirals of England. Their early charters do not, like those of Bristol and other seaports, express this exemption in terms. It seems to have been derived from the general words of the charters which preserve their liberties and privileges.

The lord warden's claim to prize was raised in, but not finally decided by, the high court of admiralty in the "Ooster Ems," 1 C. Rob. 284, 1738.

**CINTRA**, a town of central Portugal, in the district of Lisbon, formerly included in the province of Estramadura; 17 m. W.N.W. of Lisbon by the Lisbon-Caçem-Cintra railway, and 6 m. N. by E. of Cape da Roça, the westernmost promontory of the European mainland. Pop. (1900) 5914. Cintra is magnificently situated on the northern slope of the Serra da Cintra, a rugged mountain mass, largely overgrown with pines, eucalyptus, cork, and other forest trees, above which the principal summits rise in a succession of bare and jagged grey peaks; the highest being Cruz Alta (1772 ft.), marked by an ancient stone cross, and commanding a wonderful view southward over Lisbon and the Tagus estuary, and north-westward over the Atlantic and the plateau of Mafra. Few European towns possess equal advantages of position and climate; and every educated Portuguese is familiar with the verses in which the beauty of Cintra is celebrated by Byron in *Childe Harold* (1812), and by Camoens in the national epic *Os Lusíadas* (1572). One of the highest points of the Serra is surmounted by the Palácio da Pena, a fantastic imitation of a medieval fortress, built on the site of a Hieronymite convent by the prince consort Ferdinand of Saxe-Coburg (d. 1853); while an adjacent part of the range is occupied by the Castelo dos Mouros, an extensive Moorish fortification, containing a small ruined mosque and a very curious set of ancient cisterns. The lower slopes of the Serra are covered with the gardens and villas of the wealthier inhabitants of Lisbon, who migrate hither in spring and stay until late autumn.

In the town itself the most conspicuous building is a 14th-15th century royal palace, partly Moorish, partly debased Gothic in style, and remarkable for the two immense conical chimneys which rise like towers in the midst. The 15th century Palácio de Seteais, built in the French style then popular in Portugal, is said to derive its name ("Seven Ais") from a sevenfold echo; here, on the 22d of August 1808, was signed the convention of Cintra, by which the British and Portuguese allowed the French army to evacuate the kingdom without molestation. Beside the road which leads for 3½ m. W. to the village of Collares, celebrated for its wine, is the Penha Verde, an interesting country house and chapel, founded by João de Castro (1350-1358), fourth viceroy of the Indies. De Castro also founded the convent of Santa Cruz, better known as the Convento de Coñerta or Cork convent, which stands on the eastern extremity of the Serra, and owes its name to the cork panels which formerly lined its walls. Beyond the Penha Verde, on the Collares road, are the palace and park of Montserrat. The palace was originally built by William Beckford, the novelist and traveller (1760-1844), and was purchased in 1856 by Sir Francis Cook, an Englishman who afterwards obtained the Portuguese title viscount of Montserrat. The palace, which contains a valuable library, is built of pure white stone, in Moorish style; its walls are elaborately sculptured. The park, with its tropical luxuriance of vegetation and its variety of lake, forest and mountain scenery, is by far the finest example of landscape gardening in the Iberian Peninsula, and probably among the finest in the world. Its high-lying lawns, which overlook the Atlantic, are as perfect as any in England, and there is one ravine containing a whole wood of giant tree-ferns from New Zealand. Other rare plants have been systematically collected and brought to Montserrat from all parts of the world by Sir Francis Cook, and afterwards by his successor, Sir Frederick Cook, the second viscount. The Praza das Maças, or "beach of apples," in the centre of a rich fruit-bearing valley, is a favourite sea-bathing station, connected with Cintra by an extension of the electric tramway which runs through the town.

**CIPHER**, or Cypher (from Arab. šifr, void), the symbol 0, nought, or zero; and so a name for symbolic or secret writing (see Cryptography), or even for shorthand (g.v.), and also in elementary education for doing simple sums ("ciphering").

**CIPPIUS** (Lat. for a "post" or "stake"), in architecture, a low pedestal, either round or rectangular, set up by the Romans for various purposes such as military or mile stones, boundary posts, &c. The inscriptions on some in the British Museum show that they were occasionally funeral memorials.

**CIPRIANI, GIOVANNI BATTISTA** (1727-1785), Italian painter and engraver, Pistoiese by descent, was born in Florence in 1727. His first lessons were given him by an Englishman, Ignatius Heckford or Hugford, and under his second master, Antonio Domenico Gabbiani, he became a very clever draughtsman. He was in Rome from 1750 to 1753, where he became acquainted with Sir William Chambers, the architect, and Joseph Wilton, Sir Robert Walpole's eldest son, who accompanied him to England in August 1755. He had already prepared two designs of buildings, or a palace in Puglia named Michele in Pelago, Pistoia, which had brought him reputation, and on his arrival in England he was patronized by Lord Teyler, the duke of Richmond and other noblemen. His acquaintance with Sir William Chambers no doubt helped him on, for when Chambers designed the Albany in London for Lord Holland, Cipriani painted a ceiling for him. He also painted part of a ceiling in Buckingham Palace, and a room with poetical subjects at Standlynch in Wiltshire. Some of his best and most permanent work was, however, done at Somerset House, built by his friend Chambers, upon which he laboured infinite pains. He not only prepared the decorations for the interior of the north block, but, says Joseph Baretti in his *Guide through the Royal Academy* (1780), "the whole of the carvings in the various fronts of Somerset Place—excepting Bacon's bronze figures—were carved from finished drawings made by Cipriani." These designs include the five masks forming the keystones to the arches on the court side of the vestibule, and the two above the doors leading into the wings of the north block, all of which are believed to have been carved by Nollekens. The grotesque groups flanking the main doorways on three sides of the quadrangle and the central doorway on the terrace appear also to have been designed by Cipriani. The apartments in Sir William Chambers's stately palace that were assigned to the Royal Academy, into which it moved in 1780, owed much to Cipriani's graceful, if mannered, pencil. The central panel of the library ceiling was painted by Sir Joshua Reynolds, but the four compartments in the coves, representing Allegory, Fable, Nature and History, were Cipriani's. These paintings still remain at Somerset House, together with the emblematic painted ceiling, also his work, of what was once the library of the Royal Society. It was natural that Cipriani should thus devote himself to adorning the apartments of the academy, for he was an original member (1768) of that body, for which he designed the diploma so well engraved by Henry Suter in 1774. In 1770, Cipriani, in return for his services in this respect the members presented him in 1789 with a golden statuette with a commemorative inscription. He was much employed by the publishers, for whom he made drawings in pen and ink, sometimes coloured. His friend Bartolozzi engraved most of them. Drawings by him are in both the British Museum and Victoria and Albert Museum. His best autograph engravings are "The Death of Cleopatra," after Benvenuto Cellini; "The Descent of the Holy Ghost," after Gabbiani; and portraits for Holli's memoirs, 1780. He painted allegorical designs for George III's state coach—which is still in use—in 1782, and repaired Verrio's paintings at Windsor and Rubens's ceiling in the Banqueting House at Whitehall. If his pictures were often weak, his decorative treatment of children was usually exceedingly happy. Some of his most pleasing work was that which, directly or indirectly, he executed for the decoration of furniture. He designed many groups of nymphs and amorini and medallion subjects to form
the centre of Pergolesi's hands of ornament, and they were continually reproduced upon the elegant satin-wood furniture which was growing popular in his later days and by the end of the 18th century became a rage. Sometimes these designs were inlaid in marquetry, but most frequently they were painted upon the satin-wood by other hands with delightful effect, since in the whole range of English furniture there is nothing more enchanting than really good finished satin-wood pieces. There can be little doubt that some of the beautiful furniture designed by the Adams was actually painted by Cipriani himself. He also occasionally designed handles for drawers and doors. Cipriani died at Hammersmith in 1785 and was buried at Chelsea, where Bartolozzi erected a monument to his memory. He had married an English lady, by whom he had two sons.

CIRCAR, an Indian term applied to the component parts of a subah or province, each of which is administered by a deputy-governor. In English it is principally employed in the name of the Northern CIRCARs, used to designate a now obsolete division of the Madras presidency, which consisted of a narrow strip of territory lying along the western side of the Bay of Bengal from 15° 40' to 20° 17' N. lat. These Northern CIRCARs were five in number, Chicacole, Rajahmundry, Ellore, Kondapalli and Guntur, and their total area was about 30,000 sq. m.

The district corresponds in the main to the modern districts of Kistna, Godavari, Vizagapatam, Gajapam and a part of Nellore. It was first invaded by the Mahomedans in 1471; in 1541 they conquered Kondapalli, and nine years later they extended their conquests over all Guntur and the districts of Masulipatam. But the invaders appear to have acquired only an imperfect possession of the country, as it was again wrested from the Hindu princes of Orissa about the year 1571, during the reign of Ibrahim, the Kuth Shahi dynasty of Hyderabad or Golconda. In 1687 the CIRCARs were added, along with the empire of Hydembad, to the extensive empire of Aurungzeb. Salabat Jang, the son of the nizam ul mulk Asaf Jah, who was indebted for his elevation to the throne to the French East India Company, granted them in return for their services the district of Kondavid or Guntur, and soon afterwards the other CIRCARs. In 1759, by the conquest of the fortress of Masulipatam, the dominion of the maritime provinces on both sides, from the river Gundlakamma to the Chilka lake, was necessarily transferred from the French to the British. But the latter left them under the administration of the nizam, with the exception of the town and fortress of Masulipatam, which were retained by the English East India Company. In 1765 Lord Clive obtained from the Mogul emperor Shah Alam a grant of the five CIRCARs. Hereupon the fort of Kondapalli was seized by the British, and on the 12th of November 1766 a treaty of alliance was signed with Nizam Ali by which the Company, in return for the grant of the CIRCARs, undertook to maintain troops for the nizam's assistance. By a second treaty, signed on the 1st of March 1768, the nizam acknowledged the validity of Shah Alam's grant and resigned the CIRCARs to the Company, receiving as a mark of friendship an annuity of £15,000. Guntur, as the personal estate of the nizam's brother Basalt Jang, was excepted during his lifetime under both treaties. He died in 1782, but it was not till 1788 that Guntur came under British administration. Finally, in 1823, the claims of the nizam over the Northern CIRCARs were bought outright by the Company, and they became a British possession.

CIRCASSIA, a name formerly given to the north-western portion of the Caucasus, including the district between the mountain range and the Black Sea, and extending to the north of the central range as far as the river Kouban. Its physical features are described in the article on the Russian province of KUBAN, with which it approximately coincides. The present article is confined to a consideration of the ethnographical relations and characteristics of the people, their history being treated under CAUCASIA.

The Cherkesses or Circassians, who gave their name to this region, of which they were until lately the sole inhabitants, are a peculiar race, differing from the other tribes of the Caucasus in origin and language. They designate themselves by the name of Adigbeh, that of Cherkesses being a term of Russian origin. By their long-continued struggles with the power of Russia, during a period of nearly forty years, they attracted the attention of the other nations of Europe in a high degree, and were at the same time an object of interest to the student of the history of civilization, from the strange mixture which their customs exhibited of chivalrous sentiment with savage customs. For this reason it may be still worth while to give a brief summary of their national characteristics and manners, though these must now be regarded as in great measure things of the past.

In the patriarchal simplicity of their manners, the mental qualities with which they were endowed, the beauty of form and regularity of feature by which they were distinguished, they surpassed most of the other tribes of the Caucasus. At the same time they were remarkable for their warlike and intrepid character, their independence, their hospitality to strangers, and that love of country which they manifested in their determined resistance to an almost overwhelming power during the period of a long and desolating war. The government under which they lived was a peculiar form of the feudal system. The free Circassians were divided into three distinct ranks, the princes or peeti, the nobles or work (Tatar uiden), and the peasants or kokol. Like the inhabitants of the other regions of the Caucasus, they were also divided into numerous families, tribes or clans, some of which were very powerful, and carried on war against each other with great animosity. The slaves, of whom a large proportion were prisoners of war, were generally employed in the cultivation of the soil, or in the domestic service of some of the principal chiefs.

The will of the people was acknowledged as the supreme source of authority; and every free Circassian had a right to express his opinion in those assemblies of his tribe in which the questions of peace and war, almost the only subjects which engaged their attention, were brought under deliberation. The princes and nobles, the leaders of the people in war and their rulers in peace, were only the administrators of a power which was delegated to them. As they had no written laws, the administration of justice was regulated solely by custom and tradition, and in those tribes professing Mahomedanism by the precepts of the Koran. The most aged and respected inhabitants of the various ouls or villages frequently sat in judgment, and their decisions were received without a murmur by the contending parties. The Circassian princes and nobles were professedly Mahomedans; but in their religious services many of the ceremonies of their former heathen and Christian worship were still preserved. A great part of the people had remained faithful to the worship of their ancient gods—Shible, the god of thunder, of war and of justice; Tlips, the god of fire; and Seoseres, the god of water and of winds. Although the Circassians are said to have possessed minds capable of the highest cultivation, the arts and sciences, with the exception of poetry and music, were completely neglected. They possessed a language. The wisdom of their sages, the knowledge they had acquired, and the memory of their warlike deeds were preserved in verses, which were repeated from mouth to mouth and descended from father to son.

The education of the young Circassian was confined to riding, fencing, shooting, hunting, and such exercises as were calculated to strengthen his frame and prepare him for a life of active warfare. The only intellectual duty of the atalik or instructor, with whom the young men lived until they had completed their education, was that of teaching them to express their thoughts shortly, quickly and appropriately. One of their marriage ceremonies was very strange. The young man who had been approved by the parents, and had paid the stipulated price in money, horses, oxen, or sheep for his bride, was expected to come with his friends fully armed, and to carry off her by force from her father's house. Every free Circassian had unlimited right over the lives of his wife and children. Although polygamy was allowed by the laws of the Koran, the custom of the country forbade it, and the Circassians were generally faithful to the

CIRCE—CIRCEIUS MONS

marriage bond. The respect for superior age was carried to such an extent that the young brother used to rise from his seat when the elder entered an apartment, and was silent when he spoke. Like all the other inhabitants of the Caucasus, the Circassians were distinguished for two very opposite qualities—the most generous hospitality and implacable vindictiveness. Hospitality to the stranger was considered one of the most sacred duties. Whatever was his rank in life, all the members of the family rose to receive him on his entrance, and conduct him to the principal seat in the apartment. The host was consi-dered responsible for his own life for the security of his guest, upon whom, even although his deadliest enemy, he would inflict no injury while under the protection of his roof. The chief who had received a stranger was also bound to grant him an escort of horse to conduct him in safety on his journey, and confide him to the protection of those nobles with whom he might be on friendly terms. The law of vengeance was no less binding on the Circassian. The individual who had slain any member of a family was pursued with implacable vengeance by the relatives, until his crime was expiated by death. The murderer might, indeed, secure his safety by the payment of a certain sum of money, or by carrying off from the house of his enemy a newly-born child, bringing it up as his own, and restoring it when its education was finished. In either case, the family of the slain individual might discontinue the pursuit of vengeance without any stain upon its honor. The man was avenged by his enemy, who, on reaching the dwelling of a woman, had merely touched her hand, was safe from all other pursuit so long as he remained under the protection of her roof. The opinions of the Circassians regarding theft resembled those of the ancient Spartans. The commission of the crime was not considered so disgraceful as its discovery; and the punishment of being compelled publicly to restore the stolen property to its original possessor, amid the derision of his tribe, was much dreaded by the Circassian who would glory in a successful theft. The greatest stain upon the Circassian character was the custom of selling their children, the Circassian father being always willing to part with his daughters, many of whom were bought by Turkish merchants for the harems of Eastern monarchs. But no degradation was implied in this transaction, and the young women themselves were generally willing partners in it. Herds of cattle and sheep constituted the chief riches of the inhabitants. The princes and nobles, from whom the members of the various tribes held the land which they cultivated, were the proprietors of the soil. The Circassians carried on little or no commerce, and the state of perpetual warfare in which they lived prevented them from cultivating any of the arts of peace.

CIRCE (Gr. Κύρη), in Greek legend, a famous sorceress, the daughter of Helios and the ocean nymph Persé. Having murdered her husband, the prince of Colchis, she was expelled by her subjects and placed by her father on the solitary island of Aeaea on the coast of Italy. She was able by means of drugs and incantations to change human beings into the forms of wolves or lions, and with these beings her palace was surrounded. Here she was found by Odysseus and his companions; the latter she changed into swine, but the hero, protected by the herb moly (q.v.), which he had received from Hermes, not only forced her to restore them to their original shape, but also gained her love. For a year he relinquished himself to her endearments, and when he determined to leave, she instructed him how to sail to the land of shades which lay on the verge of the ocean stream, in order to learn his fate from the prophet Teiresias. Upon his return she also gave him directions for avoiding the dangers of the journey home (Homer, Odyssey, x.–xii.; Hyginus, Fab. 125). The Roman poets associated her with the most ancient traditions of Latium, and assigned her a home on the promontory of Circe (Virgil, Aeneid, vii. 10). The metamorphoses of Scylla and of Picus, king of the Ausonians, by Circe, are narrated in Ovid (Metamorphoses, xiv.).

The Myth of Circe, by R. Brown (1889), in which Circe is explained as a moon-goddess of Babylonian origin, contains an exhaustive summary of facts, although many of the author’s speculations may be proved untenable (review by H. Bradley in Academy, January 19, 1884); see also J. E. Harrison, Myths of the Odyssey (1882); C. Seeiger in W. H. Roscher's Lexikon der Mythologie.

CIRCEIUS MONS (mod. Monte Circeo), an isolated promontory on the S.W. coast of Italy, about 80 m. S.E. of Rome. It is a ridge of limestone about 33 m. long by 1 m. wide at the base, running from E. to W. and surrounded by the sea on all sides except the N. The land to the N. of it is 53 ft. above sea-level, while the sum of the promontory is 1775 ft. The origin of the name is uncertain: it has naturally been connected with the legend of Circe, and Victor Béard (in Les Phénomènes et l'Odyssé, ii. 261 seq.) maintains in support of the identification that Alain, the Greek name for the island of Circe, is a faithful transliteration of a Semitic name, meaning "island of the hawk," of which nēros Kipras is the translation. The difficulty has been raised, especially by geologists, that the promontory ceased to be an island at a period considerably before the time of Homer; but Ptolemy very truly remarked that the promontory has all the appearance of an island until one is actually upon it. Upon the E. end of the ridge of the promontory are the remains of an enceinte, forming roughly a rectangle of about 200 by 100 yds. of very fine polygonal work, on the outside, the blocks being very carefully cut and jointed and right angles being intentionally avoided. The wall stands almost entirely free, as at Arpinum—polygonal walls in Italy are as a rule embanking walls—and increases considerably in thickness as it descends. The blocks of the inner face are much less carefully worked both here and at Arpinum. It seems to have been an acropolis, and contains no traces of buildings, except for a subterranean cistern, circular, with a beehive roof of converging blocks. The modern village of S. Felice Circeo seems to occupy the site of the ancient town, the citadel of which stood on the mountain top, for its medieval walls rest upon ancient walls of Cyclopean work of less careful construction than those of the citadel, and enclosing an area of 200 by 150 yds.

Circé was founded as a Roman colony at an early date—according to some authorities in the time of Tarquinus Superbus, but more probably about 300 B.C. The existence of a previous population, however, is very likely indicated by the revolt of Circei in the middle of the 4th century B.C., so that it is doubtful whether the walls described are to be attributed to the Romans or to the earlier Volscian inhabitants. At the time of the republic, however, or at least at the beginning of the imperial period, the city of Circei was no longer at the E. end of the promontory, but on the E. shores of the Lago di Paola (a lagoon—now a considerable fishery—separated from the sea by a line of sandhills and connected with it by a channel of Roman date: Strabo speaks of it as a small harbour) one mile N. of the E. end of the promontory. Here are the remains of a Roman town, belonging to the 1st and 2nd centuries, extending over an area of some 600 by 500 yards, and consisting of fine buildings along the lagoons, including a large open piscina or basin, surrounded by a double portico, while farther inland are several very large and well-preserved water-reservoirs, supplied by an aqueduct of which traces may still be seen. An inscription speaks of an amphitheatre, of which no remains are visible. The transference of the city did not, however, mean the abandonment of the E. end of the promontory, on which stand the remains of several very large villas. An inscription, indeed, cut in the rock near S. Felice, speaks of this part of the promontarium Veneris (the only case of the use of this name) as belonging to the city of Circei. On the S. and N. sides of the promontory there are comparatively few buildings, while at the W. end there is a sheer precipice to the sea. The town on the acquired municipal rights after the Social War, and was a place of little importance, except as a seaside resort. For its villas Cicero compares it with Antium, and probably both Tiberius and Domitian possessed residences there. The beetroot and oysters of Circei had a certain reputation. The view from the highest summit of the promontory (which is occupied by ruins of a platform attributed with great probability to a temple of Venus or Circe) is of remarkable beauty; the whole mountain is covered with fragrant

CIRCLES

(shrubs. From any point in the Pomptine Marshes or on the coast-line of Latium the Cicerian promontory dominates the landscape in the most remarkable way.

See T. Ashby, "Monte Cicerio," in 
M\(\text{i}\)-\(\text{u}\)-\(\text{a}\)-\(\text{n}\)-\(\text{g}e\)-\(\text{s}\) \(\text{e}\) \(\text{l}\)\(\text{e}c\) \(\text{e}\) \(\text{f}r\) \(\text{a}\) \(\text{n}\) \(\text{s}\) \(\text{e}\) \(\text{r}\) \(\text{v}\) \(\text{v}\) \(\text{v}\) \(\text{e}\) \(\text{r}\) \(\text{y}\) (1905) 157 seq. (T. As.)

CIRCLES (from the lat. \(\text{c}\)\(\text{i}\)\(\text{r}\)\(\text{i}\)\(\text{l}\)\(\text{s}\)\(\text{i}\)\(\text{u}\)\(\text{r}\)\(\text{i}\)\(\text{u}\)\(\text{s}\)\(\text{i}\)\(\text{u}\)\(\text{s}\)\(\text{i}\)\(\text{s}\)\(\text{a}\), the diminutive of \(\text{c}\)\(\text{i}\)\(\text{r}\)\(\text{i}\)\(\text{s}\)\(\text{a}\), a ring; the cognate Gr. word is \(\text{κ}\)\(\text{i}\)\(\text{r}\)\(\text{i}\)\(\text{s}\)\(\text{a}\)\(\text{s}\), generally used in the form \(\text{κ}\)\(\text{i}\)\(\text{r}\)\(\text{i}\)\(\text{s}\)\(\text{a}\)\(\text{s}\), a plane curve definable as the locus of a point which moves so that its distance from a fixed point is constant.

The term of a circle is familiar to all; and we proceed to define certain lines, points, \&c., which constantly occur in studying its geometry. The fixed point in the preceding definition is termed the "centre" (C in fig. 1); the constant distance, e.g., CG, the "radius." The curve itself is sometimes termed the "circumference." Any line through the centre and terminated at both extremities by the curve, e.g., AB, is a "diameter"; any line similarly terminated, e.g., EF, a "chord." Any line drawn from an external point to cut the circle in two points, e.g., DEF, is termed a "secant"; if it touches the circle, e.g., DG, it is a "tangent." Any portion of the circumference terminated by two points, e.g., AD (fig. 2), is termed an "arc," and the plane figure enclosed by a chord and arc, e.g., ABD, is termed a "segment." If the chord be a diameter, the segment is termed a "semi-circle." The figure included by two radii and an arc is a "sector," e.g., ECF (fig. 2). "Concentric circles" are, as the name obviously shows, circles having the same centre; the figure enclosed by the circumferences of two concentric circles is an "annulus" (fig. 3), and of two non-concentric circles a "lune," the shaded portions in fig. 4; the clear figure is sometimes termed a "lens."

The circle was undoubtedly known to the early civilizations, its simplicity specially recommending it as an object for study. Euclid defines it (Book I. def. 15) as a "plane figure enclosed by one line, all the straight lines drawn to which from one point within the figure are equal to one another." In the succeeding three definitions the centre, diameter and the semicircle are defined, while the third postulate of the same book demands the possibility of describing a circle for every centre and "distance." Having employed the circle for the construction and demonstration of several propositions in Books I. and II. Euclid devotes his third book entirely to theorems and problems relating to the circle, and certain lines and angles, which he defines in introducing the propositions. The fourth book deals with the circle in its relations to inscribed and circumscribed triangles, quadrilaterals and regular polygons. Reference should be made to the article GEOMETRY: Euclidean, for a detailed summary of the Euclidean treatment, and the elementary properties of the circle.

Analytical Geometry of the Circle.

In the article GEOMETRY: Analytical, it is shown that the general equation to a circle in rectangular Cartesian co-ordinates is \(x^2+y^2+2gx+2fy+c=0\), i.e., in the general equation of the second degree the co-efficients of \(x^2\) and \(y^2\) are equal, and of \(xy\) zero. The co-ordinates of its centre are \(-g, -f\); and its radius is \((\sqrt{g^2+f^2-c})\). The equations to the chord, tangent and normal are readily derived by the ordinary methods.

Consider the two circles:

\[x^2+y^2+2gx+2fy+c=0, \quad x^2+y^2+2gx+2fy+c'=0.\]

Obviously these equations show that the curves intersect in four points, two of which lie on the intersection of the line, \(2(g-x)x+2(f-y)y+c-c'=0\), the radical axis, with the circles, and the other two where the lines \(x^2+y^2=(x+ty)(x-ty)\) (where \(t\) is a parameter) cut the circles. The positions of the intersections may be either real or imaginary; we proceed to discuss the second pair.

The equation \(x^2+y^2=0\) denotes a pair of perpendicular imaginary lines; it follows, therefore, that circles always intersect in two pairs of points at infinity along these lines, and since the terms \(x^2+y^2\) occur in the equation of every circle, it is seen that all circles pass through two fixed points at infinity. The introduction of these lines and points constitutes a striking achievement in geometry, since the conic sections are known with this assumption.

Having made this circle the common base of all the others, we can see that the circle is a new name. For the "circumference" and "circles." Other names for the circular lines are "circular" or "isotopic lines." Since the equation to a circle of zero radius is \(x^2+y^2=0\), i.e., identical with the circular lines, it follows that this circle consists of a real point and the two imaginary points where the circle crosses the imaginary lines. A pair of circles, each of which consists of two imaginary points (with coincident centres) and a pair of lines (and a circle). A further deduction from the principle of continuity follows by considering the intersections of concentric circles. The equations to such circles may be expressed in the form \(x^2+y^2=a\), where \(a\) is a parameter, and where they intersect the lines \(x^2+y^2=0\), i.e., concentric circles have double contact at the circular points, the chord of contact being the line at infinity.

In various systems of triangular co-ordinates the equations to circles specially related to the triangle of reference assume comparatively simple forms; consequently they provide elegant algebraical demonstrations of properties concerning a triangle and the circles intimately associated with its geometry. In this article the more important circles—the circumcircle, incircle, excircles, etc.—are described.
CIRCLE

383

by the relation \(2\lambda (p - q) (p - r) = 4\Delta^2\) (see Geometry: Analytical, which is generally written \([ap, bq, cr]^2 = 4\Delta^2\), we obtain \([ap, bq, cr]^2 = 4\Delta^2(p^2 + m^2 + n^2)/(1 + m^2 + n^2)\), the accents being dropped, and \(p, q, r\) regarded as current co-ordinates. This equation, which may be more conveniently written \([ap, bq, cr]^2 = 4\Delta^2(p^2 + m^2 + n^2)/(1 + m^2 + n^2)\), forms the basis of the construction of the centres, the centres being \(p, q, r\) and radius \(2\lambda (\lambda + m + n)\). If we make \(p = q = r = \infty\), we obtain \([ap, bq, cr]^2 = \infty\) as the equation to the circular points.

Systems of Circles.

Centres and Circle of Similitude.—The "centres of similitude" of two circles may be defined as the intersections of the common tangents to the two circles, the direct common tangents giving rise to the "external centre," the transverse tangents to the "internal centre." It may be readily shown that the external and internal centres are the points where the line joining the centres of the two circles is divided externally and internally in the ratio of their radii.

The circle on the line joining the internal and external centres of similitude as diameter is named the "circle of similitude." It may be shown to be the locus of the vertex of the triangle which has for its base the distance between the centres of the circles and the ratio of the remaining sides equal to the ratio of the radii of the two circles.

With a system of three circles it is readily seen that there are six centres of similitude, viz., two for each pair of circles, and it may be shown that these lie three by three on four lines, named the "axes of similitude." The collinear centres are the three sets of one external and two internal centres, and the three external centres.

Coaxal Circles.—A system of circles is coaxal when the locus of points from which tangents to the circles are equal is a straight line. Consider the case of two circles, and in the first place suppose them to intersect in two real points A and B. Then by Euclid iii. 36 it is seen that the line joining the points A and B is the line of intersection of equal tangents, for if P be any point on AB and PC and PD the tangents to the circles, then PA PB = PC2 = PD2, and therefore PC = PD. Furthermore it is seen that AB is perpendicular to the line joining the centres, and divides it in the ratio of the squares of the radii. The line AB is termed the "radical axis." A system coaxal with the two given circles is readily constructed by describing circles through the common points on the radical axis and any third point; the minimum circle of the system is obviously that which has the common chord of intersection for diameter, the maximum is the radical axis—considered as a circle of infinite radius. In the case of two non-intersecting circles it may be shown that the radical axis has the same metrical relations to the lines of centres.

There are several methods of constructing the radical axis in this case. One of the simplest is: Let P and P' (fig. 5) be the points of contact of a common tangent; draw perpendiculars from P and P' to OX, the line joining the centres, then the radical axis bisects LL' (at X) and is perpendicular to OX.

To prove this let AB be the tangents from any point on the line AX, then by Eucl. i. 47, \(AB = AB' = OD^2 - DX^2 = OP^2 - PD^2 - DX^2\). Similarly \(AB'' = AX^2 - DX^2 + PD^2\). Since PD = PD', it follows that \(AB = AB'\).

To construct circles coaxal with the two given circles, draw the tangent, say XR, from X, the point where the radical axis intersects the line of centres, to one of the given circles, and with centre X and radius XR describe a circle. Then circles having the intersections of tangents to this circle and the line of centres for centres, and the lengths of the tangents as radii, are members of the coaxal system.

In the case of non-intersecting circles, it is seen that the minimum circles of the coaxal system are a pair of points I and I', where the orthogonal centre to the system intersects the line of centres; these points are named the "limiting points." In the case of a coaxal system having real points of intersection the limiting points are imaginary. Analytically, the Cartesian equation to a coaxal system can be written in the form \(x^2 + y^2 + 2ax - k = 0\), where \(a\) varies from member to member, while \(k\) is a constant. The radical axis is \(x = 0\), and it may be shown that the length of the tangent from a point \((x, y)\) is \(k + x^2\), i.e. it is independent of \(a\), and therefore of any particular member of the system. The circles intersect in real or imaginary points according to the lower or upper sign of \(k\), and the limiting points are real for the upper sign and imaginary for the lower sign.

The fundamental properties of coaxal systems may be summarized:

1. The centres of circles forming a coaxal system are collinear.
2. A coaxal system having real points of intersection has imaginary limiting points.
3. A coaxal system having imaginary points of intersection has real limiting points.
4. Every circle through the limiting points cuts all circles of the system orthogonally.
5. The limiting points are inverse points for every circle of the system.

The theory of centres of similitude and coaxal circles affords elegant demonstrations of the famous problem: To describe a circle to touch three given circles. This problem, also termed the "Apollonian problem," was demonstrated with the aid of conic sections by Apollonius in his book On Contacts or Tangencies; geometrical solutions involving the conic sections were also given by Adrianus Romanus, Vieta, Newton and others. The earliest analytical solution appears to have been given by the princess Elizabeth, a pupil of Descartes and daughter of Frederick V. John Casey, professor of mathematics at the Catholic university of Dublin, has given elementary demonstrations founded on the theory of similitude and coaxal circles which are reproduced in his Sequel to Euclid; an analytical solution by Gergonne is given in Salmon's Conic Sections. Here we may notice that there are eight circles which solve the problem.

Mensuration of the Circle.

All exact relations pertaining to the mensuration of the circle involve the ratio of the circumference to the diameter. This ratio, invariably denoted by \(\pi\), is constant for all circles, but it does not admit of exact arithmetical expression, being of the nature of an incommensurable number. Very early in the history of geometry it was known that the circumference and area of a circle of radius \(r\) could be expressed in the forms \(2\pi r\) and \(\pi r^2\).

The exact geometrical evaluation of the second quantity, viz. \(\pi r^2\), which, in reality, is equivalent \(\pi\), determining a square equal in area to a circle, engaged the attention of mathematicians for many centuries. The history of these attempts, together with modern contributions to our knowledge of the value and nature of the number \(\pi\), is given below (Squaring of the Circle).

The following table gives the values of this constant and several expressions involving it:

<table>
<thead>
<tr>

<td>1.0995577</td>
</tr>
</tbody>
</table>

Useful fractional approximations are \(22/7\) and \(355/113\). A synopsis of the leading formula connected with the circle will now be given.

1. Circle.—Data: radius = \(r\). Circumference = \(2\pi r\). Area = \(\pi r^2\).
2. Arc and Sector.—Data: radius = \(r\); \(\theta\) = circular measure of angle subtended at centre by arc; \(e\) = chord of arc; \(c\) = chord of semi-arc; \(c\) = chord of quarter-arc.
Exact formulae are: \( \text{Arc} = \theta \), where \( \theta \) may be given directly, or indirectly by the relation \( \epsilon = \theta \sin \theta \). Area of sector = \( \frac{1}{2} \theta^2 \).

Approximate formulae are: \( \text{Arc} = \pi (8\theta - e) \) (Huygens’ formula); \( \text{Arc} = \frac{\sqrt{2} - 1}{2} \theta \).

3. Segment. Data: \( \theta, \theta, \phi, \phi \), as in (2); \( h \) = height of segment, \( i.e. \) distance of mid-point of arc from chord.

Exact formulae are: \( \text{Area} = \frac{\theta^2}{2} - \frac{\theta^2}{2} \cot \frac{\theta}{2} \cot \frac{\theta}{2} \).

If \( h \) be given, we can use \( c^2 = 4h \tan \frac{\theta}{2}, \theta = \frac{\sqrt{2} - 1}{2} \theta \) to determine \( \theta \).

Approximate formulae are: \( \text{Area} = \frac{\sqrt{2} \theta + \theta^2}{2} \).

Squaring of the Circle.

The problem of finding a square equal in area to a given circle, like all problems, may be increased in difficulty by the imposition of restrictions; consequently under the designation there may be embraced quite a variety of geometrical problems. It has to be noted, however, that, when the “squaring” of the circle is especially spoken of, it is almost always tacitly assumed that the restrictions are those of the Euclidean geometry.

Since the area of a circle equals that of the rectilinear triangle whose base has the same length as the circumference and whose altitude equals the radius (Archimedes, \( \text{Kőwov } \mu \kappa \rho \pi \rho \sigma \mu \alpha s \), prop. 1), it follows that, if a straight line could be drawn equal in length to the circumference, the required square could be found by an ordinary Euclidean construction; also, it is evident that, conversely, if a square equal in area to the circle could be obtained it would be possible to draw a straight line equal to the circumference.

Rectification and quadrature of the circle have thus been, since the time of Archimedes at least, practically identical problems. Again, since the circumferences of circles are proportional to their diameters—a proposition assumed to be true from the dawn almost of practical geometry—the rectification of the circle is seen to be transformable into finding the ratio of the circumference to the diameter. This correlative numerical problem and the two purely geometrical problems are inseparably connected historically.

Probably the earliest value for the ratio was \( 3 \). It was so among the Jews (1 Kings vii. 23), the Babylonians (Oppert, \( \text{Journ. asiatique} \), August 1872, October 1874), the Chinese (Biot, \( \text{Journ. asiatique} \), June 1841), and probably also the Greeks, Among the ancient Egyptians, as would appear from a calculation in the Rhind papyrus, the number \( \left( \frac{22}{7} \right) \), i.e. \( 3 \cdot 1605 \), was at one time in use.\(^1\) The first attempts to solve the purely geometrical problem appear to have been made by the Greeks (Anaxagoras, &c.)\(^2\), one of whom, Hippocrates, doubtless raised hopes of a solution by his quadrature of the so-called \( m e n i s c o i \) or \( l u n e s \).\(^3\)

The Greeks were in possession of several relations pertaining to the quadrature of the lune. The following are among the more interesting. In fig. 6, \( ABC \) is an isosceles triangle right angled at \( C \), \( ADB \) is the semicircle described on \( AB \) as diameter, \( AEB \) the circle described as centre \( C \), and radius \( CA = CB \). It is easily shown that the areas of the lune \( ADBE \) and the triangle \( ABC \) are equal. In fig. 7, \( ABC \) is any triangle

CIRCLE

The next to advance the calculation was Francisco Vieta. By finding the perimeter of the inscribed and that of the circumscribed regular polygon of 393216 (i.e. 6×246) sides, he proved that the ratio was >\(3.1415926535\) and <\(3.1415926537\), so that its value became known in (1579) correctly to 10 fractional places. The theorem for angle-bisection which Vieta used was that of Archimedes, but that which would now appear in the form
\[1 - \cos \theta = 2 \sin^2 \theta.\]
With Vieta, by reason of the advance in arithmetic, the style of treatment becomes more strictly trigonometrical; indeed, the *Universales Investigationes* in which the calculation occurs, would now be called plane and spherical trigonometry, and the accompanying Canon mathematicus a table of sines, tangents and secants. Further, in comparing the labours of Archimedes and Vieta, the effect of increased power of symbolical expression is very noticeable. Archimedes's process of unending cycles of arithmetical operations could at best have been expressed in his time by a "rule" in words; in the 16th century it could be condensed into a "formula." Accordingly, we find in Vieta a formula for the ratio of diameter to circumference, viz. the intermediate product
\[
\sqrt{3 - \frac{\sqrt{3}}{2}} \cdot \sqrt{3 + \frac{\sqrt{3}}{2}} \cdot \sqrt{3 + \frac{\sqrt{3}}{2}} \cdot \sqrt{3 - \frac{\sqrt{3}}{2}} \cdots
\]

This point onwards, therefore, no knowledge whatever of geometry was necessary in any one who desired to determine the ratio to any required degree of accuracy; the problem being reduced to an arithmetical computation. Thus in connexion with the subject a genus of workers became possible who may be styled "π-computers or circle-squarers"—a name which, if it connotes anything than uncomplimentary, does so because of the almost entirely fruitless character of their labours. Passing over Adriaan van Roomen (Adrianus Romanus) of Louvain, who published the value of the ratio correct to 15 places in his *Ida mathematica* (1593), we come to the notable computer Ludolph van Ceulen (d. 1610), a native of Germany, long resident in Holland. His book, *Van den Circel* (Delft, 1596), gave the ratio correct to 20 places, but he continued his calculations as long as he lived, and his best result was published on his tombstone in St Peter's church, Liéden. The inscription, which is not known to be now in existence, is in part as follows:—

\[\text{qui in vita sua multo labore circumferentiam circuli maximam rationem ad diametrum inventum sequentem—}
\]

\[\text{quam 3.14159265358979323846264338327920288}
\]

\[\text{et minus}
\]

\[\text{3.14159265358979323846264338327920289}
\]

This gives the ratio correct to 35 places. Van Ceulen's process was essentially identical with that of Vieta. Its numerous root extractions amply justify a stronger expression than "multo labore," especially in an epitaph. In Germany the "Ludolphische Zahl" (Ludolph's number) is still a common name for the ratio.

Up to this point the credit of most that had been done may be set down to Archimedes. A new departure, however, was made by Wilhelm Snell of Leiden in his *Cyclometria*, published in 1621. His achievement was a closely approximate geometrical solution of the problem of rectification (see fig. 9): ACB being a semicircle whose centre is O, and AC the arc to be rectified, he produced AB to D, making BD equal to the radius, joined DC,

![Fig. 9.](image)

and produced it to meet the tangent at A in E; and then his assertion (not established by him) was that AE was nearly equal to the arc AC, the error being in defect. For the purposes of the calculator a solution erring in excess was also required, and this Snell gave by slightly varying the former construction. Instead of producing AB (see fig. 10) so that BD was equal to r, he produced it only so far that, when the extremity D' was joined with C, the part D'F outside the circle was equal to r; in other words, by a non-Euclidean construction he trisected the angle AOC, for it is readily seen that, since FD'=FO=OC, the angle FOB=\(\frac{1}{3}\)AOC. This couplet of constructions is as important from the calculator's point of view as it is interesting geometrically. To compare it on this score with the fundamental proposition of Archimedes, the latter must be put into a form similar to Snell's. AMC being an arc of a circle (see fig. 11) whose centre is O, AC its chord, and HK the tangent drawn at the middle point of the arc and bounded by OA, OC produced, then, according to Archimedes, AMC<HK, but >AC. In modern trigonometrical notation the propositions to be compared stand as follows:—

\[
2\tan\frac{\theta}{2} > 2 \sin\frac{\theta}{2} \quad \text{(Archimedes)}
\]

\[
\tan\frac{\theta}{2} + 2 \sin\frac{\theta}{2} > 3 \sin\frac{\theta}{2} \quad \text{or} \quad 2 - \cos\theta \quad \text{(Snell)}
\]

It is readily shown that the latter gives the best approximation to \(\theta\); but, while the former requires for its application a knowledge of the trigonometrical ratios of only one angle (in other words, the ratios of the sides of only one right-angled triangle), the latter requires the same for two angles, \(\theta\) and \(\frac{\theta}{2}\).

![Fig. 11.](image)

Grienberger, using Snell's method, calculated the ratio correct to 39 fractional places. C. Huygens, in his *De Circuli Magnitudine Involuta*, 1654, proved the propositions of Snell, giving at the same time a number of other interesting theorems, for example, two inequalities which may be written as follows—

\[
\text{ch} \theta + 4 \text{ch} \frac{\theta}{2} + \text{sin} \theta \quad \text{or} \quad 2 \text{ch} \frac{\theta}{2} \text{ch} \frac{\theta}{3} \text{sin} \theta
\]

As might be expected, a fresh view of the matter was taken by René Descartes. The problem he set himself was the exact converse of that of Archimedes. A given straight line being viewed as equal in length to the circumference of a circle, he sought to find the diameter of the circle. His construction is as follows (see fig. 12). Take AB equal to one-fourth of the given line; on AB describe a square ABCD; join AC; in AC produced find, by a known process, a point C such that, when CB is drawn perpendicular to AB produced and CD perpendicular to BC produced, the rectangle BC will be equal to \(\frac{1}{4}\)ABCD; by the same process find a point C such that the rectangle BC will be equal to \(\frac{1}{4}\)BC; and so on ad infinitum. The diameter sought is the straight line from A to the limiting position of the series of B's, say the straight line AB∞. As in the case of the process of Archimedes, it is thus manifest that his first construction Snell gave an approximate solution of two great problems of antiquity.

CIRCLE

Archimedes, we may direct our attention either to the infinite series of geometrical operations or to the corresponding infinite series of arithmetical operations. Denoting the number of units in AB by c, we can express BB, B+B, B+... in terms of c, and the identity $AB_2 = AB + BB_1 + BB_2 + \ldots$ gives us at once an expression for the diameter in terms of the circumference by means of an infinite series. 1 The proof of the correctness of the construction is seen to be involved in the following theorem, which serves likewise to throw new light on the subject: AB being any straight line whatever, and the above construction being made, then AB is the diameter of the circle circumscribed by the square ABCD (self-evident), $AB_1$ is the diameter of the circle circumscribed by the regular 8-gon having the same perimeter as the square, $AB_2$ is the diameter of the circle circumscribed by the regular 16-gon having the same perimeter as the square, and so on. Essentially, therefore, Descartes’s process is that known later as the process of isoperimters, and often attributed wholly to Schwab. 2

In 1655 appeared the Arithmetica Infinitorum of John Wallis, where numerous problems of quadrature are dealt with, the curves being now represented in Cartesian co-ordinates, and algebra playing an important part. In a very curious manner, by viewing the circle $y = (r - x^2)^{1/2}$ as a member of the series of curves $y = (r - x^n)^{1/n}$, etc., he was led to the proposition that four times the reciprocal of the ratio of the circumference to the diameter, i.e. $4\pi$, is equal to the infinite product

$$\frac{3 \cdot 5 \cdot 7 \cdot 9 \cdot \ldots}{2 \cdot 4 \cdot 6 \cdot 8 \cdot \ldots}$$

and, the result having been communicated to Lord Brouncker, the latter discovered the equally curious equivalent continued fraction

$$1 + \frac{1}{1^2 + \frac{2^2}{2^2 + \frac{3^2}{3^2 + \frac{4^2}{4^2 + \ldots}}} \ldots}$$

The work of Wallis had evidently an important influence on the next notable personality in the history of the subject, James Gregory, who lived during the period when the higher algebraic analysis was coming into power, and whose genius helped materially to develop it. He had, however, in a certain sense, once eye fixed on the past and the other towards the future. His first contribution 3 was a variation of the method of Archimedes. The latter, as we know, calculated the perimeters of successive polygons, passing from one polygon to another of double the number of sides; in a similar manner Gregory calculated the areas. The general theories which enabled him to do this, after a start had been made, are

$$A_n = \frac{A_n}{A_n} = \text{Snell’s Cycloid},$$

$$A_n = \frac{2A_n}{A_n + A_n} = \frac{2A_2}{A_2 + A_2},$$

where $A_n, A_n$ are the areas of the inscribed and the circumscribed regular n-gons respectively. He also gave approximate rectifications of circular arcs after the manner of Huygens; and, what is very notable, he made an ingenious and, according to J. E. Montucla, successful attempt to show that quadrature of the circle by a Euclidean construction was impossible. 4 Besides all this, however, and far beyond it in importance, was his use of infinite series. This merit he shares with his contemporaries N. Mercator, Sir I. Newton and G. W. Leibnitz, and the exact dates of discovery are a little uncertain. As far as the circle-squaring functions are concerned, it is well known that Gregory was the first (in 1670) to make known the series for the arc terms of the tangent, the series for the tangent in terms of the arc, and the secant in terms of the arc; and in 1669 Newton showed to Isaac Barrow a little treatise in manuscript containing the series for the arc in terms of the sine, for the sine in terms of the arc, and for the cosine in terms of the arc. These discoveries formed an epoch in the history of mathematics generally, and had, of course, a marked influence on all investigations regarding circle-quadrature. Even among the mere computers the series

$$\theta = \tan \theta = 1 + \tan^2 \theta = \ldots$$

specially known as Gregory’s series, has ever since been a necessity of their calling.

The calculator’s work having now become easier and more mechanical, calculation went on space. In 1690 Abraham Sharp, on the suggestion of Edmund Halley, took Gregory’s series, and, putting $\theta = \pi/3$, found the ratio equal to

$$\sqrt{3} \left(1 + \frac{1}{3} + \frac{1}{5} - \frac{1}{7} - \frac{1}{9} + \ldots\right),$$

which remains long without explanation. 5 Fauret de Lagyn, still using $\pi$, advanced to the 12th place. 6

Leonard Euler took up the subject several times during his life, effecting mainly improvements in the theory of the various series. 7 With him, apparently, began the usage of denoting by $\pi$ the ratio of the circumference to the diameter. 8

The most important publication, however, on the subject in the 18th century was a paper by J. H. Lambert, 9 read before the Berlin Academy in 1761, in which he demonstrated the irrationality of $\pi$. The general test of irrationality which he established is that, if

$$\frac{a_1}{b_1} \frac{a_2}{b_2} \cdots \frac{a_n}{b_n}$$

be an intermediate continued fraction, $a_1, a_2, \ldots, b_1, b_2 \ldots$ be integers, $a_i/b_i, a_j/b_j \ldots$ be proper fractions, and the value of every one of the intermediate continued fractions $\frac{a_i}{b_i}, \ldots$, be $< 1$, then the given continued fraction represents an irrational quantity. If this be applied to the right-hand side of the identity

$$\tan \frac{\pi}{n} = \frac{m}{n} \frac{m^2}{n^2} \frac{m^2}{n^3} \ldots$$

it follows that the tangent of every arc commensurable with the radius is irrational, so that, as a particular case, an arc of 45°, having its tangent rational, must be incommensurable with the radius; that is to say, $\pi/4$ is an incommensurable number. 10

This incontestable result had no effect, apparently, in expressing the $\pi$-computers. G. von Vega in 1789, using series like Machin’s, viz. Gregory’s series and the identities

$$\pi/4 = 5 \tan^{-1} 2 + 2 \tan^{-1} 2, \quad \pi/4 = 5 \tan^{-1} 2 \tan^{-1} 2, \quad \pi/4 = 5 \tan^{-1} 2 \tan^{-1} 2$$

Hutton, Tracts, i, 296,

neither of which was nearly so advantageous as several found by Charles Hutton, calculated $\pi$ correct to 136 places. 11 This achievement was not calculated or discovered by any unknown calculator, whose manuscript was seen in the Radcliffe Library, Oxford, by Baron von Zach towards the end of the century, and contained the ratio correct to 152 places. More astonishing still have been the deeds of the $\pi$ computers of the 19th century.

By these computers Machin's identity, or identities analogous to it, e.g. 
\[
\pi \approx \tan^{-1} 1 + \tan^{-1} \frac{1}{2} + \tan^{-1} \frac{\sqrt{3}}{2} = (\text{Dase, 1844}), \\
\pi \approx \tan^{-1} 1 + \tan^{-1} \frac{1}{3} - \tan^{-1} \frac{1}{12} \text{ (Rutherford).}
\]

and Gregory's series were employed. ¹

A much less clear than the π-computers of modern times are the pseudo-circle-squares, or circle-squares technically so called, that is to say, persons who, having obtained by illegitimate means a Euclidean construction for the quadrature or a finitely expressible value for π, insist on using faulty reasoning and defective mathematics to establish their assertions. Such persons have flourished at all times in the history of mathematics; but the interest attaching to them is more psychological than mathematical.³

It is of recent years that the most important advances in the theory of circle-quadrate have been made. In 1873, Charles Hermite proved that the base e of the Napierian logarithms cannot be a root of a rational algebraic equation of any degree. To prove the same proposition regarding π is to prove that a Euclidean construction for circle-quadrate is impossible. For in such a construction every point of the figure is obtained by the intersection of two straight lines, a straight line and a circle, or two circles; and as this implies that, when a unit of length is introduced, numbers employed, and the problem transformed into one of algebraic geometry, the equations to be solved can only be of the first or second degree, it follows that the equation to which we must be finally reduced is a transcendental equation of even degree. Hermite did not succeed in his attempt upon π, but in 1880 F. Lindemann, following exactly in Hermite's steps, accomplished the desired result.⁴ (See also TRIGONOMETRY.)

CIRCLEVILLE, a city and the county-seat of Pickaway county, Ohio, U.S.A., about 26 m. S. by E. of Columbus, on the Scioto river and the Ohio Canal. Pop. (1890) 6565; (1900) 6901 (551 negroes); (1910) 6744. It is served by the Cincinnati & Muskingum Valley (Pennsylvania lines) and the Norfolk & Western railways, and by the Scioto Valley electric line. CIRCLEVILLE is situated in a farming region, and its leading industries are the manufacture of straw boards and agricultural implements, and the canning of sweet corn and other produce. The city occupies the site of prehistoric earth-works, from one of which, built in the form of a circle, it derived its name. CIRCLEVILLE, first settled about 1806, was chosen as the county-seat in 1810. The court-house was built in the form of an octagon at the centre of the circle, and circular streets were laid out around it; but this arrangement proved to be inconvenient, the court-house was destroyed by fire in 1841, and at present no trace of the ancient landmarks remains. CIRCLEVILLE was incorporated as a village in 1814, and was chartered as a city in 1853.

CIRCUIT (Lat. circuitus, from circum, round, and ire, to go), the act of moving round; so circumference, or anything encircling or encircled. The word is particularly known as a law term, signifying the periodical progress of a legal tribunal for the purpose of carrying out the administration of the law in the several provinces of a country. It has long been applied to the journey or progress which the judges have been in the habit of making through the several counties of England, to hold courts and administer justice, where recourse could not be had to the king's court at Westminster (see ASIZE). In England, by sect. vii. of the Circumference Act 1875, power was conferred on the crown, by order in council, to make regulations respecting circuits, including the discontinuance of any circuit, and the formation of any new circuit, and the appointment of the place at which assizes are to be held on any circuit. Under this power an order of council, dated the 5th of February 1876, was made, whereby the circuit system was remodelled. A new circuit, called the North-Eastern circuit, was created, consisting of Newcastle and Durham taken out of the old Northern circuit, and York and Leeds taken out of the Midland circuit. The Norfolk circuit was divided, consisting of Huntingdon, Cambridge, Ipswich, Norwich, Chelmsford, Hertford and Lewes, taken partly out of the old Norfolk circuit and partly out of the Home circuit. The counties of Kent and Surrey were left out of the circuit system, the assizes for these counties being held by the judges remaining in London. Subsequently Maidstone and Guildford were united under the revived name of the Home circuit for the purpose of the summer and winter assizes, and the assizes in these towns are held by one of the judges of the Western circuit, who, after disposing of the business there, rejoins his colleague in Exeter. In 1890 this arrangement was abolished, and Maidstone and Guildford were added to the South-Eastern circuit. Other minor changes in the assize towns were made, which it is unnecessary to particularize. Birmingham first became a circuit town in the year 1844, and the work there became, by arrangement, the joint property of the Midland and Oxford circuits. There are alternative assize towns in the following counties, viz.—On the Western circuit, Salisbury and Devizes for Wiltshire, and Wells and Taunton for Somerset; on the South-Eastern, Ipswich and Bury St Edmunds for Suffolk, on the North Wales circuit, Welsbhop and Newtown for Montgomery; and on the South Wales circuit, Cardiff and Swansea for Glamorgan.

According to the arrangements in force in 1909 there are four assizes in each year. There are two principal assizes, viz. the winter assizes, beginning in January, and the summer assizes, beginning at the end of May. At these two assizes criminal and civil business is disposed of in all the circuits. There are two other assizes, viz. the autumn assizes and the Easter assizes. The autumn assizes are regulated by sect. 4 of an Act 1876 and 1877 (Winter Assizes Acts 1876 and 1877), and orders of council made under the former act. They are held for the whole of England and Wales, but for the purpose of these assizes the work is to a large extent "grouped," so that not every county has a separate assize. For example, on the South-Eastern circuit Huntington
CIRCUIT

is grouped with Cambridge; on the midland, Rutland is grouped with Lincoln; on the Northern, Westmorland is grouped with Cumberland; and the North West and South Wales circuits are united, and no assizes are held at some of the smaller towns. At these assizes criminal business only is taken, except at Manchester, Liverpool, Swansea, Birmingham and Leeds. The Easter assizes are held in April and May on two circuits only, viz. at Manchester and Liverpool on the Northern and at Leeds on the North-Eastern. Both civil and criminal business is taken at Manchester and Liverpool, but criminal business only at Leeds.

Other changes were made, with a view to preventing the complete interruption of the London sittings in the common law division by the absence of the judges on circuit. The assizes were so arranged as to commence on different dates in the various circuits. For example, the summer assizes begin in the South-Eastern and Western circuits on the 29th of May; in the Northern circuit on the 28th of June; in the Midland and Oxford circuits on the 16th of June; in the North-Eastern circuit on the 6th of July; in the North Wales circuit on the 7th of July; and in the South Wales circuit on the 11th of July. There has been a continuous circuit at Liverpool for some years, and a single judge circuit at Swansea. In the early days of the new order, the members of the court of appeal and the judges of the chancery division shared the work of the judges in the common law division. This did not prove to be a satisfactory arrangement. The assize work was not familiar and was congenial to the chancery judges, who had not the training or experience to fix them for it. Arrears increased in chancery, and the appeal court was shorn of much of its strength for a considerable part of the year. The practice was discontinued in or about the year 1884. The appeal and chancery judges were relieved of the duty of going on circuit, and an arrangement was made by the treasury for making an allowance for expenses of circuit to the common law judges, on whom the whole work of the assizes was thrown. In order to cope with the assize work, and at the same time keep the common law sittings going in London, an experiment, which had been previously tried by Lord Cairns and Lord Cross (then home secretary) and discontinued, was revived. Instead of two judges going together to each assize circuit, it was arranged that judges be sent to certain selected places—practically, it may be said, to all except the more important provincial centres. The only places to which two judges now go are Exeter, Winchester, Bristol, Manchester, Liverpool, Nottingham, Stafford, Birmingham, Newcastle, Durham, York, Leeds, Chester, and Cardiff or Swansea.

It could scarcely be said that, even with the amendments introduced under orders in council, the circuit system was altogether satisfactory or that the last word had been pronounced on the subject. In the first report of the Judicature Commission, dated March 25th, 1869, p. 17 (Parl. Papers, 1868-1869), the majority report that “the necessity for holding assizes in every county without regard to the extent of the business to be transacted in such county leads, in our judgment, to a great waste of judicial strength and a great loss of time in going from one circuit town to another, and causes much unnecessary cost and inconvenience to those whose attendance is necessary or customary at the assizes.” And in their second report, dated July 8th, 1873 (Parl. Papers, 1872, vol. xx.), they dwell upon the advisability of grouping or a discontinuance of holding assizes “in several counties, for example, Rutland and Westmorland, where it is manifestly an idle waste of time and money to have assizes.” It is thought that the grouping of counties which has been effected for the autumn assizes might be carried still further and applied to all the assizes; and that the system of holding the assizes alternately in one of two towns with a county might be extended to two towns in adjoining counties, for example, Gloucester and Worcester. The facility of railway communication renders this reform comparatively easy, and reforms in this direction have been approved by the judges, but ancient custom and local patriotism, interests, or susceptibility bar the way. The Assizes and Quarter Sessions Act 1898 contributed something to a reform by dispensing with the obligation to hold assizes at a fixed date if there is no business to be transacted. Nor can it be said that the single-judge system has been altogether a success. When there is only one judge for both civil and criminal work, he properly takes the criminal business first. He can fix only approximately the time when he can hope to be free for the civil business. If the calendar is exceptionally heavy or one or more of the criminal cases prove to be unexpectedly long (as may easily happen), the civil business necessarily gets squeezed into the short residue of the allotted time. Suits and their solicitors and witnesses are kept waiting for days, and after all perhaps it proves to be impossible for the judge to take the case, and a “remnant” is the result. It is the opinion of persons of experience that the result has undoubtedly been to drive to London much of the civil business which properly belongs to the provinces, and ought to be tried there, and thus at once to increase the burden on the judges and juries in London, and to increase the costs of the trial of the actions sent there. Some persons advocate the continuous sittings of the high court in certain centres, such as Manchester, Liverpool, Leeds, Newcastle, Birmingham and Bristol, or in fact a centralization of the judicial system. There is already an excellent court for chancery cases for Lancashire in the county palatine court, presided over by the vice-chancellor, and with a bar which has produced many men of great ability and even eminence. The Durham chancery court is also capable of development. Another suggestion has been made for continuous circuits throughout the legal year, so that a certain number of the judges, according to a rota, should be continuously in the provinces while the remaining judges did the London business. The value of this suggestion would depend on an estimate of the number of cases which might thus be tried in the country in relief of the London list. This estimate it would be difficult to make. The opinion has also been expressed that it is essential in any changes that may be made to retain the occasional administration by judges of the high court of criminal jurisdiction, both in populous centres and in remote places. It promotes a belief in the importance and dignity of justice and the cure to be given to all matters affecting a citizen’s life, the basis of which is laid in the judiciaries of the 14th century. The centralization of the judicial system is therefore undesirable. It is not possible. But in the absence of any provision for doing the work at less cost, the only chance for doing it at all is the retention of the existing multi-judge circuits with the single-judge circuits. A better system is that of a circuit with a single judge for civil work and a multi-judge court for criminal work.
nine judicial circuits, divided as follows: 1st circuit, Maine, Massachusetts, New Hampshire, Rhode Island; and circuit, Connecticut, New York, Vermont; 2nd circuit, Delaware, New Jersey, Pennsylvania; 4th circuit, Maryland, North Carolina, South Carolina, Virginia, West Virginia; 5th circuit, Alabama, Florida, Georgia, Louisiana, Mississippi, Texas; 6th circuit, Kentucky, Michigan, Ohio, Tennessee; 7th circuit, Illinois, Indiana, Wisconsin; 8th circuit, Arkansas, Colorado, Oklahoma, Iowa, Kansas, Minnesota, Missouri, Nebraska, New Mexico, North Dakota, South Dakota, Utah, Wyoming; 9th circuit, Alaska, Arizona, California, Idaho, Montana, Nevada, Oregon, Washington, and Hawaii. A circuit court of appeals is made up of three judges of the circuit court, the judges of the district courts of the circuit, and the judge of the Supreme Court allotted to the circuit.

In Scotland the Judges of the supreme criminal court, or high court of justice, form also three separate circuit courts, consisting of two judges each; and the country, with the exception of the Lothians, is divided into corresponding districts, called the Northern, Western and Southern circuits. On the Northern circuits are the Inverness, Perambulation and Aberdeen; on the Western, the Glasgow, Stirling, and Invicray; and on the Southern, at Dumfries, Jedburgh and Ayr.

Ireland is divided into the North-East and the North-West circuits, and those of Leinster, Connaught and Munster.

**CIRCULAR NOTE,** a documentary request by a bank to its foreign correspondents to pay a specified sum of money to a named person. The person in whose favour a circular note is issued is furnished with a letter (containing the signature of an official of the bank and the person named) called a letter of indication, which is usually referred to in the circular note, and must be produced on presentation of the note. Circular notes are generally issued against a payment of cash to the amount of the notes, but the notes need not necessarily be cashed, but may be returned to the banker in exchange for the amount for which they were originally issued. A forged signature on a circular note conveys no right, and as it is the duty of the payer to see that payment is made to the proper person, he cannot recover the amount of a forged note from the banker who issued the note. (See also LETTER OF CREDIT.)

**CIRCULAR IN PROBANDO** (Lat. for “circle in proving”), in logic, a phrase used to describe a form of argument in which the very fact which one seeks to demonstrate is used as a premise, i.e. as part of the evidence on which the conclusion is based. This argument is one form of the fallacy known as *petitio principii*, “begging the question.” It is most common in lengthy arguments, the complicated character of which enables the speaker to make his hearers forget the data from which he began. (See FALLACY.)

**CIRCUMCISION** (Lat. *circuitum*), to cut), the cutting off of the foreskin. This surgical operation, which is commonly prescribed for purely medical reasons, is also an initiation or religious ceremony among Jews and Mahomedans, and is a widespread institution in many Semitic races. It remains, with Jews, a necessary preliminary to the admission of proselytes, except in some Reformed communities. The origin of the rite among the Jews is in Genesis (xxvii.) placed in the age of Abraham, and at all events it must have been very ancient, for flint knives were used in the operation (Exodus iv. 25; Joshua vii. 2). The narrative in Exodus is silent on the precise way in which the custom was introduced by him, but not that it had merely been in abeyance in the Wilderness. At Gilgal it was “rolled away the reproach of the Egyptians” by circumcising the people. This obviously means that whereas the Egyptians practised circumcision the Jews in the land of the Pharaohs did not, and hence were regarded with contempt. It was an old theory (Herodotus ii. 36) that circumcision originated in Egypt; at all events it was practised in that country in ancient times (Ebers, *Egyptien und die Bücher Mosis*, i. 278-284), and the same is true at the present day. But it is not generally thought probable that the Hebrews derived the rite directly from the Egyptians. As Driver puts it (Genesis, p. 190): “It is possible that, as Dillmann and Nowack suppose, the peoples of N. Africa and Asia who practised the rite adopted it from the Egyptians, but it appears in so many parts of the world that it must at any rate in these cases have originated independently.” In another biblical narrative (Exodus iv. 25) Moses is subject to the divine anger because he had not made himself “a bridegroom of blood,” that is, had not been circumcised before his marriage.

The rite of circumcision was practised by all the inhabitants of Palestine with the exception of the Philistines. It was an ancient custom among the Arabs, being presupposed in the Koran. The only important Semitic peoples who most probably did not follow the rite were the Babylonians and Assyrians (Sayce, *Babyl. and Assyrians*, p. 47). Modern investigations have brought to light many instances of the prevalence of circumcision in various parts of the world. These facts are collected by André and Ploss, and go to prove that the rite is not only spread through the Mahomedan world (Turks, Persians, Arabs, &c.), but also is practised by the Christian Abyssinians and the Copts, as well as in central Australia and in America. In central Australia (Spencer and Gillen, pp. 212-386) circumcision with a stone knife must be undergone by every youth before he is reckoned a full member of the tribe, and the ceremony is performed on the married state. In other parts, too (e.g., New Guinea, north, and south), uncircumcised men may marry. Circumcision was known to the native races of Australia, *Native Races*, vol. iii.), and is still practised by the Caribs of the Orinoco and the Tacunas of the Amazon. The method and period of the operation vary in important particulars. Among the Jews it is performed in infancy, when the male child is eight days old. The child is named at the same time, and the ceremony is elaborate. The child is carried to the godfather (Sandez, a hebraized form of the Gr. ἱερευς, “godfather,” post-class.), who places the child on a cushion, which he holds on his knees throughout the ceremony. The operator (mohel) uses a steel knife, and pronounces various blessing ceremonies before and after the rite is performed (see S. Singer, *Authorised Daily Prayer Book*, pp. 304-307; an excellent account of the domestic festivities and spiritual joys associated with the ceremony among medieval and modern Jews may be read in S. Schechter’s *Studies in Judaism*, first series, pp. 351 seq.). Some tribes in South America and elsewhere are said to perform the rite on the eighth day, like some Jews. The Mazequas do it between the first and second months. Among the Bantus the rite is performed on children of three years, amid dances and the selection of bridegrooms (Doughty, *Arabia Deserta*, i. 340); among the Somalis the age is seven (Reinisch, *Somalisprache*, p. 110). But for the most part the tribes who perform the rite carry it out at the age of puberty. Many facts bearing on this point are given by B. Stade in *Zeitschrift für die alttest. Wissenschaft*, vi. (1886) pp. 132 seq.

The significance of the rite of circumcision has been much disputed. Some see in it a tribal badge. If this be the true origin of circumcision, it must go back to the time when men went about naked. Mutilations (tattooing, removal of teeth and so forth) were tribal marks, being partly sacrificial and partly means of recognition (see MUTILATION). Such initiatory rites were often frightful ordeals, in which the neophyte’s courage was severely tested (Robertson Smith, *Religion of the Semites*, p. 310). Some regard circumcision as a substitute for far more serious rites, including even human sacrifice. Utilitarian explanations have also been suggested. Sir R. Burton (Memoirs of the *Nap. Soc.* i. 318) held that it was introduced to promote fertility, and the custom has been put forward (following Philo’s example, see ed. Mangnusen, p. 316). Most probably, however, circumcision (which in many tribes is performed on both sexes) was connected with marriage, and was a preparation for connubium. It was in Robertson Smith’s words “originally a preliminary to marriage, and so a ceremony of introduction to the full prerogative of manhood,” the transference to infancy among the Jews being a later change. On this view, the decisive Biblical reference would be the Exodus passage (iv. 25), in which Moses is represented as being in danger of his life because he had neglected the proper preliminary to marriage. In Genesis, on the other hand, circumcision is an
CIRCUMVALLATION—CIRCUS

external sign of God's covenant with Israel, and later Judaism
now regards it in this symbolic sense. Barton (Semitic Origins, p. 100) declares that "the circumstances under which it is per-
formed in Arabia point to the origin of circumcision as a sacri-
fice to the goddess of fertility, by which the child was placed under
her protection and its reproductive powers consecrated to her
service." But Barton admits that initiation to the connubium
was the primitive origin of the rite.

As regards the non-ritual use of male circumcision, it may be
added that in recent years the medical profession has been
responsible for its considerable extension among other than
Jewish children, the operation being recommended not merely in
cases of malformation, but generally for reasons of health.

Authorities.—On the present diffusion of circumcision see H.
Ploss, Das Kind im Brauch und Sitte der Völker, i. 342 seq., and his
researches in Deutsches Archiv für Geschichte der Medizin, viii.
312-344; Andrees, "Die Beschneidung" in Archiv für Anthropo-
logie, xiii. 76; and Spencer and Gillen, Tribes of Central Australia.
The articles in the Encyclopedia Biblica and Dictionary of the Bible
contain useful bibliographies as well as historical accounts of the
rite and its ceremonies, especially as concerns the Jews. The Jewish
Encyclopedia in particular gives an extensive list of books on the
Jewish customs connected with circumcision, and the various articles
in that work are full of valuable information (vol. iv. pp. 92-102).

1. In Roman antiquities the circus was a building for the
exhibition of horse and chariot races and other amusements.
It consisted of tiers of seats, the lowest row being called
the palaestrae, and the seats beyond, the grand stand, and
forming a crescent round one of the ends. The
other end was straight and at right angles to the course, so
that the plan of the whole had nearly the form of an ellipse cut
in half at its vertical axis. Along the transverse axis ran a fence
(spinx) separating the return course from the starting one. The
straights end had no seats, but was occupied by the stalls (carceres)
where the chariots and horses were kept in readiness. This end
constituted also the front of the building with the main entrance.
At each end of the course were three conical pillars (metæ) to
mark its limits.

The oldest building of this kind in Rome was the Circus
Maximus, in the valley between the Palatine and Aventine
hills, where, before the erection of any permanent structure, races
appear to have been held beside the altar of the god
Census. The first building is assigned to Tarquin the younger,
but for a long time little seems to have been done to complete
its accommodation, since it is not till 319 B.C. that we hear
of stalls being erected for the chariots and horses. It was not
in fact until the second or third century that the circus became a consecrated
public resort. Caesar enlarged it to some extent, and also made
a canal 10 ft. broad between the lowest tier of seats (podium)
and the course as a precaution for the spectators' safety when exhibitions of fighting with wild beasts, such as were afterwards
confined to the amphitheatre, took place. When these exhibitions
were removed, and the canal (eupirus) was no longer
necessary, Nero had it filled up. Augustus is said to have placed
an obelisk on the spinx between the metæ, and to have built a
new pulvinar, or imperial box; but if this is taken in connexion
with the fact that the circus had been partially destroyed by
fire in 31 B.C., it may be supposed that besides this he had
restored it altogether. Only the lower tiers of seats were of
stone, the others being of wood, and this, from the liability to
fire, may account for the frequent restorations to which the circus
was subject; it would also explain the falling of the seats by
which a crowd of people were killed in the time of Antoninus
Pius. In the reign of Claudius, apparently after a fire, the
carceres of stone (tufa) were replaced by marble, and the metæ of
wood by gilt bronze. Under Domitian, again, after a fire, the
circus was rebuilt and the carceres increased to 12 instead of
8 as before. The work was finished by Trajan. See further for

The circus was the only public spectacle at which men and
women were not separated. The lower seats were reserved for
persons of rank; there were also various state boxes, e.g. for
the giver of the games and his friends (called cubicula or suggestus).
The principal object of attraction apart from the racing must
have been the spinx or low wall which ran down the middle
of the course, with its obelisks, images and ornamental shrines.
On it also were seven figures of dolphins and seven oval objects,
one of which was taken down at every round made in a race,
so that spectators might see readily how the contest proceeded.
On the upper race there were seven round ovals of the course.
The chariots started abreast, but in an oblique line, so that the outer
chariot might be compensated for the wider circle it had to make
at the other end. Such a race was called a missus, and as many
as 24 of these would take place in a day. The competitors
were different colours, originally white and red (albata and
russata), to which green (prasia) and blue (teneta) were added.
Domitian introduced two more colours, gold and purple (pur-
pureus et auratus pannus), which probably fell into disuse after
his death. To provide the horses and large staff of attendants
it was necessary to apply to rich capitalists and owners of studs,
and from this there grew up in time four select companies (factiones)
of circus purveyors, which were identified with the four colours,
and with which those who organized the races had to contract for the proper supply of horses and men. The drivers
(aurigae, agilatores), who were mostly slaves, were sometimes
held in high repute for their skill, although their calling was
regarded with contempt. The horses most valued were those of
Sicily, Spain and Cappadocia, and great care was taken in train-
ing them. Chariots with two horses (bigiae) or four (sibiagi)
were most common, but sometimes also they had three (trigia),
and exceptionally more than four horses. Occasionally there
was combined with the chariots a race of riders (desulatores),
each rider having two horses and leaping from one to the other
during the race. At certain of the races the proceedings were
opened by a pompa or procession in which images of the gods
and of the imperial family deified were conveyed in cars drawn
by horses, mules or elephants, attended by the colleges of priests,
and led by the presiding magistrate (in some cases by the
emperor himself) seated in a chariot in the dress and with the
insignia of a triumphator. The procession passed from the
capitol along the forum, and on to the circus, where it was re-
ceived by the people standing and clapping their hands. The
presiding magistrate gave the signal for the races by throwing a
white flag (mappe) on to the course.

Next in importance to the Circus Maximus in Rome was the
Circus Flamininus, erected 221 B.C., in the censorship of C.
Flaminius, from whom it may have taken its name; or the
name may have been derived from Prata Flaminia, where it
was situated, and where also were held plebeian meetings.
The only games that are positively known to have been celebrated
in this circus were the Ludi Taurii and Plebei. There is no
mention of it after the 1st century. Its ruins were identified in
the 16th century at S. Caterina dei Funari and the Palazzo
Mattei.

A third circus in Rome was erected by Caligula in the gardens
of Agrippina, and was known as the Circus Neornis, from the
notoriety which it obtained through the Circensian pleasures
of Nero. A fourth was constructed by Maxentius outside the
Porta Appia near the tomb of Caecilia Metella, where its ruins
are still, and now afford the only instance from which an idea of the ancient circi in Rome can be obtained. It was traced to Caracalla, till the discovery of an inscription in 1825 showed it to be the work of Maxentius. Old topographers speak of six circi, but two of these appear to be imaginary, the Circus Florae and the Circus Sallustii.

Circus races were held in connexion with the following public festivals, and generally on the last day of the festival, if it extended over more than one day—(1) The Consualia, August 21st, December 15th; (2) Equitaria, February 27th, March 14th; (3) Ludi Romani, September 4th-10th; (4) Ludi Plebei, November 4th-17th; (5) Cirialis, April 12th-19th; (6) Ludi Apollinares, July 6th-13th; (7) Ludi Megalenses, April 4th-10th; (8) Floralia, April 28th-May 3rd.

(2nd ed., 1885), p. 504. For existing remains see works quoted under Roman Archaeology.

2. The Modern Circus.—The "circus" in modern times is a form of popular entertainment which has little in common with the institution of classical Rome. It is frequently nomadic in character, the place of the permanent building known to the ancients as the circus being taken by a tent, which is carried from place to place and set up temporarily on any site procurable at country fairs or in provincial towns, and in which spectacular performances are given by a troupe employed by the proprietor. The centre of the tent forms an arena arranged as a horse-ring, swan with tan or other soft substance, where the performances take place, the seats of the spectators being arranged in ascending tiers around the central space as in the Roman circus. The traditional type of exhibition in the modern travelling circus consists of feats of horsemanship, such as leaping through hoops from the back of a galloping horse, standing on one foot on each, or galloping side by side, turning somersaults from a springboard over a number of horses standing close together, or accomplishing acrobatic tricks on horseback. These performances, by male and female riders, are varied by the introduction of horses trained to perform tricks, and by drolleries on the part of the clown, whose place in the circus is as firmly established by tradition as in the pantomime.

The popularity of the circus in England may be traced to that kept by Philip Astley (d. 1814) in London at the end of the 18th century. Astley was followed by Ducrow, whose feats of horsemanship had much to do with establishing the traditions of the circus, which were perpetuated by Hengler's and Sanger's celebrated shows in a later generation. In America a circus-actor named Ricketts is said to have performed before George Washington in 1780, and in the first half of the 19th century the establishments of Purdy, Welch & Co., and of van Amburgh gave a wide popularity to the circus in the United States. All former circuses were, however, far surpassed in enterprise and resource by P. T. Barnum (1810-1891), whose claim to be the possessor of "the greatest show on earth" was no exaggeration. The influence of Barnum, however, brought about a considerable change in the character of the modern circus. In arenas too large for speech to be easily audible, the traditional comic dialogue of the clown assumed a less prominent place than formerly, while the vastly increased wealth of stage properties relegated to the background the old-fashioned equestrian feats, which were replaced by more ambitious acrobatic performances, and by exhibitions of skill, strength and daring, requiring the employment of immense numbers of performers and often of complicated and expensive machinery. These tendencies are, as is natural, most marked in shows given in permanent buildings in large cities, such as the London Hippodrome, which was built as a combination of the circus, the menagerie and the variety theatre. The wild animals, such as lions and elephants from time to time appeared in the ring, and where conditions of nature such as floods, earthquakes and volcanic eruptions have been produced with an extraordinary wealth of realistic display. At the Hippodrome in Paris—unlike its London namesake, a circus of the true classical type in which the arena is entirely surrounded by the seats of the spectators—chariot races after the Roman model were held in the latter part of the 19th century, at which prizes of considerable value were given by the management.

CIRENCESTER (traditionally pronounced Cicete), a market town in the Cirencester parliamentary division of Gloucestershire, England, on the river Churn, a tributary of the Thames, 93 m. W.N.W. of London. Pop. of urban district (1901) 7356. It is served by a branch of the Great Western railway, and there is also a station on the Midland and South-Western Junction railway. This is an ancient and prosperous market town of picturesque old houses clustering round a fine parish church, with a high embattled tower, and a remarkable south porch with parvise. The church is mainly Perpendicular, and among its numerous chapels that of St Catherine has a beautiful roof of fan-tracery in stone dated 1508. Of the abbey founded in 1117 by Henry I. there remain a Norman gateway and a few fragments. There are two good museums containing mosaics, inscriptions, carved and sculptured stones, and many smaller remains, for the town was the Roman Corinium Dobunorum. Little trace of Corinium, however, can be seen in situ, except the amphitheatre and some indications of the walls.

To the west of the town is Cirencester House, the seat of Earl Bathurst. The first Lord Bathurst (1684-1775) devoted himself to beautifying the fine demesne of Oakley Park, which he planted and adorned with remarkable artificial ruins. This nobleman, who became baron in 1711 and earl in 1772, was a patron of art and literature no less than a statesman; and Pope, a frequent visitor here, was allowed to design the building known as Pope's Seat, in the park, commanding a splendid prospect of woods and avenues. Swift was another appreciative visitor. The house contains portraits by Lawrence, Gainsborough, Romney, Lely, Reynolds, Hoppner, Kneller and many others. A mile west of the town is the Royal Agricultural College, incorporated by charter in 1845. Its buildings include a chapel, a dining hall, a library, a lecture theatre, laboratories, class-rooms, private studies and dormitories for the students, apartments for resident professors, and servants' offices; also a museum containing a collection of anatomical and pathological preparations, and mineralogical, botanical and geological specimens. The college farm comprises 500 acres, 450 of which are arable; and on it are the well-appointed farm-buildings and the veterinary hospital. Besides agriculture, the course of instruction at the college includes chemistry, natural and mechanical philosophy, natural history, mensuration, surveying and drawing, and other subjects of practical importance to the farmer, proficiency in which is tested by means of sessional examinations. The industries of Cirencester comprise various branches of agriculture. It has connexion by a branch canal with the Thames and Severn canal.

Corinium was a flourishing Romano-British town, at first perhaps a cavalry post, but afterwards, for the greater part of the Roman period, a settlement of civilians. As a town, Cirencester (Cirencecester, Cirencester, Cyriencester) is described in Domesday as ancient demesne of the crown. The manor was granted by William I. to William Fitzosborn; on reverting to the crown it was given in 1180, with the township, to the Augustinian abbey founded here by Henry I. The struggle of the townsmen to prove that Cirencester was a borough probably began in the same year, when they were acentered for a false presentation. Four inquisitions during the 13th century supported the abbot's claims, yet in 1343 the townsmen declared in a chancery bill of complaint that Cirencester was a borough distinct from the manor, belonging to the king but usurped by the abbot, who since 1308 had abated their court of provosty. Accordingly they produced a copy of a forged charter from Henry I. to the town; the court ignored this and the abbot obtained a new charter and a writ of supersedeas. For their success against the earls of Kent and Salisbury Henry IV. in 1402 gave the townsmen a guild merchant, although two
inquisitions reiterat[ed] the rabbït's rights. These were confirmed in 1408-1469 and 1413; in 1418 the charter was annulled, and in 1424 parliament declared that Circeo was not corporate. After several unsuccessful attempts to re-establish the gild merchant, the government in 1592 was vested in the bailiff of the lord of the manor. Circeo became a parliamentary borough in 1572, returning two members, but was deprived of representation in 1885. Besides the "new market" of Domessac Book the abbots obtained charters in 1215 and 1253 for fairs during the octaves of All Saints and St Thomas the Martyr. The wool trade gave these great importance; in 1341 there were ten wool merchants in Circeo, and Leuland speaks of the abbots' cloth-mill, while Camden calls it the greatest market for wool in England.

CIRILLO, DOMENICO (1739-1796). Italian physician and patriot, was born at Grumo in the kingdom of Naples. Appointed while yet a young man to a botanical professorship, Cirillo went some years afterwards to England, where he was elected fellow of the Royal Society, and to France. On his return to Naples he was appointed successively to the chairs of practical and theoretical medicine. He wrote voluminously and well on scientific subjects and secured an extensive medical practice. On the French occupation of Naples and the proclamation of the Parthenopean republic (1799), Cirillo, after at first refusing to take part in the new government, consented to be chosen a representative of the people and became a member of the legislative commission, of which he was eventually elected president. On the abandonment of the republic by the French (June 1799), Cardinal Ruffo and the army of King Ferdinand IV. returned to Naples, and the Republicans withdrew, ill-armed and inadequately provisioned, to the forts. After a short siege they surrendered on honourable terms, life and liberty being guaranteed them by the signatures of Ruffo, of Fotteo, and of Michielous. But the arrival of Nelson changed the complexion of affairs, and he refused to ratify the capitulation. Secure under the British flag, Ferdinand and his wife, Caroline of Austria, showed themselves eager for revenge, and Cirillo was involved with the other republicans in the vengeance of the royal family. He asked Lady Hamilton (wife of the British minister to Naples) to intercede on his behalf, but Nelson wrote in reference to the petition: "Domenico Cirillo, who had been the king's physician, might have been saved, but that he chose to play the fool and lie, denying that he had ever made any speeches against the government, and saying that he only took care of the poor in the hospitals" (Nelson and the Neapolitan Jacobins, Navy Records Society, 1903). He was condemned and hanged on the 29th of October 1799. Cirillo, whose favourite study was botany, and who was recognized as an entomologist by Linnaeus, left many books, in Latin and Italian, all of them treating of medical and scientific subjects, and all of little value now. Exception must, however, be made in favour of the Virtù morali dell' Aosta, a pleasant philosophical pamphlet, remarkable for its double charm of sense and style. He introduced many medical innovations into Naples, particularly inoculation for smallpox.

See C. Giglioli, Naples in 1799 (London, 1903); L. Conforti, Napoli nel 1799 (Naples, 1899); C. Tavaroni, L'Italia durante il dominio francese, vol. ii. pp. 179-204. Also under NAPLES; NELSON and FERDINAND IV. OF NAPLES.

CIRQUE (Lat. circus, ring), a French word used in physical geography to denote a semicircular crater-like amphitheatre at the head of a valley, or in the side of a glaciated mountain. The valley cirque is characteristic of calcareous districts. In the Chiltern Hills especially, and generally along the chalk escarpments, a flat-bottomed valley with an intermittent stream winds into the hill and ends suddenly in a cirque. There is an excellent example at Ivinghoe, Buckinghamshire, where it appears as though an enormous flat-bottomed scoop had been driven into the hillsidc and dragged outwards to the plain. In all cases it is found that the valley floor consists of hard or impervious rock above which lies a permeable or soluble stratum of considerable thickness. In the case of the chalk hills the upper strata are very porous, and the descending water with atmospheric and Humous acids in solution has great solvent power. During the winter this upper layer becomes saturated and some of the water drains away along joints in the escarpment. An underground stream is thus developed carrying away a great deal of material in solution, and in consequence the ground above slowly collapses over the stream, while the cirque at the head, where the stream issues, gradually works backward and may pass completely through the hills, leaving a gap of which another drainage system may take possession. In the limestone country of the Cottewold Hills, many small intermittent tributary streams are headed by cirques, and some of the longer dry valleys have springs issuing from beneath their lower ends, the dry valleys being collapsed areas above underground streams not yet revealed. In this case the pervious limestone is underlain by beds of impervious clay. There are many of these in the Jura Mountains. The Cirque de St Sulpice is a fine example where the impervious bed is a marly clay.

The origin of the glacial cirque is entirely different and is said by W. D. Johnson (Journal of Geology, xii. No. 7, 1904) to be due to basal sapping and erosion under the bergschrund of the glacier. In this he is supported by G. K. Gilbert in the same journal, who produces some remarkable examples from the Sierra Nevada in California, where the mountain fragments have been left behind "like a sheet of dough upon a board after the biscuit tin has done its work"; so that above the head of the glaciers "the rock detail is rugged and splintered but its general effect is that of a great symmetrical arc." Descending one of the bergschrunds of Mt. Lyell to a depth of 150 ft., Johnson found a rock floor cemented with ice and blocks of rock and the rock face a literally vertical cliff "much riven, its fracture planes outlining sharp angular masses in all stages of displacement and dislodgment." Judging from these facts, he interprets the deep valleys with cirques at their heads in formerly glaciated regions where at the head there is a "reversed grade" of slope, as due to ice-erosion at valley-heads where scour is impossible at the sides of the mountain but strongest under the glacier head where the ice is deepest. The opponents of ice-erosion nevertheless recognize the very frequent occurrence of glacial cirques often containing small lakes such as that under Cader Idris in Wales, or at the head of Little Timber Creek, Montana, and numerous examples in Alpine districts.

CIRSTA (mod. Constantine, q.v.), an ancient city of Numidia, in Africa, in the country of the Massyli. It was regarded by the Romans as the strongest postion in Numidia, and was made by them the converging point of all their great military roads in that country. By the early emperors it was allowed to fall into decay, but was afterwards restored by Constantine, from whom it took its modern name.

CISSEY, ERNEST LOUIS OCTAVE COURTOUT DE (1810-1892), French soldier, was born at Paris on the 23rd of September 1810, and after passing through St Cyr entered the army in 1812, becoming captain in 1839. He saw active service in Algeria, and became chef d'escadron in 1849 and lieutenant-colonel in 1850. He took part as a colonel in the Crimean War, and after the battle of Inkerman received the rank of general of brigade. In 1863 he was promoted general of division. When the Franco-German War broke out in 1870, de Cissey was given a divisional command in the Army of the Rhine, and he was included in the surrender of Bazaine's army at Metz. He was released from captivity only at the end of the war, and on his return was at once appointed by the Versailles government to a command in the army engaged in the suppression of the Commune, a task in the execution of which he displayed great rigour. From July 1871 de Cissey sat as a deputy, and he had already become minister of war. He occupied this post several times during the critical period of the reorganization of the French army. In 1880, whilst holding the command of the XI. corps at Nantes, he was accused of having relations with a certain Baroness Kaula, who was said to be a spy in the pay of Germany, and...
he was in consequence relieved from duty. An inquiry subsequently held resulted in de Cisyse's favour (1881). He died on the 15th of June 1882 at Paris.

CISSOID (from the Gr. καῦσον, ivy, and ἐλδός, form), a curve invented by the Greek mathematician Diocles about 240 B.C., for the purpose of constructing two mean proportionals between two given lines, and in order to solve the problem of duplicating the cube. It was further investigated by John Wallis, Christian Huygens (who determined the length of any arc in 1657), and Pierre de Fermat (who evaluated the area between the curve and its asymptote in 1661). It is constructed in the following manner. Let AB be a semicircle, BT the tangent at B, and APT a line cutting the circle in P and BT at T; take a point Q on AB so that AQ always equals PT; then the locus of Q is the cissoid. Sir Isaac Newton devised the following mechanical construction. Take a red rod MN bent at right angles at M, such that MN = AB; let the leg LM always pass through a fixed point O on AB produced such that OA = CA, where C is the middle point of AB, and cause N to travel along the line perpendicular to AB at C; then the midpoint of MN traces the cissoid. The curve is symmetrical about the axis of x, and consists of two infinite branches asymptotic to the line BT and forming a cusp at the origin. The cartesian equation, when A is the origin and AB = 2a, is

\[ y^2(2a-x) = x^2; \]

the polar equation is \( r = 2a \sin \theta \tan \theta \). The cissoid is the first positive pedal of the parabola \( y^2 - 8ax = 0 \) for the vertex, and the inverse of the parabola \( y^2 = 8ax \), the vertex being the centre of inversion, and the semi-latus rectum the constant of inversion. The area between the curve and its asymptote is \( 3\pi a^2 \), i.e. three times the area of the generating circle.

The term cissoid has been given in modern times to curves generated in similar manner from other figures than the circle, and the form described above is distinguished as the cissoid of Diocles.

A cissoid angle is the angle included between the concave sides of two intersecting curves; the convex sides include the striaid angle.

CIS-SUTLEJ STATES, the southern portion of the Punjab, India. The name, now obsolete, came into use in 1609, when the Sikh chiefs south of the Sutlej passed under British protection, and was generally applied to the country south of the Sutlej and north of the Delhi territory, bounded on the E. by the Himalayas, and on the W. by Sirsa district. Before 1846 the greater part of this territory as independent, the chiefs being subject merely to control from a political officer stationed at Umballa, and styled the agent of the governor-general for the Cis-Sutlej states. After the first Sikh War the full administration of the territory became vested in this officer. In 1849 occurred the annexation of the Punjab, when the Cis-Sutlej states commissionship, comprising the districts of Umballa, Ferozepore, Ludhiana, Thanesar and Simla, was incorporated with the new province. The name continued to be applied to this division until 1852, when, owing to Ferozepore having been transferred to the Lahore, and a part of Thanesar to the Delhi division, it ceased to be appropriate. Since then, the tract remaining has been known as the Umballa division. Patiala, Jind and Nabha were appointed a separate political agency in 1851. Excluding Bahawalpur, for which there is no political agent, and Chamba, the other states are grouped under the commissioners of Jullunder and Delhi, and the superintendent of the Simla hill states.

CIST (Gr. κήρυ, Lat. cista, a box; cf. Ger. Kiste, Welsh kist- en, stone-coffin, and also the Eng. form "chest"), in Greek archaeology, a wicker-work receptacle used in the Eleusinian and other mysteries to carry the sacred vessels; also, in the archaeology of prehistoric man, a coffin formed of flat stones placed edgeways with another flat stone for a cover. The word is also used for a sepulchral chamber cut in the rock (see COFFIN).

"Cistem," the common term for a water-tank, is a derivation of the same word (Lat. cisterna; cf. "cave" and "cavern").

CISTERCIONS, otherwise GREY or WHITE MONKS (from the colour of the habit, over which is worn a black scapular or apron). In 1098 St Robert, born of a noble family in Champagne, at first a Benedictine monk, and then abbot of certain hermits settled at Molesmes near Châtillon, being dissatisfied with the manner of life and observance there, migrated with twenty of the monks to a swampy place called Citeaux in the diocese of Chalonos, not far from Dijon. Count Odo of Burgundy here built them a monastery, and they began to live a life of strict observance according to the letter of St Benedict's rule. In the following year Robert was compelled by papal authority to return to Molesmes, and Alberic succeeded him as abbot of Citeaux and held the office till his death in 1109, when the Englishman St Stephen Harding became abbot, until 1134. For some years the new institute seemed little likely to prosper; few novices came, and in the first years of Stephen's abbacy it seemed doomed to failure. In 1112, however, St Bernard and thirty others offered themselves to the monastery, and a rapid and wonderful development at once set in. The next three years witnessed the foundation of the four great "daughter-houses of Citeaux"—La Ferté, Pontigny, Clairvaux and Morimond. At Stephen's death there were over 30 Cistercian houses; at Bernard's (1154) over 200; and by the end of the century over 500; and the Cistercian influence in the Church more than kept pace with this material expansion, so that St Bernard saw one of his monks ascend the papal chair as Eugenius III.

The keynote of Cistercian life was a return to a literal observance of St Benedict's rule—how literal may be seen from the controversy between St Bernard and Peter the Venerable, abbot of Cluny (see Maitland, Dark Ages, § xxii.). The Cistercians rejected alike all mitigations and all developments, and tried to reproduce the life exactly as it had been in St Benedict's time, indeed in various points they went beyond it in austerity. The most striking feature in the reform was the return to manual labour, and especially to field-work, which became a special characteristic of Cistercian life. In order to make time for this work they cut away the accretions to the divine office which had been steadily growing during three centuries, and in Cluny and the other great houses the monks had to do the work of the regular canonical office: one only of these accretions did they retain, the daily recitation of the Office of the Dead (Edm. Bishop, Origin of the Primer, Early English Text Society, original series, 109, p. xxx.).

It was as agriculturists and horse and cattle breeders that, after the first blush of their success and before a century had passed, the Cistercians exercised their chief influence on the progress of civilization in the later middle ages: they were the great farmers of those days, and many of the improvements in the various farming operations were introduced and propagated by them; it is from this point of view that the importance of their extension in northern Europe is to be estimated. The Cistercians at the beginning renounced all sources of income arising from benefices, tithes, tolls and rents and depended for their income wholly on the land. This developed an organized system for selling their farm produce, cattle and horses, and notably contributed to the commercial progress of the countries of western Europe. Thus by the middle of the 15th century the export of wool by the English Cistercians had become a feature in the commerce of the country. Farming operations on so extensive a scale could not be carried out by the monks alone, whose choir and religious duties took up a considerable portion of their time; and so from the beginning the system of lay brothers was introduced on a large scale. The lay brothers were recruited from the peasantry and were simple uneducated men, whose function consisted in carrying out the various field-works and plying all sorts of useful trades; they formed a body
of men who lived alongside of the choir monks, but separate from them, not taking part in the canonical office, but having their own fixed round of prayer and religious exercises. A lay brother was never ordained, and never held any office of superiority. It was by this system of lay brothers that the Cistercians were able to play their distinctive part in the progress of European civilization. But it often happened that the number of lay brothers became excessive and out of proportion to the resources of the monasteries, there being sometimes as many as 200, or even 300, in a single abbey. On the other hand, at any rate in some countries, the system of lay brothers in course of time worked itself out; thus in England by the close of the 14th century it had shrunk to relatively small proportions, and in the 15th century the régime of the English Cistercian houses tended to approximate more and more to that of the Black Monks.

The Cistercian policy calls for special mention. Its lines were adumbrated by Alberic, but it received its final form at a meeting of the abbots in the time of Stephen Harding, when was drawn up the Carta Caritatis (Migne, Patr. Lat. clxi. 1377), a document which arranged the relations between the various houses of the Cistercian order, and exercised a great influence also upon the future course of western monachism. From one point of view, it may be regarded as a compromise between the primitive Benedictine system, whereby each abbey was autonomous and isolated, and the complete centralization of Cluny, whereby the abbey of Cluny was the only true superior in the body. Citeaux, on the one hand, maintained the independent organic life of the houses—each abbey had its own abbots, elected by its own monks; its own community, belonging to itself and not to the order in general; its own property and finances administered by itself, without interference from outside. On the other hand, all the abbeys were subjected to the general chapter, which met yearly at Citeaux, and consisted of the abbots only; the abbots of Citeaux was the president of the chapter and of the order, and the visitor of each and every house, with a predominant influence and the power of enforcing everywhere exact conformity to Citeaux in all details of the exterior life—observance, chant, customs. The principle was that Citeaux should always be the model to which all the other houses had to conform. In case of any divergence of view at the chapter, the side taken by the abbots of Citeaux was always to prevail (see F. A. Gasquet, Sketch of Monastic Constitutional History, pp. xxxv-xxxviii, prefixed to English trans. of Montalembert's Monks of the West, ed. 1865).

By the end of the 12th century the Cistercian houses numbered 500; in the 13th a hundred more were added; and in the 15th, when the order attained its greatest extension, there were close on 750 houses: the larger figures sometimes given are now recognized as apocryphal. Nearly half of the houses had been founded, directly or indirectly, from Clairvaux, so great was St Bernard's influence and prestige: indeed he has come almost to be regarded as the founder of the Cistercians, who have often been called "the Bernardines." The chief Cistercian establishments in Europe,—chiefly in France, but also in Germany, England, Scotland, Ireland, Sweden, Poland, Hungary, Italy and Sicily, Spain and Portugal,—where some of the houses, as Alcobaca, were of almost incredible magnificence. In England the first foundation was Furness (1127), and many of the most beautiful monastic buildings of the country, beautiful in themselves and beautiful in their sites, were Cistercian,—as Tintern, Rievaulx, Byland, Fountains. A hundred were established in England in the next hundred years, and then only one more up to the Dissolution (for list, see table and map in F. A. Gasquet's English Monastic Life, or Catholic Dictionary, art. "Cistercians").

For a hundred years, till the first quarter of the 13th century, the Cistercians supplanted Cluny as the most powerful order and the chief religious influence in western Europe. But then in turn their influence began to wane, chiefly, no doubt, because of the rise of the mendicant orders, which ministered more directly to the needs and ideas of the new age. But some of the reasons of Cistercian decline were internal. In the first place, there was the permanent difficulty of maintaining in its first fervour a body embracing hundreds of monasteries and thousands of monks spread all over Europe; and as the Cistercian very raison d'être consisted in its being a "reform," it came to primitive monachism, with its field-work and severe simplicity, any failures to live up to the ideal proposed worked more disastrously among Cistercians than among mere Benedictines, who were intended to live a life of self-denial, but not of great austerity. Relaxations were gradually introduced in regard to diet and to simplicity of life, and also in regard to the sources of income, rents and tolls being admitted and benefits incorporated, as was done among the Benedictines; the farming operations tended to produce a commercial spirit; wealth and splendour invaded many of the monasteries, and the choir monks abandoned field-work.

The later history of the Cistercians is largely one of attempted revivals and reforms. The general chapter for long battled bravely against the invasion of relaxations and abuses. In 1335 Benedict XII., himself a Cistercian, promulgated a series of regulations to restore the primitive spirit of the order, and in the 15th century various popes endeavoured to promote reforms. All these efforts at a reform of the great body of the order proved unavailing; but local reforms, producing various semi-independent offshoots and congregations, were successfully carried out in many parts in the course of the 15th and 16th centuries. In the 17th another great effort at a general reform was made, promoted by the pope and the king of France; the general chapter elected Richelieu (commendatory) abbot of Citeaux, thinking he would protect them from the threatened reform. In this they were disappointed, for he threw himself wholly on the side of reform. So great, however, was the resistance, and so serious the disturbances that ensued, that the attempt to reform Citeaux itself and the general body of the houses had again to be abandoned, and only local projects of reform could be carried out. In 1598 had arisen the reformed congregation of the Feuillants, which spread widely in France and Italy; and in the latter country under the name of "Improved Bernardines." The French congregation of Sept-Fontaines (1659) also deserves mention. In 1665 de Rançon formed La Trappe (see Trappists).

The Reformation, the ecclesiastical policy of Joseph II., the French Revolution, and the revolutions of the 19th century, almost wholly destroyed the Cistercians; but some survived, and since the beginning of the last half of the 19th century there has been a considerable recovery. They are at present divided into three bodies: (1) the Common Observance, with about 30 monasteries and 800 choir monks, the large majority being in Austria-Hungary; they represent the main body of the order and follow a mitigated rule of life; they do not carry on field-work, but have large secondary schools, and are in manner of life little different from fairly observant Benedictine Black monks; of late years, however, signs are not wanting of a tendency towards a return to older ideas; (2) the Middle Observance, embracing some dozen monasteries and about 150 monks, with 1500 nuns; (3) the Strict Observance, or Trappists (q.v.), with nearly 60 monasteries, about 1600 choir monks and 2000 lay brothers.

In all there are about 100 Cistercian monasteries and about 4700 monks, including lay brothers. There have always been a large number of Cistercian nuns; the first nunery was founded at Tart in the diocese of Langres, 1125; at the period of their widest extension there are said to have been 900 nunneries, and the communities were very large. The nuns were devoted to contemplation and also did field-work. In Spain and France certain Cistercian abbeys had extraordinary privileges. Numerous reforms took place among the nuns. The best known of all Cistercian convents was probably Font-Royal (q.v.), reformed by Angélique Arnaud, and associated with the story of the Jansenist controversy. After all the troubles of the 19th century there still exist 100 Cistercian nunneries with 3000 nuns, choir and lay; of these, 15 nunneries with 900 nuns are Trappist.

Accounts of the beginnings of the Cistercians and of the primitive life and spirit will be found in the lives of St Bernard, the best
whereof is that of Abbé E. Vacandard (1895); also in the Life of St Stephen Harding, in the English Saints. See also Henry Collins (one of the Oxford Movement, who became a Cistercian), Spirit and Mission of the Cistercian Order (1866). The facts are related in Helyot, Hist. des ordres religieux (1792), v. 1. 114-146. vi. cc. 1, 2. Useful sketches, with references to the literature, are supplied in Herzog, Realencyklopadie (ed. 3), art. "Cisterciens"; Wetzer und Welte, Kirchenlexikon (ed. 2), art. "Cistercienserorden"; Max Heimbucher, Orden und Kongregationen (1886), i. §§ 33, 34. Prof. Brewer’s discriminating, yet on the whole sympathetic, Preface to vol. iv. of the Works of Giraldus Cambrensis (Rolls Series of Chronicles and Memorials) is very instructive. Denis Murphy’s Triumphal Arch (1901) contains a general sketch, with a particular account of the Irish Cistercians. (E. C. B.)

CITATION (Lat. citare, to cite), in law, a summons to appear, more particularly applied in England to process in the probate and divorce division of the high court. In the ecclesiastical courts, citation was a method of commencing a probate suit, answering to a writ of summons at common law, and it is now in English probate practice an instrument issuing from the principal probate registry, chiefly used when a person, having the superior right to take a grant, delays or declines to do so, and another having an inferior right desires to obtain a grant; the party having the prior right is cited to appear and either to renounce the grant or show cause why it should not be decreed to the citator. In divorce practice, when a petitioner has filed his petition and affidavit, he extracts a citation, i.e. a command drawn in the name of the sovereign and signed by one of the registrars of the court, calling upon the alleged offender to appear and make answer to the petition. In Scots law, citation is used in the sense of a writ of summons. The word in its more general legal sense means the act of quoting, or the referring to an authority in support of an argument.

CÔTEUX, a village of eastern France, in the department of Côte d’Or, 16 m. S.S.E. of Dijon by road. It is celebrated for the great abbey founded by Robert, abbot of Molems, in 1098, which became the headquarters of the Cistercian order. The buildings which remain date chiefly from the 18th century and are of little interest. The church, destroyed in 1792, used to contain the tombs of the earlier dukes of Burgundy.

CITHAERON, now called from its pine forests Elatea, a famous mountain range (4526 ft.) in the south of Boeotia, separating that state of Megara and Attica. It was famous in Greek mythology, and is frequently mentioned by the great poets, especially Homer. It was known by the Cithaeronian Actaeon, who was changed into a stag, that Pentheus was torn to pieces by the Bacchantes whose orgies he had been watching, and that the infant Oedipus was exposed. This mountain, too, was the scene of the mystic rites of Dionysus, and the festival of the Daidala in honour of Hera. The carriage-road from Athens to Thebes crosses the range by a picturesque defile (the pass of Dryos-Cephalae, "Oak-heads"), which was at one time guarded on the Attic side by a strong fortress, the ruins of which are known as Gypsy-kastro ("Gipsy Castle"). Plataea is situated on the north slope of the mountain, and the strategy of the battle of 479 B.C. was considerably affected by the fact that it was necessary for the Greeks to keep their communications open by the passes (see PLATAEA). The best known of these is that of Dryos-Cephalae, which was in its ancient state from Athens to Thebes. Two other passes, farther to the west, were crossed by the roads from Plataea to Athens and to Megara respectively.

CITHARA (Assyrian chatara; Gr. κιθάρα; Lat. cithara; perhaps Heb. קינורה, קינור), one of the most ancient stringed instruments, traced back to 1700 B.C. among the Semitic races, in Egypt, Assyria, Asia Minor, Greece and the Roman empire, whence the use of it spread over Europe. The main feature of the Greek κιθάρα, its shallow sound-chest, being the most important part of it, is also that in which developments are most noticeable; its contour varied considerably during the many musical ages, but the characteristic in respect of which it foreshadowed the precursors of the violin family, and by which they were distinguished from other contemporary stringed instruments of the middle ages, was preserved in all European descendants bearing derived names. This characteristic box sound-chest (fig. 1) consisted of two resonating tables, either flat or delicately arched, connected by ribs or sides of equal width. The cithara may be regarded as an attempt by a more skilful craftsman or race to improve upon the lyre (q.v.), while retaining some of its features. The construction of the cithara can fortunately be accurately studied from two actual specimens found in Egypt and preserved in the museums of Berlin and Leiden. The Leiden cithara (fig. 2), which forms part of the d’Anastasy Collection in the Museum of Antiquities, is in a very good state of preservation. The sound-chest, in the form of an irregular square (17 cm. × 17 cm.), is hollowed out of a solid block of wood from the base, which is open; the little bar, seen through the open base and measuring 2 cm. (1 in.), is also of the same piece of wood. The arms, one short and one long, are solid and are fixed to the body by means of wooden pins; they are glued as well for greater strength. W. Pleyel, through whose courtesy the sketch was revised and corrected, states that there are no indications on the instrument of any kind of bridge or attachment for strings except the little half-loop of iron wire which passes through the base from back to front. To this the strings were probably attached, and the little bar performed the double duty of sound-post and support for strengthening the tail-piece and enabling it to resist the tension of the strings. The oblique transverse bar, rendered necessary by the increasing length of the strings, was characteristic of the Egyptian cithara,1 whereas the Asiatic and Greek instruments were generally constructed with bars resting on arms of equal length, the pitch of the strings being varied by thickness and tension, instead of by length. (For the Berlin cithara see LYRE.)

The number of strings with which the cithara was strung varied from 4 to 9 or 20 at different times; they were added less for the purpose of increasing the compass in the modern sense than to enable the performer to play in the different modes of the Greek musical system. Terpander is credited with having increased the number of strings to seven; Euclides, quoting him as his authority, states that "loving no more Egyptian Cithara than the tetrachordal chant, we will sing aloud new hymns to a seven-toned phorminx." What has been said of the scale of the lyre applies also to the cithara, and need therefore not be repeated here. The strings were vibrated by means of the fingers or plectrum (φθόρα), from φθέρω, to strike; Lat. plectrum, from plango, I strike). Twangling with the fingers for strings of gut, hemp or silk was undoubtedly the more artistic method, since the player was able to command various shades of expression which are impossible

---

1. A drawing of an Egyptian cithara, similar to the Leiden specimen, may be seen in Champollion, Monuments de l’Egypte et de la Nubie, ii. pl. 175.
with a rigid plectrum. Loudness of accent and great brilliancy of tone, however, can only be obtained by the use of the plectrum. Quotations from the classics abound to show what was the practice of the Greeks and Romans in this respect. The plectrum was held in the right hand, with elbow outstretched and palm bent inwards, and the strings were plucked with the straightened fingers of the left hand. Both methods were used with intention according to the dictates of art for the sake of the variation in tone colour obtainable thereby.

The strings of the cithara were either knotted round the transverse tuning bar itself (zugon) or to rings threaded over the bar, which enabled the performer to increase or decrease the tension by shifting the knots or rings; or else they were wound round pegs, knobs or pins fixed to the zugon. The other end of the strings was secured to a tail-piece after passing over a flat bridge, or the two were combined in the curious high box tail-piece which acted as a bridge. Plutarch states that this contrivance was added to the cithara in the days of Cepion, pupil of Terpander. These boxes were hinged in order to allow the lid to be opened for the purpose of securing the strings to some contrivance concealed therein. It is a curious fact that no sculptured cithara provided with this box tail-piece is represented with strings, and in many cases there could never have been any, for the hand and arm are visible across the space that would be filled by the strings, which are always carved in a solid block.

Like the lyre the cithara was made in many sizes, conditioned by the pitch and the use to which the instrument was to be put. These instruments may have been distinguished by different names; the petic, for instance, is declared by Sappho (22nd fragment) to have been small and shrill; the phorminx, on the other hand, seems to have been identical with the cithara.

The Greek kithara was the instrument of the professional singer or citharoedus (citharoedus) and of the instrumentalist or citharist (citharistan), and thus served the double purpose of (1) accompanying the voice—a use placed by the Greeks far above mere instrumental music—in epic recitations and rhapsodies, in odes and lyric songs; and (2) of accompanying the dance; it was also used for playing solos at the national games, at receptions and banquets and at trials of skill. The costume of the citharoedus and citharist was rich and recognized as being distinctive; it varied but little throughout the ages, as may be deduced from a comparison of representations of the citharoedus on a coin and on a Greek vase of the best period (fig. 4). The costume consisted of a pallio or long tunic with sleeves embroidered with gold and gilt high above the waist, falling in graceful folds to the feet. This pallio must not be confounded with the mantile of the same name worn by women. Over one shoulder, or hanging down the back, was the purple cithams or cloak, and on his brow a golden wreath of laurels. All the citharoedoi bear instruments of the type here described as the cithara, and never one of the lyre type. The records of the citharoedoi extend over more than thirteen centuries and fall into two natural divisions: (1) The mythological period, approximately from the 13th century B.C. to the first Olympiad, 776 B.C.; and (2) the historical period to the days of Ptolemy, A.D. 161. One of the very few authentic Greek odes extant is a Pythian ode by Pindar, in which the phorminx of Apollo is mentioned; the solo is followed by a chorus of citharoedi. The scope of the solemn games and processions, called Panathenaee, held every four years in honour of the goddess Athena, which originally consisted principally of athletic sports and horse and chariot races, was extended under Peisistratus (c. 540 B.C.), and the celebration made to include contests of singers and instrumentalists, recitations of portions of the Iliad and Odyssey, such as are represented on the frieze of the Parthenon (in the Elgin Room at the British Museum) and later on friezes by Hephæas. It was at the same period that the first contests for solo-playing on the cithara (kitharoides) and for solo aulos-playing were instituted at the 8th Pythian Games. One of the principal items at these contests for aulos and cithara was the Nomos Pythikos, descriptive of the victory of Apollo over the python and of the defeat of the monster.

The Pythian Games survived the classic Greek period and were continued under Roman sway until about A.D. 394. Not only were these games held at Delphi, but smaller contests, called Pythia, modelled on the great Pythian, were instituted in various provinces of the empire, and more especially in Asia Minor.

The games lasted for several days, the first being devoted to music. To the games at Delphi came musicians from all parts of the civilized world, and the Spaniards, at the beginning of our era, had attained to such a marvellous proficiency in playing the cithara, an instrument which they had learnt to know from the Phoenician colonists before the conquest by the Romans, that some of their citharoedoi easily carried off the honours at the musical contests. The consul Metellus was so charmed with the music of the Spanish competitors that he sent some to Rome for the festivals, where the impression created was so great that the Spanish citharoedoi obtained a permanent footing in Rome. Aulus Gallius (Not. Att.) describes an incident at a banquet which corroborates this statement.

The degeneration of music as an art among the Romans, and its gradual degradation by association with the sensual amusements of corrupt Rome, nearly brought about its extinction at the end of the 4th century, when the condemnation of the Church closed the theatres, and the great national games came to an end. Instrumental music was banished from civil life and from religious rites, and thenceforth the slender threads which connect the musical instruments of Greeks and Romans with those of

8 See Visconti, Museo Clementino, pl. 22, Erato's cithara, and in the same work that of Apollo Citharoedus (fig. 3 above).
9 See Od. i. 153. 195; II. xvii. 599-570. In Homer the form is always kithara.
10 See Pausanias x. 7, 5 § 4 et seq.
the middle ages must be sought among the unconverted barbarians of northern and western Europe, who kept alive the traditions taught them by conquerors and colonists; but as civilization was in its infancy with them the instruments sent out from their workshops must have been crude and primitive. Asia, the cradle of the cithara, also became its foster-mother; it was among the Greeks of Asia Minor that the several steps in the transition from cithara into guitar (q.v.) took place.

The first of these steps produced the rotta (q.v.), by the construction of body, arms and transverse bar in one piece. The Semitic races used the rotta at a very remote period (1700 B.C.), as we know from a fresco at Beni-Hasan, dating from the reign of Senwosret II., which depicts a procession of strangers bringing tribute; among them is a bearded musician of Semitic type bearing a rotta which he holds horizontally in front of him in the Assyrian manner, and quite unlike the Greeks, who always played the lyre and cithara in an upright position. A unique specimen of this rectangular rotta was found in an Alhammic tomb of the 5th or 6th century at Oberfach in the Black Forest. The instrument was clasped in the arms of an armed knight; it is now preserved in the Volker Museum in Berlin. This old German rotta is an exact counterpart of instruments pictured in illuminated MSS. of the 8th century, and is derived from the cithara with rectangular body, while from the cithara with a body having the curve of the lower half of the violin was produced a rotta with the outline of the body of the guitar.

Both types were common in Europe until the 14th century, some played with a bow, others twanged by the fingers, and bearing indifferently both names, cithara and rotta. The addition of an B.C. upper-board, stretching like a short neck from body to transverse bar, leaving on each side of the finger-board space for the hand to pass through in order to stop the strings, produced the crwth or crown (q.v.), and brought about the reduction in the number of the strings to three or four. The conversion of the rotta into the guitar (q.v.) was an easy transition effected by the addition of a long neck to a body derived from the oval rotta. When the bow was applied the result was the guitar or troubadour fiddle. At first the instrument called cithara in the Latin versions of the Psalms was glossed citron, citre in Anglo-Saxon, but in the 11th century the same instrument was rendered hearpon, and in French and English harpe or harp, and our modern versions have retained this translation. The cithara (q.v.) is a later descendant of the cithara, although preserving the characteristic features of the cithara, the shallow sound-chest with ribs, adopted the pear-shaped outline of the Eastern instruments of the late tribe.

CITIUM (Gr. Kition), the principal Phoenician city in Cyprus, situated at the north end of modern Larnaka, on the bay of the same name on the S.E. coast of the island. Converging currents from E. and W. meet and pass seawards off Cape Kití a few miles south, and greatly facilitated ancient trade. To S. and W. the site is protected by lagoons, the salt from which was one of the sources of its prosperity. The earliest remains near the site go back to the Mycenean age (c. 1400–1100 B.C.) and seem to mark an Aegean colony: x 2 but in historic times Citium is the chief centre of Phoenician influence in Cyprus. This was still a recent settlement in the 7th century is suggested by an inscription in a list of the allies of Assur-bani-bal of Assyria in 668 B.C. to a King Damosu of Karkhadiast (Phoenician for "New-town"), where Citium would be expected. A Phoenician dedication to "Baal of Lebanon" found here, and dated also to the 7th century, suggests that Citium may have belonged to Tyre. The biblical name Kittim, derived from Citium, is in fact used quite generally for Cyprus as a whole; 3 later also for Greeks and Romans in general. 4 The discovery here of an official monument of Sargon II. suggests that Citium was the administrative centre of Cyprus during the Assyrian period (709–668 B.C.). During the Greek revolts of 500, 356 B.C., and 332 B.C., Citium led the side loyal to Persia and was besieged by an Athenian force in 440 B.C.; its extensive necropolis proves that it remained a considerable city even after the Greek cause triumphed with Alexander. But like other cities of Cyprus, it suffered repeatedly from earthquakes, and in medieval times when its harbour became silted the population moved to Larnaca, on the open roadstead, farther south. Harbour and citadel have now quite disappeared, the latter having been used to fill up the former shortly after the British occupation; some gain to health resulted, but an irreparable loss to science. Traces remain of the circuit wall, and of a sanctuary with copious terra-cotta offerings; the large necropolis yields constant loot to illicit excavation.

CITIZEN (a form corrupted in Eng., apparently by analogy with "denizen," from O. Fr. citoien, mod. Fr. citoyen), etymologically the inhabitant of a city, civis or civitas (see Civy), and in England the term still used primarily of persons possessing civic rights in a borough; thus used also of a townsman as opposed to a countryman. The more extended use of the word, however, corresponding to civis, gives "citizen" the meaning of one who is a constituent member of a state in international relations and as such has full national rights and owes a certain allegiance (q.v.) as opposed to an "alien"; in republican countries the term is then commonly employed as the equivalent of "subject" in monarchies of feudal origin. For the rules governing the obtaining of citizenship in this latter sense in the United States and elsewhere see Naturalization.

CITOLE, also spelled SYTOLE, CYTHELE, CYTOLLE, &c. (probably a Fr. diminutive form of cithara, and not from Lat. ista, a box), an obsolete musical instrument of which the exact form is uncertain. It is frequently mentioned by poetical writers of the 13th to the 15th centuries, and is found in Wycliffe's Bible (1360) in 2 Samuel vi. 5, "Harpis and sitols and tympane." The Authorized Version has "psaltitories," and the Vulgate "lyrae." It has been supposed to be another name for the psaltery (q.v.), a bow-shaped instrument often seen in the illuminated manuscripts of the 13th century.

CITRIC ACID, Acidum citricum, or Oxytrichoballic Acid, CH₂(OH)₂(CO-OH), a tetrabehydroxytribasic acid, first obtained in the solid state by Karl Wilhelm Scheele, in 1784, from the juice of lemons. It is present also in oranges, citrons, carambols, gooseberries and many other fruits, and in several bulbs and tubers. It is made on a large scale from lime or lemon juice, and also by the fermentation of juice under the influence of Citromycetes pfefferianus, C. glaber and other ferment. Lemon juice is fermented for some time to free it from mucilage, then boiled

---

1 For a discussion of this question see Kathleen Schlesinger, The Instruments of the Orchestra, part ii., and especially chapters on the cithara in transition during the middle ages, and the question of the origin of the Utrecht Psalter, in which the evolution of the cithara is traced at some length.

2 Cf. the name Kathian in a Ramesseid list of cities of Cyprus, Oberhumer, Die Insel Cypryn (Munich, 1903). p. 4.

3 Gen. x. 4; Num. xxiv. 24; Is. xxiii. 1, 12; Jer. ii. 10; Ezek. xxvi. 6.

and filtered, and neutralized with powdered chalk and a little milk of lime; the precipitate of calcium citrate so obtained is decomposed with dilute sulphuric acid, the solution filtered, evaporated to remove calcium sulphate and concentrated, prepared in various ways. The resulting crystalline tartaric acid, and the impurities of calcium citrate, are dissolved in water; the precipitate of calcium carbonate is separated by the addition of a little hydrochloric acid, and redissolved in a strong boiling solution of the acid. About 20 gallons of lemon juice should yield about 10 lb of crystallized citric acid. The acid may also be prepared from the juice of unripe gooseberries. Calcium citrate must be manufactured with care to avoid an excess of chalk or lime, which would precipitate constituents of the juice that cause the fermentation of the citrate and the production of calcium acetate and butyrate.

The synthesis of citric acid was accomplished by L. E. Grimaux and P. Adam in 1881. Glycerin when treated with hydrochloric acid gives propenyl dichlorhydric, which may be oxidized to d-chloracetonitrile. This compound combines with hydrocyanic acid to form a nitrile which hydrolyses to dichlorhydrino iso-butyrlic acid. Potassium cyanide reacts with this acid to form the corresponding dinitrile, which is converted by hydrocyanic acid into citric acid. This series of operations proves the constitution of the acid. A. Haller and C. A. Held synthesized the acid from ethyl chloride-acetocetate (from chlorin and acetacetic ester) by heating with potassium cyanide and saponifying the resulting nitrile. The acetone dicarboxylate, CO(\(\text{CH}_2\text{CO}_2\text{H})_2\), so obtained combines with hydrocyanic acid, and this product yields citric acid on hydrolysis.

Citric acid has an agreeable sour taste. It is soluble in 4 lbs of its weight of cold, and in half its weight of boiling water, and dissolves in alcohol, but not in ether. At 150° C. it melts, and on the continued application of heat boils, giving off its water of crystallization. At 175° C. it is resolved into water and acetic acid, \(\text{C}_6\text{H}_5\text{O}_2\), a substance found in Equisium Juventile, monkshood and other plants. A higher temperature decomposes this body into carbon dioxide and itaconic acid, \(\text{C}_6\text{H}_5\text{O}_2\), which, again, by the expulsion of a molecule of water, yields citraconic and oxalic acids, \(\text{C}_6\text{H}_4\text{O}_2\). Citric acid digested at a temperature below 40° C. with concentrated sulphuric acid gives off carbon monoxide and forms acetic dicarboxylic acid. With fused potash it forms potassium oxalate and acetate. It is a strong acid, and dissolved in water decomposes carbonates and attacks iron and zinc.

The citrates are a numerous class of salts, the most soluble of which are those of the alkaline metals; the citrates of the alkaline earth metals are insoluble. Citric acid, being tribasic, forms either acid monometallic, acid dimetallc or neutral trimetallc salts; thus, mono-, di- and tri-potassium and sodium citrates are known. On warming citric acid with an excess of lime water a precipitate of calcium citrate is obtained which is redissolved as the liquid cools.

The impurities occasionally present in commercial citric acid are salts of potassium and sodium, traces of iron, lead and copper derived from the vessels used for its evaporation and crystallization, small amounts of phloroglucin, tartaric and even oxalic acid. Tartaric acid, which is sometimes present in large quantities as an adulterant in commercial citric acid, may be detected in the presence of the latter, by the production of a precipitate of potassium tartarate when potassium acetate is added to a cold solution. Another mode of separating the two acids is to convert them into calcium salts, which are then treated with a perfectly neutral solution of cupric chloride, soluble cupric citrate and calcium chloride being formed, while cupric tartrate remains undissolved. Citric acid is also distinguished from tartaric acid by the fact that an ammonia solution of silver tartrate produces a brilliant silver mirror when boiled, whereas silver citrate is reduced only after prolonged ebulition.

Citric acid is used in calico printing, also in the preparation of effervescing draughts, as a refrigerant and saltpolgethe, and occasionally as an antiscorbutic, instead of fresh lemon juice. In the form of lime juice it has long been known as an antidote for scurvy. Several of the citrates are much employed as medicines, the most important being the scale preparations of iron. Of these iron and ammonium citrate is much used as a haematinic, and as it has hardly any tendency to cause gastric irritation or constipation it can be taken when the ordinary forms of iron are impossible. The sodium citrate and silver citrate are used as a bitter stomachic and tonic. In the blood citrates are oxidized into carbonates; they therefore act as remote alkalis, increasing the alkalinity of the blood and thereby the general rate of chemical change within the body (see ACETIC ACID).

**CITRON**, a species of Citrus (C. medica), belonging to the tribe Aurantioide, of the botanical natural order Rutaceae; the same genus furnishes also the orange, lime and shaddock. The citron is a small evergreen tree or shrub growing to a height of about 10 ft.; it has irregular straggling spiny branches, large pale-green broadly oblong, slightly serrate leaves and generally unisexual flowers purplish without and white within. The large fruit is ovate or oblong, proterobent at the tip, and from 5 to 6 in. long, with a tough, furrowed, adherent rind, the inner portion of which is thick, white and flleshy, the outer, thin, greenish-yellow and very fragrant. The pulp is sub-acid and edible, and the seeds are bitter. There are many varieties of the fruit, some of them greatly exceeding the native size.

At the end of November and the beginning of December, the Madras citron has the form of an oblate sphere; and in the "fingered citron" of China the lobes are separated into finger-like divisions formed by separation of the constituent carpels, as occurs sometimes in the orange.

The citron-tree thrives in the open air in China, Persia, the West Indies, Madeira, Sicily, Corsica, and the warmer parts of Spain and Italy; and in conservatories it is often to be seen in more northerly regions. Sir Joseph Hooker (Flora of British India, i. 542) regards it as a native of the valleys at the foot of the Himalaya, and of the Khasia hills and the Western Ghauts; Dr Bonavia, however, considers it to have originated in Cochin China or China, and to have been introduced into India, whence it spread to Media and Persia. It was described by Theophrastus as growing in Media, three centuries before Christ, and was early known to the ancients, and the fruit was held in great esteem by them; but they seem to have been acquainted with no other member of the Aurantioide, the introduction of oranges and lemons into the countries of the Mediterranean being due to the Arabs, between the 10th and 15th centuries. Josephus tells us that "the law of the Jews required that at the feast of tabernacles every one should have branches of palm-tree and citron-tree" (Antiq. xii. 13; 9), and the Hebrew word tappouch, rendered "apples" and "apple-tree" in Cant. ii. 3, 5, Prov. xxv. 11, 16., probably signifies the citron-tree and its fruit. Orbaüs in the 4th century describes the fruit, accurately distinguishing the three parts of it. About the 3rd century the tree was introduced into Italy; and, as Gallesio informs us, it was much grown at Salerno in the 11th century. In China citrons are placed in apartments to make them fragrant. The rind of the citron yields two perfumes, oil of citron and oil of citron, isomeric with oil of turpentine; and when candied it is much esteemed as a dessert and in confectionery. The lemon (q.v.) is now generally regarded as a subspecies Limonum Citri var. "Citron." (q.v.).

Bonavia, The Cultivated Oranges and Lemons, 8vo (1860); Ceylon.

**CITTADELLA**, a town of Venetia, Italy, in the province of Padua, 20 m. N.W. by rail from the town of Padua; 110 ft. above sea-level. Pop. (1901) town, 3616; commune, 9686. The town was founded in 1220 by the Paduans to counterbalance the fortification of Castelfranco, 8 m. to the E., in 1218 by the Trevisans, and retains its well-preserved medieval walls, surrounded by a wet ditch. It was always a fortress of importance, and in modern times is a centre for the agricultural produce of the district, being the junction of the lines from Padua to Bassano and from Vicenza to Treviso.

**CITTÀ DELLA PIEVE**, a town and episcopal see of Umbria, Italy, in the province of Perugia, situated 1666 ft. above the sea,
CITTÀ DI CASTELLO—CITRÓN

3 m. N.E. of its station on the railway between Chiussi and Orvieto. Pop. (1901) 8,381. Etruscan tombs have been found in the neighbourhood, but it is not certain that the present town stands on an ancient site. It was the birthplace of the painter Pietro Vannucci (Perugino), and possesses several of his works, but none of the first rank.

CITTÀ DI CASTELLO, a town and episcopal see of Umbria, Italy, in the province of Perugia, 38 m. E. of Arezzo by rail (18 m. direct), situated on the left bank of the Tiber, 945 ft. above sea-level. Pop. (1901) of town, 6062; of commune, 26,885. It occupies, as inscriptions show, the site of the ancient Tiberiurn, near which Pliny had a villa (Epist. v. 6; cf. H. Winnefeld in Jahrbuch des deutschen archäologischen Instituts, vi. Berlin, 1891, 233), but no remains exist above ground. The town was devastated by Totila, but seems to have recovered. We find it under the name of Castrum Felicitatis at the end of the 8th century. The bishopric dates from the 7th century. The town went through various political vicissitudes in the middle ages, being subject now to the emperor, now to the Church, until in 1468 it came under the Vitelli; but when they died it out it returned to the allegiance of the Church. It is built in the form of a rectangle and surrounded by a wall of 1488 and contains six houses and buildings of the Renaissance, especially the palaces of the Vitelli, and the cathedral, originally Romanesque. The 12th-century altar front of the latter in silver is fine. The Palazzo Comunale is of the 14th century. Some of Raphael's earliest works were painted for churches in this town, but none of them remains there. There is, however, a small collection of pictures.

See Magherini Graziani, L' Arte a Città di Castello (1897).

CITTÀ VECCHIA, or CITTÀ NOTABILE, a fortified city of Malta, 7 m. W. of Valletta, with which it is connected by railway. Pop. (1901) 7,515. It lies on high, sharply rising ground which affords a view of a large part of the island. It is the seat of a bishop, and contains an ornate cathedral, overthrown by an earthquake in 1693; but rebuilt, which is said by an acceptable tradition to occupy the site of the house of the governor Publius, who welcomed the apostle Paul. It contains some rich stalls of the 15th century and other objects of interest. In the rock beneath the city there are some remarkable catacombs in part of pre-Christian origin, but containing evidence of early Christian burial; and a grotto, reputed to have given shelter to the apostle, is pointed out below the church of San Paolo. Remains of Roman buildings have been excavated in the town. About 2 m. E. of the town is the residence of the English governor, known as the palace of S. Antonio; and at a like distance to the south is the ancient palace of the grand masters of the order of St John, with an extensive public garden called Il Boschetto. Città Vecchia was called Civitas Melita by the Romans and oldest writers, Medina (i.e. the city) by the Saracens, Notabile (locule notabile, et insigne corona regiae, as it is called in a charter by Alphonso, 1428) under the Sicilian rule, and Città Vecchia (old city) by the knights. It was the capital of the island till its supersedure by Valletta in 1570. (See also MALTA.)

CITRÓN (also CITRÓN, CITRÓN, CITHRÓN, CITHARÉN, &c.; Fr. cite, citre, cithre, guitare allemande or angloise; Ger. Cither, Zither (mit Hals, with neck); Ital. cetera, cetra), a medieval stringed instrument with a neck terminating in a grotesque and twanged by fingers or plectrum. The popularity of the cittern was at its height in England and Germany during the 16th and 17th centuries. The cittern consists of a box with a pear-shaped body similar to that of the lute but with a flat back and sound-board joined by ribs. The neck was provided with a fretted finger-board; the head was curved and surmounted by a grotesque head of a woman or of an animal.1 The strings were of wire in pairs of unisons, known as courses, usually four in number in England. A peculiarity of the cittern lay in the tuning of the courses, the third course known as bass being lower than the fourth staved tenor.

According to Vincentio Galilei (the father of the great astronomer) England was the birthplace of the cittern.2 Several lesson books for this popular instrument were published during the 17th century in England. A very rare book (of which the British Museum does not possess a copy), The Citharum Schoole, written by Anthony Holborne in 1597, is mentioned in Sir P. Lely's manuscript commonplace book3 dated 1656, "For the little Instrument called a Psittyrne Anthony Holborne and Tho. Robinson were most famous of any before them and have both of them set out a booke of Lessons for this Instrument. Holborne has composed a Basse-parte for the Viole to play unto the Psittyrne with those Lessons set out in his booke. These lived about Anno Domini 1600."4 Thomas Robinson's New Citharum Lessons with perfect tunings for the same from Four course of strings to Fourteen course, &c. (printed London, 1609, by William Barley), contains illustrations of both kinds of instruments. The fourteen-course cittern was also known in England as Cittharn; the seven courses in pairs were stretched over the finger-board, and the seven single strings, fastened to the grotesque head, were stretched as in the lyre a vide alongside the neck; all the strings rested on the one flat bridge near the tail-piece. Robinson gives instructions for learning to play the cittern and for reading the tablature. John Playford's Musick's Delight on the Cithern (London, 1666) also contains illustrations of the instrument as well as of the viol da Gamba and Pochette; he claims to have revived the instrument and restored it to what it was in the reign of Queen Mary.

The cittern probably owed its popularity at this time to the ease with which it might be mastered and used to accompany the voice; it was one of the four instruments generally found in barber shops, the others being the gittern, the lute and the virginals. The customers, while waiting down the instrument from its peg and played a merry tune to pass the time.4 We read that when Konstantijn Huygens came over to England and was received by James I at Bagshot, he played to the king on the cittern (citthara), and that his performance was duly appreciated and applauded. He tells us that, although he learnt to play the barbiton in a few weeks with skill, he had lessons from a master for two years on the cittern.6 On the occasion of a third visit he witnessed the performance of some fine musicians and was astonished to hear a lady, mother of twelve, singing in divine fashion, accompanying herself on the cittern; one of these artists he calls Lanivius, the British Orpheus, whose performance was really enchanting.

Michael Praetorius7 gives various tunings for the cittern as

CITY

well as an illustration (sounded an octave higher than the notation).

During the 18th century the cittern, citra or English guitar, had twelve wire strings in six pairs of unisons tuned thus:

The introduction of the Spanish guitar, which at once leapt into favour, gradually displaced the English variety. The Spanish guitar had gut strings twanged by the fingers. The last development of the cittern before its disappearance was the addition of keys. The keyed cithara was first made by Claus & Co. of London in 1783. The keys, six in number, were placed on the left of the sound-board, and on being depressed they acted on hammers inside the sound-chest, which rising through the rose sound-hole struck the strings. Sometimes the keys were placed in a little box right over the strings, the hammers striking from above. M. J. B. Vuillaume of Paris possessed an Italian cetera (not keyed) by Antoine Stradivarius, 1700 (now in the Museum of the Conservatoire, Paris), with twelve strings tuned in pairs of unisons to E, D, G, B, C, A, which was exhibited in London in 1871.

The cittern of the 16th century was the result of certain changes which took place during the evolution of the violin from the Greek kithara (see CITHARA).

The cittern has retained the following characteristics of the archetype. (1) The derivation of the name, which after the introduction of the bow was used to characterize various instruments whose strings were twanged by fingers or plectrum, such as the harp and the rota (both known as cithara), the citola and the zither. In an interlinear Latin and Anglo-Saxon version of the Psalms, dated a.d. 700 (Brit. Mus., Vesp. A. i.), cithara is translated citran, from which it is not difficult to trace the English cithron, cittern, cithern, of the 16th century. (2) The construction of the sound-chest with flat back and sound-board connected by ribs. The pear-shaped outline was possibly borrowed from the Eastern instruments, both bowed as the rebab and twanged as the lute, so common all over Europe during the middle ages, or more probably derived from the kithara of the Greeks of Asia Minor, which had the corners rounded. These early steps in the transition from the cithara may be seen in the miniatures of the Utrecht Psalter, a unique and much-copied Carolingian MS. executed at Reims (9th century), the illustrations of which were undoubtedly adapted from an earlier psalter from the Christian East. The instruments which remained true to the prototype in outline as well as in

3 See note above. Illustration in A. J. Hopkins, Musical Instruments; Historic, Rare and Unique (Edinburgh, 1888).  

A very clear drawn cittern of the 14th century occurs in a MS. treatise on astronomy (Sloane MS. 3583, Brit. Mus.) translated from the Persian of Albumazar into Latin by Georgius Zothari Zopari Fenduli, priest and philosopher, with a prologue and numerous illustrations by his own hand; the cittern is here called giga in an inscription at the side of the drawing.

References to the cittern are plentiful in the literature of the 16th and 17th centuries. Robert Fludd describes it thus: "Cistromae quae quator tantum chordas duplicatas labet easque cupreas et ferreas de quibus aliquid dicimus quo loco." Others are given in the New English Dictionary, "Cittern," and in Godefroy's Dict. d'Acad. du dix-ix e XVe siècle (1889), l'ancien jeu de cordes d'anglais du "XVIII" e XIX siècle (K. S.)

CITY (through Fr. cié, from Lat. civitas). In the United Kingdom, strictly speaking, "city" is an honorary title, officially applied to those towns which, in virtue of some pre-eminence (e.g. as episcopal seats, or great industrial centres), have by tradition or royal charter acquired the right to the designation. In the United Kingdom the official style of "city" does not necessarily involve the possession of municipal power greater than those of the ordinary boroughs, nor indeed the possession of a corporation at all (e.g. Elly). In the United States and the British colonies, on the other hand, the official application of the term "city" depends on the kind and extent of the municipal privileges possessed by the corporations, and charters are given raising towns to the rank of cities. Both in France and England the word is used to distinguish the older and central nucleus of some of the large towns, e.g. the Cité in Paris, and the "square mile" under the jurisdiction of the lord mayor which is the "City" of London.

In common usage, however, the word implies no more than a somewhat vague idea of size and dignity, and is loosely applied to any large centre of population. Thus while, historically, the City of London is quite small, London is yet properly described as the largest city in the world. In the United States this use of the word is still more loose, and any town, whether technically a city or not, is usually so designated, with little regard to its actual size or importance.

It is clear from the above that the word "city" is incapable of any very clear and inclusive definition, and the attempt to show that historically it possesses a meaning that clearly differentiates it from "town" or "borough" has led to some controversy. As the translation of the Greek κηνος or Latin civitas it involves the ancient conception of the state or "city-state," i.e. of the state as not too large to prevent its government through the body of the citizens assembled in the agora, and is applied not to the place but to the whole body politic. From this conception both the word and its dignified connotation are without doubt historically derived. On the occupation of Gaul the Gallic states and tribes were called civitates by the Romans.

4 An oval cittern and a ghittern, side by side, occur in the beautiful 15th-century Spanish MS. known as Cantigas de Santa Maria in the Cathedral at León. For a fine facsimile in colour see marquis de Valmar, Real Acad. Esq., publ. by L. Aguado (Madrid, 1889). Reproductions in black and white in Juan F. Riano, Critical and Bibliog. Notes on Early Spanish Music (London, 1887). See also K. Schlesinger, op. cit. p. 157, p. 223, also bow-shaped citterns, figs. 155 and 156, p. 197. Cittern with woman's head, 15th century, on one of six bas-reliefs on the under parts of the seats of the choir of the Priory church, Great Malvern, reproduced in J. Carter's Ancient Sculptures, 8vo, vol. ii, pl. following p. 12. Another without a head, ibid, pl. following p. 16, from a brass monumental plate in St Margaret's, King's Lynn.

5 Historia urbsque Cosmi (Oppenheim, ed. 1617) i. 226.
and subsequently the name was confined to the chief towns of the various administrative districts. These were also the seats of the bishops. It is thus affirmed that in France from the 5th to the 15th century the name civis or cite was confined to such towns as were episcopal sees, and Du Cange (Gloss. s.v. civitae) defines that word as urbs episcopalis, and states that other towns were termed castro or oppida. How far any such distinction can be sharply drawn may be doubted. With regard to England no definite line can be drawn between those towns to which the name civis or cité is given in medieval documents and those called burgi or boroughs (see J. H. Round, Feudal England, p. 338; F. W. Maitland, Domestacy Book and After, p. 183). It was, however, maintained by Coke and Blackstone that a city is a town incorporate which is or has been the see of a bishop. It is true, indeed, that the actual sees in England all have a formal right to the title; the boroughs erected into episcopal sees by Henry VIII. thereby became “cities”; but towns such as Thetford, Sherborne and Dorchester are never so designated, though they are regularly incorporated and were once episcopal sees. On the other hand, it has only been since the latter part of the 16th century that the official style of “city” has, in the United Kingdom, been conferred by royal authority on certain important towns which were not episcopal sees, Birmingham in 1889 being the first to be so distinguished. It is interesting to note that London, besides 27 boroughs, now contains two cities, one (the City of London) on the one side, the other (the City of Westminster) included in the administrative county. For the history of the origin and development of modern city government see Borough and Commune: Medieval.

CIUDAD BOLÍVAR, an inland city and river port of Venezuela, capital of the state of Bolivar, on the right bank of the Orinoco river, 240 m. above its mouth. Pop. (1801) 11,686. It stands upon a small hill about 187 ft. above sea-level, and faces the river where it narrows to a width of less than half a mile. The city is largely built upon the hillside. It is the seat of the bishopric of Guayana (founded in 1799), and is the commercial centre of the great Orinoco basin. Among its noteworthy edifices are the cathedral, federal college, theatre, masonic temple, market, custom-house, and hospital. The mean temperature is 83°. The city has a public water-supply, a tramway line, telephone service, subslufral cable communication with Soledad near the mouth of the Orinoco, where connexion is made with the national land lines, and regular steamship communication with the lower and upper Orinoco. Previous to the revolution of 1810-3, Ciudad Bolivar ranked fourth among the Venezuelan custom-houses, but the restrictions placed upon transit trade through West Indian ports have made her a dependency of the La Guaira custom-house to a large extent. The principal exports from this region include cattle, horses, mules, tobacco, cacao, rubber, tonka beans, bitters, hides, timber and many valuable forest products. The town was founded by Mendoza in 1764 as San Tomás de la Nueva Guayana, but its location at this particular point on the river gave to it the popular name of Angostura, the Spanish term for “narrow.” This name was used until 1849, when that of the Venezuelan liberator was bestowed upon it. Ciudad Bolivar played an important part in the struggle for independence and was for a time the headquarters of the revolution. The town suffered severely in the struggle for its possession, and the political disorders which followed greatly retarded its growth.

CIUDAD DE CURA, an inland town of the state of Aragua, Venezuela, 55 m. S.W. of Caracas, near the Lago de Valencia. Pop. (1801) 12,198. The town stands in a broad, fertile valley, between the sources of streams running southward to the Guárico river and northward to the lake, with an elevation above sea-level of 1598 ft. Traffic between Puerto Cabello and the Guárico plains has passed through this town since early colonial times, and has made it an important commercial centre, from which hides, cheese, coffee, cacao and beans are sent down to the coast for export; it bears a high reputation in Venezuela for commercial enterprise. Ciudad de Cura was founded in 1730, and suffered severely in the war of independence.

CIUDAD JUÁREZ, formerly El Paso del Norte, a northern frontier town of Mexico, in the state of Chihuahua, 1223 m. by rail N.W. of Mexico City. Pop. (1893) 6017; Ciudad Juárez stands 3500 ft. above sea-level on the right bank of the Rio Grande del Norte, opposite the city of El Paso, Texas, with which it is connected by two bridges. It is the northern terminus of the Mexican Central railway, and has a large and increasing transit trade with the United States, having a custom-house and a United States consulate. It is also a military post with a small garrison. The town has a straggling picturesque appearance, a considerable part of the habitations being small adobe or brick cabins. In the fertile neighbouring district cattle are raised, and wheat, Indian corn, fruit and grapes are grown, wine and brandy being made. The town was founded in 1681-1682; its present importance is due entirely to the railway. It was the headquarters of President Juárez in 1865, and was renamed in 1885 because of its devotion to his cause.

CIUDAD PORFIRIO DÍAZ, formerly PEDRAS NEGAS, a northern frontier town of Mexico in the state of Coahuila, 1008 m. N. by W. from Mexico City, on the Rio Grande del Norte, 720 ft. above sea-level, opposite the town of Eagle Pass, Texas. Pop. (1890, estimate) 3000. An international bridge connects the two towns, and the Mexican International railway has its northern terminus in Mexico at this point. The town has an important trade in cattle with the United States; it contains a fertile district devoted to agriculture and stock-raising. Coal is found in the vicinity. The Mexican government maintains a custom-house and military post here. The town was founded in 1840.

CIUDAD REAL, a province of central Spain, formed in 1813 of districts taken from New Castle, and bounded on the N. by Toledo, E. by Albacete, S. by Jaen and Cordova and W. by Badajoz. Pop. (1900) 321,580; area, 7620 sq. m. The surface of Ciudad Real consists chiefly of a level or slightly undulating plain, with low hills in the north-east and south-west; but along the south-western frontier the Sierra de Alcudia rises in two parallel ridges on either side of the river Alcudia, and is continued in the Sierra Madrons on the east. The river Guadiana drains almost the entire province, which it traverses from east to west; only the southernmost districts being watered by tributaries of the Guadalquivir. Numerous smaller streams flow into the Guadiana, which itself divides near Herencia into two branches—the northern known as the Guiguela, the southern as the Zancara. The eastern division of Ciudad Real forms part of the region known as La Mancha, a flat, thinly-peopled plain, clothed with meagre vegetation which is often ravaged by locusts. La Mancha (q.v.) is sometimes regarded as coextensive with the whole province. Severe drought is common here, although some of the rivers, such as the Jabalon and Azuer, issue fully formed from the chalky soil, and from their very sources give an abundant supply of water to the numerous mills. Towards the west, where the land is higher, there are considerable tracts of forest.

The climate is oppressively hot in summer, and in winter the plains are exposed to violent and bitterly cold winds; while the cultivation of grain, the vine and the olive is further impeded by the want of proper irrigation, and the general barrenness of the soil. Large flocks of sheep and goats find pasture in the plains; and the swine which are kept in the oak and beech forests furnish bacon and hams of excellent quality. Coal is mined chiefly at Puertollano, lead in various districts, mercury at Almadén. There are no great manufacturing towns. The roads are insufficient and ill-kept, especially in the north-east where they form the sole means of communication; and neither the Guadiana nor its tributaries are navigable. The main railway from Madrid to Lisbon passes through the capital, Ciudad Real, and through Puertollano; farther east, the Madrid-Linares line passes through Manzanares and Valdepeñas. Branch railways also connect the capital with Manzanares, and Valdepeñas with the neighbouring town of La Calzada.

The principal towns, Alcázar de San Juan (11,499), Almadén (7375), Almodóvar del Campo (12,525), Ciudad Real (15,255), Manzanares (11,229) and Valdepeñas (23,013), are described in
CIUDAD REAL—CIVILIS

separate articles. Almagro (7074) and Daimiel (11,824), in the district of La Mancha known as the Campo de Calatrava, belonged in the later middle ages to the knightly Order of Calatrava, which was founded in 1158 to keep the Moors in check. Almagro was long almost exclusively inhabited by monks and knights, and contains several interesting churches and monasteries, besides the castle of the knights, now used as barracks. Almagro is further celebrated for its lace, Daimiel for its medicinal salts. Tomelloso (13,920) is one of the chief market towns of La Mancha. Education is very backward, largely owing to the extreme poverty which has frequently brought the inhabitants to the verge of famine. (See also CASTILE.)

CIUDAD REAL, the capital formerly of La Mancha, and since 1833 of the province described above; 107 m. S.of Madrid, on the Madrid-Badajoz-Lisbon and Ciudad Real-Manzanares railways. Pop. (1900) 15,255. Ciudad Real lies in the midst of a wide plain, watered on the north by the river Guadiana, and on the south by its tributary the Jabalon. Apart from the remnants of its 13th-century fortifications, and one Gothic church of immense size, built without aisles, the town contains little of interest; its public buildings—town-hall, barracks, churches, hospital and schools—are in no way distinguished above those of other provincial capitals. There are no important local manufactures, and the trade of the town consists chiefly in the weekly sales of agricultural produce and live-stock. Ciudad Real was founded by Alphonso X. of Castile (1252-1284), and fortified by him as a check upon the Moorish power. Its original name of Villarreal was changed to Ciudad Real by John VI. in 1420. During the Peninsular War a Spanish force was defeated here by the French, on the 27th of March 1809.

CIUDAD RODRIGO, a town of western Spain, in the province of Salamanca, situated 8 m. E. of the Portuguese frontier, on the right bank of the river Agueda, and the railway from Salamanca to Coimbra in Portugal. Pop. (1900) 8930. Ciudad Rodrigo is an episcopal see, and was for many centuries an important frontier fortress. Its cathedral dates from 1195, but was restored in the 15th century. The remains of a Roman aqueduct, the foundations of a bridge across the Agueda, and other remains, seem to show that Ciudad Rodrigo occupies the site of a Roman settlement. It was founded in the 12th century by Count Rodrigo Gonzalez, from whom its name is derived. During the Peninsular War, it was captured by the French under Marshal Ney, in 1810; but on the 19th of January 1812 it was retaken by the British under Viscount Wellington, who, for this exploit, was created earl of Wellington, duke of Ciudad Rodrigo, and marquess of Torres Vedras, in Portugal.

CIVERCHIO, VINCENZO, an early 16th-century Italian painter, born at Crema. There are altar-pieces by him at Brescia, and at Crema the altar-piece at the duomo (1509). His “Birth of Christ” is in the Brera, Milan; and at Loreto are other of his works dating from 1539 and 1540.

CIVET, or properly CIVET-CAT, the designation of the more typical representatives of the mammalian family Viverridae (see CARNIVORA). CIVET-CAT are characterized by the possession of two pouches in the neighborhood of the genital organs into which the substance known as civet is poured from the glands by which it is secreted. It has a strong musky odour, exceedingly disagreeable to those unaccustomed to it, but “when properly diluted and combined with other scents it produces a very pleasing effect, and possesses a much more floral fragrance than musk, indeed it would be impossible to imitate some flowers without it.” The African civet (Viverra civetta) is from 2 to 3 ft. in length, exclusive of the tail, which is half the length of the body, and stands from 10 to 12 in. high. It is covered with long hair, longest on the middle line of the back, where it is capable of being raised or depressed at will, of a dark-grey colour, with numerous transverse black bands and spots. In habits it is chiefly nocturnal, and by preference carnivorous, feeding on birds and the smaller quadrupeds, in pursuit of which it climbs trees, but it is said also to eat fruits, roots and other vegetable matters. In a state of captivity the civet is never completely tamed, and only kept for the sake of its perfume, which is obtained in largest quantity from the male, especially when in good condition and subjected to irritation, being scraped from the pouch with a small spoon usually twice a week. The zibeth (Viverra zibetha) is a widely distributed species extending from Arabia to Malabar, and throughout several of the larger islands of the Indian Archipelago. It is smaller than the true civet, and wants the dorsal crest. In the wild state it does great damage among poultry, and frequently makes off with the young of swine and sheep. When hunted it makes a determined resistance, and emits a scent so strong as to sicken the dogs, who nevertheless are exceedingly fond of the sport, and cannot get to pursue any other game while the stench of the zibeth is in their nostrils. In confinement, it becomes comparatively tame, and yields civet in considerable quantity. In preparing for this the market it is usually spread out on the leaves of the pepper plant in order to free it from the hairs that have become detached from the pouch. On the Malabar coast this species is replaced by V. civettina. The small Indian civet or rasse (Viverricula malaccensis) ranges from Madagascar through India to China, the Malay Peninsula, and the islands of the Archipelago. It is almost 3 ft. long including the tail, and prettily marked with dark longitudinal stripes, and spots which have a distinctly linear arrangement. The perfume, which is extracted in the same way as in the two preceding species, is highly valued and much used by the Javanese. Although this animal is said to be an expert climber it usually inhabits holes in the ground. It is frequently kept in captivity in the East, and becomes tame. Fossil remains of extinct civets are found in the Miocene strata of Europe.

CIVIDALE DEL FRIULI (anc. Forum Iulii), a town of Venetia, Italy, in the province of Udine, 10 m. E. by N. by rail from the town of Udine; 453 ft. above sea-level. Pop. (1901) town, 4143; commune, 9065. It is situated on the river Natisone, which forms a picturesque ravine here. It contains some interesting relics of the art of the 8th century. The cathedral of the 15th century contains an octagonal marble canopy with sculptures in relief, with a font below it belonging to the 8th century, but altered later. The high altar has a fine silver altar front of 1585. The museum contains various Roman and Lombard antiquities, and valuable MSS. and works of art in gold, silver and ivory formerly belonging to the cathedral chapter. The small church of S. Maria in Valle belongs to the 8th century, and contains fine decorations in stucco which probably belong to the 11th or 12th century. The fine 15th-century Ponte del Diavolo leads to the church of S. Martino, which contains an altar of the 8th century with reliefs executed by order of the Lombard king Ratchis. At Cividale were born Paulus Diaconus, the historian of the Lombards in the time of Charlemagne, and the actress Adelaide Ristori (1822-1906).

The Roman town (a municipium) of Forum Iulii was founded either by Julius Caesar or by Augustus, no doubt at the same time as the construction of the Via Iulia Augusta, which passed through the town (Udine) in a north-south direction. After the decay of Aquileia and Iulium Carnicum (Zuglio) it became the chief town of the district of Friuli and gave its name to it. The patriarchs of Aquileia resided here from 773 to 1031, when they returned to Aquileia, and finally in 1238 removed to Udine. This last change of residence was the origin of the antagonism between Cividale and Udine, which was only terminated by their surrender to Venice in 1419 and 1420 respectively.

CIVILIS, CLAUDIUS, or more correctly, JULIUS, leader of the Batavian revolt against Rome (A.D. 60-70). He was twice imprisoned on a charge of rebellion, and narrowly escaped execution. During the disturbances that followed the death of Nero, he took up arms under pretence of siding with Vespasian and induced the inhabitants of his native country to rebel. The Batavians, who had rendered valuable aid under the early emperors, had been well treated in order to attach them to the cause of Rome. They were exempt from tribute, but were obliged to supply a large number of men for the army, and the
burden of conscription and the oppressions of provincial governors were important incentives to revolt. The Batavians were immediately joined by several neighbouring German tribes, the most important of whom were the Frisians. The Roman garrisons near the Rhine were driven out, and twenty-four ships captured. Two legions under Mummium Lupercus were defeated at Castra Vetera (near the modern Xanten) and surrounded. Eight cohorts of Batavian veterans joined their countrymen, and the troops sent by Vespasian to the relief of Vetera threw in their lot with them. The result of these accession to the forces of the Batavians was a rising in Gaul. Hordeionus Flaccus was murdered by his troops (70), and the whole of the Roman forces were induced by two commanders of the Gallic auxiliaries—Julius Classicus and Julius Tutor—to revolt from Rome and join the Batavians. The whole of Gaul thus practically declared itself independent, and the foundation of a new kingdom of Gaul was contemplated. The prophetess Velleda predicted the complete success of the Batavians and the fall of the Roman Empire. But disputes broke out amongst the different tribes and rendered co-operation impossible; Vespasian, having successfully ended the civil war, called upon the Batavians to lay down his arms, and on his refusal resolved to take strong measures for the suppression of the revolt. The arrival of Petullius Cerialis with a strong force secured the Gauls and mutinous troops into submission; Cerialis was defeated at Augusta Treverorum (Trier, Trèves) and Vetera, and forced to withdraw to the island of the Batavians. He finally came to an agreement with Cerialis whereby his countrymen obtained certain advantages, and resumed amicable relations with Rome. From this time the Batavians disappear from history.

The chief authority for the history of the insurrection is Tacitus, *Historiae*, iv., v., whose account breaks off at the beginning of Cerialis’s speech to Cerialis; see also Josephus, *Bellum Judæicum*, vii. 4. There is a monograph by E. Meyer, *Der Freethiêstêr der Bataver unter Cerialis* (1856); see also Merivale, *Hist. of the Romans under the Empire*, ch. viii., p. 70; and K. Müller, *Geschichte der römischen Kaiserzeit*, bk. ii. ch. 2, § 54 (1883).

**CIVILIZATION.** The word “civilization” is an obvious derivative of the Lat. *civis*, a citizen, and *civils*, pertaining to a citizen. Etymologically speaking, then, it would be putting no undue strain upon the word to interpret it as having to do with the entire period of human progress since mankind attained sufficient intelligence and social unity to develop a system of government. But in practice “civilization” is usually interpreted in a somewhat narrower sense, as having application solely to the most recent and comparatively brief period of time that has elapsed since the most highly developed races of men have used systems of writing. This restricted usage is probably explicable, in part at least, by the fact that the word, though distinctly modern in origin, is nevertheless older than the interpretation of social evolution that now finds universal acceptance. Only very recently has it come to be understood that primitive societies vastly antedating the historical period had attained relatively high stages of development and fixity, socially and politically. Now that this is understood, however, nothing but an arbitrary and highly inconvenient restriction of meanings can prevent us from speaking of the citizens of these early societies as having attained certain stages of civilization. It will be convenient, then, in outlining the successive stages of human progress here, to include under the comprehensive term “civilization” those long earlier periods of “savagery” and “barbarism” as well as the more recent period of higher development to which the word “civilization” is sometimes restricted.

Adapted from *CIVILIZATION* by W. F. Hodge, 1943.

**Savagery and barbarism.**

A recognition of the fact that primitive man used implements of chipped flint, of polished stone, and of the softer metals for successive ages, before he attained a degree of technical skill and knowledge that would enable him to smelt iron, led the Danish archaeologists to classify the stages of human progress under these captions: the Rough Stone Age; the Age of Polished Stone; the Age of Bronze; and the Age of Iron. These terms acquired almost universal recognition, and they retain popularity as affording a very broad outline of the story of human progress. It is obviously desirable, however, to fill in the outlines of the story more in detail. To some extent it has been possible to do so, largely through the efforts of ethnologists who have studied the social conditions of existing races of savages. A recognition of the principle that, broadly speaking, progress has everywhere been achieved along the same lines and through the same sequence of changes, makes it possible to interpret the past history of the civilized races of to-day in the light of the present-day conditions of other races that are still existing under social and political conditions of a more primitive type. Such races as the Maoris and the American Indians have furnished invaluable information to the student of social evolution; and the knowledge thus gained has been extended and fortified by the ever-expanding researches of palaeontologists. Ethnologists believe that an answer can be found. They believe that the metamorphosis from beast-like savage to cultured civilian may be proximally explained (certain potentials and attributes of the species being taken for granted) as the result of accumulated changes that found their initial impulses in a half-dozen or so of practical inventions. Stated thus, the explanation seems absurdly simple. Confessedly it supplies only a proximal, not a final, analysis of the forces impelling mankind along the pathway of progress. But it has the merit of tangibility; it presents certain highly important facts of human history vividly: and it furnishes a definite and fairly satisfactory basis for marking successive stages of incipient civilization.

In outlining the story of primitive man’s advancement, upon such a basis, we may follow the scheme of one of the most philosophical of ethnologists, Lewis H. Morgan, who made a provisional analysis of the prehistoric period that still remains among the most satisfactory attempts in this direction. Morgan divides the entire epoch of man’s progress from bestiality to civilization into six successive periods, which he names respectively the Older, Middle and Later periods of Savagery, and the Older, Middle and Later periods of Barbarism.
The first of these periods, when mankind was in the lower status of savagery, comprises the epoch when articulate speech was being developed. Our ancestors of this epoch inhabited a necessarily restricted tropical territory, and subsisted upon raw nuts and fruits. They had no knowledge of the uses of fire. All existing races of men had advanced beyond this condition before the opening of the historical period.

The Middle Period of Savagery began with a knowledge of the uses of fire. This wonderful discovery enabled the developing race to extend its habitat almost indefinitely, and to include flesh, and in particular fish, in its regular dietary. Man could now leave the forests, and wander along the shores and rivers, migrating to climates less enervating than those to which he had previously been confined. Doubtless he became an expert fisher, but he was as yet poorly equipped for hunting, being provided, probably, with no weapon more formidable than a crude hatchet and a roughly fashioned spear. The primitive races of Australia and Polynesia had not advanced beyond this middle status of savagery when they were discovered a few generations ago. It is obvious, then, that in dealing with the further progress of nascent civilization we have to do with certain favoured portions of the race, which sought out new territories, and developed new capacities while many tribes of their quondam peers remained static and hence by comparison seemed to retrograde.

The next great epochal discovery, in virtue of which a portion of the race advanced to the Upper Status of Savagery, was that of the bow and arrow,—a truly wonderful implement.

The possessor of this device could bring down the swiftest animal and could defend himself against the most predatory. He could provide himself not only with food but with materials for clothing and for tent-making, and thus could migrate at will back from the seas and large rivers, and far into inhospitable but invigorating temperate and sub-Arctic regions. The meat diet, not for the first time freely available, probably contributed, along with the stimulating climate, to increase the physical vigour and courage of this highest savage, thus urging him along the paths of progress. Nevertheless many tribes came thus far and no further, as witness the Athapascans of the Hudson’s Bay Territory and the Indians of the valley of the Columbia.

We now come to the marvellous discovery that enabled our ancestor to make such advances upon the social conditions of his forbears as to entitle him, in the estimate of his remote descendants, to be considered as putting savagery behind him and as entering upon the Lower Status of Barbarism. The discovery in question had to do with the practice of the art of making pottery (see CERAMICS). Hitherto man had been possessed of no permanent utensils that could withstand the action of fire. He could not readily boil water except by some such cumbersome method as the dropping of heated stones into a wooden or skin receptacle. The effect upon his dietary of having at hand earthen vessels in which meat and herbs could be boiled over a fire must have been momentous. Various meats and many vegetables become highly palatable when boiled that are almost or quite inedible when merely roasted before a fire. Bones, sinews and even hides may be made to give up a modicum of nutriment in this way; and doubtless barbaric man, before whom starvation always threatened, found the crude pot an almost perennial refuge. And of course its use as a cooking utensil was only one of many ways in which the newly discovered mechanism exerted a civilizing influence.

The next great progressive movement, which carried man into the Middle Status of Barbarism, is associated with the domestication of animals in the Eastern hemisphere, and with the use of irrigation in cultivating the soil and even of adobe bricks and stone in architecture in the Western hemisphere. The dog was probably the first animal to be domesticated, but the sheep, the ox, the camel and the horse were doubtless added in relatively rapid succession, so soon as the idea that captive animals could be of service had been clearly conceived. Man now became a herdman, no longer dependent for food upon the precarious chase of wild animals. Milk, procurable at all seasons, made a highly important addition to his dietary. With the aid of camel and horse he could traverse wide areas hitherto impassable, and come in contact with distant peoples. Thus commerce came to play an extended role in the dissemination of both commodities and ideas. In particular the nascent civilization of the Mediterranean region fell heir to numerous products of farther Asia—gums, spices, oils, and most important of all, the cereals. The cultivation of the latter gave the finishing touch to a comprehensive and varied diet, while emphasizing the value of a fixed abode. For the first time it now became possible for large numbers of people to form localized communities. A natural consequence was the elaboration of political systems, which, however, proceeded along lines already suggested by the experience of earlier epochs. All this tended to establish and emphasize the idea of nationality, based primarily on blood-relationship; and at the same time to develop within the community itself the idea of property,—that is to say, of valuable or desirable commodities which have come into the possession of an individual through his enterprise or labor, and which he could thereafter be subject to his voluntary disposal. At an earlier stage of development, the property had been of communal, not of individual, ownership. It appears, then, that our mid-period barbarian had attained—if the verbal contradiction be permitted—a relatively high stage of civilization.

There remained, however, one master craft of which he had no conception. This was the art of smelting iron. When, ultimately, his descendants learned the wonderful secrets of that art, they rose in consequence to the Upper Status of Barbarism. This culminating practical invention, it will be observed, is the first of the great discoveries with which we have to do that was not primarily concerned with the question of man’s food supply. Iron, to be sure, has abundant uses in the same connexion, but its most direct and obvious utilities have to do with weapons of war and with implements calculated to promote such arts of peace as house-building, road-making and the construction of vehicles. Wood and stone could now be fashioned as never before. Houses could be built and cities walled with unexampled facility; to say nothing of the making of a multitude of minor implements and utensils hitherto quite unknown, or at least never so costly. Nor must we overlook the aesthetic influence of edged implements, with which wood and stone could readily be sculptured when placed in the hands of a race that had long been accustomed to scratch the semblance of living forms on bone or ivory and to fashion crude images of clay. A word, man, the “tool-making animal,” was now for the first time provided with tools worthy of his wonderful hands and yet more wonderful brain.

Thus through the application of one revolutionary invention after another, the most advanced races of men had arrived, after long ages of effort, at a relatively high stage of development. A very wide range of experiences had enabled man to evolve a complex body politic, based on a fairly secure social basis, and his brain had correspondingly developed into a relatively efficient and stable organ of thought. But as yet he had devised no means of communicating freely with other people at a distance except through the medium of verbal messages; nor had he any method by which he could transmit his experiences to posterity more securely than by fugitive and fallible oral traditions. A vague symbolization of his achievements was preserved from generation to generation among the wise men, but he knew not how to make permanent record of his history. Until he could devise a means to make such record, he must remain, in the estimate of his descendants, a barbarian, though he might be admitted to have become a highly organized and even in a broad sense a cultured being.

At length, however, this last barrier was broken. Some race or races devised a method of symbolizing events and ultimately of making even abstruse ideas tangible by means of graphic signs. In other words, a system of writing was developed. Man thus achieved a virtual conquest over time
as he had earlier conquered space. He could now transmit the record of his deeds and his thoughts to remote posterity. Thus he laid the foundation of what later generations would term the history of barbarism. He had graduated out of barbarism, and become in the narrower sense of the word a civilized being. Henceforth, his knowledge, his poetical dreams, his moral aspirations might be recorded in such form as to be read not merely by his contemporaries but by successive generations of remote posterity. The inspiring character of such a message is obvious. The validity of making this great culminating intellectual achievement the test of "civilized" existence need not be denied. But we should not comprehend the character of the message which the earlier generations of civilized beings transmit to us from the period which we term the "dawning of history" did we not bear constantly in mind the long series of progressive stages of savagery and barbarism that of necessity preceded the final stage of civilization proper. The achievements of those earlier stages afforded the secure foundation for the progress of the future. A multitude of minor arts, in addition to the important ones just outlined, had been developed; and for the first time civilized man was to make no other epochal addition to the list of accomplishments that came to him as a heritage from his barbaric progenitor. Indeed, even to this day the list of such additions is not a long one, nor, judged in the relative scale, so important as might at first thought be supposed. Whoever considers the subject carefully must admit the force of Morgan's suggestion that man's achievements as a barbarian, considered in their relation to the sum of human progress, "transcend, in relative importance, all his subsequent works."

Without insisting on this comparison, however, let us ask what discoveries and inventions man has made within the historical period that may fairly be ranked with the half-dozen great epochal achievements that have been put forward as furnishing the keys to all the progress of the prehistoric periods. In other words, let us sketch the history of progress during the ten thousand years or so that have elapsed since man learned the art of writing, adapting our sketch to the same scale which we have already applied to the unnumbered millenniums of the prehistoric period. The view of world-history thus outlined will be a very different one from what might be expected by the student of national history; but it will present the essentials of the progress of civilization in a suggestive light.

Civilization proper.

Without pretending to fix an exact date,—which the historical records do not at present permit,—we may assume that the most advanced race of men elaborated a system of writing not less than six thousand years before the beginning of the Christian era. Holding to the terminology already suggested for the earlier periods, we may speak of man’s position during the ensuing generations as that of the First or Lowest Status of civilization. If we review the history of this period we shall find that it extended over a stretch of at least four thousand years. During the early part of this period such localized civilizations as those of the Egyptians, the Semites, the Babylonians and the Hittites rose, grew strong and passed beyond their meridian. This suggests that we must now admit the word "civilization" to yet another definition, within its larger meaning; we must speak of "a civilization," as that of Egypt, of Babylon, of Assyria, and we must understand thereby a localized phase of society bearing the same relation to civilization as a whole that a wave bears to the ocean or a tree to the forest. Such other localized civilizations as those of Phoenicia, Carthage, Greece, Rome, Byzantium, the Sassanids, in due course waxed and waned, leaving a tremendous imprint on national history, but creating only minor and transitory ripples in the great ocean of civilization. Progress in the elaboration of the details of earlier methods and inventions took place as a matter of course. Some nation, probably the Phoenicians, gave a new impetus to the art of writing by developing a phonetic alphabet; but this achievement, remarkable as it was in itself, added nothing fundamental to human capacity. Literatures had previously flourished through the use of hieroglyphic and syllabic symbols; and the Babylonian syllabaries continued in vogue throughout western Asia for a long time after the Phoenician alphabet had demonstrated its intrinsic superiority.

Similarly the art of Egyptian and Assyrian and Greek was but the elaboration and perfection of methods that barbaric man had practised away back in the days when he was a cave-dweller. The weapons of warfare of Greek and Roman were the spear and bow and arrow that their ancestors had used in the period of savagery, aided by sword and helmet dating from the upper period of barbarism. Greek and Roman civilization at their best were founded upon the system of gens that barbaric man had profusely studied,—as witness, for example, the federal system of the barbaric Iroquois Indians existing in America before the coming of Columbus. And if the Greeks had better literature, the Romans better roads and larger cities, than their predecessors, these are but matters of detailed development, the like of which had marked the progress of the more important arts and the introduction of less important ancillary ones in each antecedent period. The axe of steel is no new implement, but a mere perfecting of the axe of chipped flint. The Iliad represents the perfecting of an art that unnumbered generations of barbarians practised before their camp-fires.

Thus for six or seven thousand years after man achieved civilization there was rhythmic progress in many lines, but there came no great epochal invention to usher in a new ethnic period. Then, towards the close of what historians of to-day are accustomed to call the middle ages, there appeared in rapid sequence three or four inventions and a great scientific discovery that, taken together, were destined to change the entire aspect of European civilization. The inventions were gunpowder, the mariner's compass, paper and the printing-press, three of which appear to have been brought into Europe by the Moors, whether or not they originated in the remote East. The scientific discovery which must rank with these inventions was the Copernican demonstration that the sun and not the earth is the centre of our planetary system. The generations of men that found themselves (1) confronted with the revolutionary conception of the universe given by the Copernican theory; (2) supplied with the new means of warfare provided by gunpowder; (3) equipped with an undreamed-of guide across the waters of the earth; and (4) enabled to promulgate knowledge with unexampled speed and cheapness through the aid of paper and printing-press—such generations of men might well be said to have entered upon a new ethnic period. The transition in their mode of thought and in their methods of practical life was as great as can be supposed to have resulted, in an early generation, from the introduction of iron, or in a yet earlier from the invention of the bow and arrow. So the Europeans of about the 15th century of the Christian era may be said to have entered upon the Second or Middle Status of civilization.

The one period was destined to be a brief one. It had compassed only about four hundred years when, towards the close of the 18th century, James Watt gave to the world the perfected steam-engine. Almost contemporaneously, assiduously Arkwright and Hargreaves developed revolutionizing processes of spinning and weaving by machinery. Meantime James Hutton and William Smith and their successors on the one hand, and Erasmus Darwin, François Lamarck, and (a half-century later) Charles Darwin on the other, turned men's ideas topsy-turvy by demonstrating that the world as the abiding-place of animals and man is enormously old, and that man himself instead of deteriorating from a single perfect pair six thousand years removed, has ascended from bestiality through a slow process of evolution extending over hundreds of centuries. The revolution in practical life and in the mental life of our race that followed these inventions and this new presentation of truth probably exceeded in suddenness and in its far-reaching effects the metamorphosis effected at any previous transition from one ethnic period to another. The men of the 19th century, living now in the period that may be termed the Upper Status...
of civilization, saw such changes as we have noticed in the practical affairs of their everyday lives as had been wrought before during the entire historical period. Their fathers had travelled in vehicles drawn by horses, quite as their remoter ancestors had done since the time of higher barbarism. It may be doubted whether there existed in the world in the year 1800 a postal service that could compare in speed and efficiency with the express service of the Romans of the time of Caesar; far less was there a telegraph service that could compare with that of the ancient Persians. Nor was there a ship sailing the seas that a Phoenician trireme might not have outmatched. But now within a single lifetime of a single man the world was covered with a network of steel rails on which locomotives of gigantic proportions, laden with passengers at an hourly speed almost equalling Caesar's best journey of a day; over the land and under the seas were stretched wires across which messages traveled from continent to continent literally with the speed of lightning; and the waters of the earth were made to teem with gigantic craft propelled without sail or oar at a speed which the Phoenician captain of three thousand years ago and the English captain of the 18th century would alike have held incredible.

There is no need to give further details here of the industrial revolutions that have been achieved in this newest period of civilization, since in their broader outlines at least they are familiar to every one. Nor need we dwell upon the revolution in thought whereby man has for the first time been given a clear inkling as to his origin and destiny. It suffices to point out that such periods of fermentation of ideas as this suggest have probably always been concomitant with those outbursts of creative genius that gave the world the practical inventions upon which human progress has been conditioned. The same attitude of receptivity to new ideas is pre-requisite to one form of discovery as to the other. Nor, it may be added, can either form of idea become effective for the progress of civilization except in proportion as a large body of any given generation are prepared to receive it. Doubtless here and there a dreamer played with fire, in a literal sense, for generations before the utility of fire as a practical aid to human progress came to be recognized in practice. And—seeking an illustration at the other end of the scale—we know that the advanced thinkers of Greece and Rome believed in the antiquity of the earth and in the evolution of man two thousand years before the coming of Darwin. We have but partly solved the mysteries of the progress of civilization, then, when we have pointed out that each tangible stage of progress owed its initiative to a new invention or discovery of science. To go to the root of the matter we must needs explain how it came about that a given generation of men was in mental mood to receive the new invention or discovery.

The pursuit of this question would carry us farther into the realm of communal and racial psychology— to say nothing of the realm of conjecture—that comports with the purpose of this article. It must suffice to point out that alertness of mind that all men pass through, a reaction to the influences of the environment. It follows that man may subject himself to new influences and thus give his mind a new stimulus by changing his habitat. A fundamental secret of progress is revealed in this fact. Man probably never would have evolved from savagery had he remained in the Tropics where he doubtless originated. But successive scientific inventions enabled him, as has been suggested, to migrate to distant latitudes, and thus more or less involuntarily to become the recipient of new creative and progressive impulses. After migrations in many directions has resulted in the development of divers races, each with certain capacities and acquirements due to its unique environment, there was opportunity for the application of the principle of environmental stimulus in an indirect way, through the mingling and physical intermixture of one race with another. Each of the great localized civilizations of antiquity appears to have owed its prominence in part at least—perhaps very largely—to such intermingling of two or more races. Each of these civilizations began to decay so soon as the nation had remained for a considerable number of generations in its localized environment, and had practically ceased to receive accretions from distant races at approximately the same stage of development. There is a suggestive lesson for present-day civilization in that thought-compelling fact. Further evidence of the application of the principle of environmental stimulus, operating through changed habitat and racial intermixture, is furnished by the vitality of the colonial peoples of our own day. The receptiveness to new ideas and the rapidity of material progress of Americans, South Africans and Australians is proverbial. No one doubts, probably, that one or another of these countries will give a new stimulus to the progress of civilization, through the promulgation of some great epochal discovery, in the not distant future. Again, the value of racial intermingling is shown yet nearer home in the long-continued vitality of the British nation, which is explicable, in some measure at least, by the fact that the Celtic element held aloof from the Anglo-Saxon element century after century sufficiently to maintain racial integrity, yet mingled sufficiently to give and receive the fresh stimulus of "new blood." It is interesting in this connection the birthplaces of the men named above as being the originators of the inventions and discoveries that made the close of the 18th century memorable as ushering in a new ethnic era. It may be added that these names suggest yet another element in the causation of progress: the fact, namely, that, however necessary racial receptivity may be to the dynamic upheaval of a new ethnic era, it is after all individual genius that applies its detonating spark.

Without further elaboration of this aspect of the subject it may be useful to recapitulate the analysis of the evolution of civilization above given, prior to characterizing it from another standpoint. It appears that the entire period of human progress up to the present may be divided into nine periods which, if of necessity more or less arbitrary, yet are not without certain warrant of logic. They may be defined as follows: (1) The Lower Period of Savagery, terminating with the discovery and application of the uses of fire. (2) The Middle Period of Savagery, terminating with the invention of the bow and arrow. (3) The Upper Period of Savagery, terminating with the invention of pottery. (4) The Lower Period of Barbarism, terminating with the domestication of animals. (5) The Middle Period of Barbarism, terminating with the discovery of the process of smelting iron ore. (6) The Upper Period of Barbarism, terminating with the development of a system of writing as well as the requirements of literary composition. (7) The First Period of Civilization (proper) terminating with the introduction of gunpowder. (8) The Second Period of Civilization, terminating with the invention of a practical steam-engine. (9) The Upper Period of Civilization, which is still in progress, but which, as will be suggested in a moment, is probably nearing its termination.

It requires but a glance at the characteristics of these successive epochs to realize how the ever-increasing complexity of the inventions that delimit them is conditioned and limited by the conditions of life that they connote. Were we to attempt to characterize in a few phrases the entire story of achievement thus outlined, we might say that during the three periods of Savagery man was attempting to make himself master of the geographical climates. His unconscious ideal was, to gain a foothold and the means of subsistence in every zone. During the three periods of Barbarism the ideal of conquest was extended to the beasts of the field, the vegetable world, and the mineral contents of the earth's crust. During the three periods of Civilization proper the ideal of conquest has become still more intellectual and subtle, being now extended to such abstractions as an analysis of speech-sounds, and to such intangibles as expanding gases and still more elusive electric currents: in other words, to the forces of nature, no less than to tangible substances. Hand in hand with this growing complexity of man's relations with the external world has gone a like increase of complexity in the social and political organizations that characterize man's relations with his fellow-
men. In savagery the family expanded into the tribe; in barbarism the tribe developed into the nation. The epoch of civilization proper is aptly named, because it has been a time in which citizenship, in the narrower national significance, has probably been developed to its apogee. Throughout this period, in every land, the highest virtue has been considered to be patriotism,—by which must be understood an instinctive willingness on the part of every individual to defend even with his life the interests of the nation into which he chances to be born, regardless of whether the national cause in which he struggles be in any given case good or bad, right or wrong. The communal judgment of this epoch pronounces any man a traitor who will not uphold his own nation even in a wrong cause—and the word "traitor" marks the utmost brand of ignominy.

But while the idea of nationality has thus been accentuated, there has been a never-ending struggle within the bounds of the nation itself to adjust the relations of one citizen to another. The ideas that might make right, that the strong man must dominate the weak, that leadership in the community properly belongs to the man who is physically most competent to lead—these ideas were but imperfectly natural, and indeed an inevitable, outgrowth of the conditions under which man fought his way up through savagery and barbarism. Man in the first period of civilization inherited these ideas, along with the conditions of society that were their concomitants. So throughout the periods when the oriental civilizations of Egypt and Babylonia and Assyria and Persia were dominant, a despotic form of government was accepted as the natural order of things. It does not appear that any other form was even considered as a practicality. A despot might indeed be overthrown, but only to make way for the coronation of another despot. A little later the Greeks and Romans modified the conception of a heaven-sent individual monarch; but they went no further than to substitute a heaven-favored community, with specially favored groups (Patricii) within the community. With this, national egoism reached its climax; for each people regarded its own citizens as the only exemplars of civilization, openly branding all the rest of the world as "barbarians," fit subjects for the exaction of tribute or for the imposition of the bonds of actual slavery. During the middle ages there was a reaction towards individualism as opposed to nationalism: but the entire system of feudalism, with its clearly recognized conditions of over-lordship and of vassalage, gave expression, no less clearly than oriental despotism and classical "democracy" had done, to the idea of individual inequality; of divergence of moral and legal status based on natural inheritance. Thus this idea, a reminiscence of barbarism, maintained its dominance throughout the first period of civilization.

But gunpowder, marking the transition to the second period of civilization, came as a great levelling influence. With its aid the weakest peasant might prove more than a match for the most powerful knight. Before its assaults the castle of the lord ceased to be an impregnable fortress. And while gunpowder thus levelled down the pride of the magnate, the printing-press levelled up the proud of the multitude, and hence the power and influence of the lowly. Meantime the mariner's compass opened up new territories beyond the seas, and in due course men of lowly origin were seen to attain to wealth and power through commercial pursuits, thus tending to break in upon the established social order. In the colonial territories themselves all men were subjected more or less to the same perils and dependent upon their own efforts. Success and prominence in the community came not as a birthright, but as the result of demonstrated fitness. The great lesson that the interests of all members of a community are, in the last analysis, mutual could be more clearly distinguished in these small colonies than in larger and older bodies politic. Through various channels, therefore, in the successive generations of this middle period of civilization, the idea gained ground that intelligence and moral worth, rather than physical prowess, should be the test of greatness; that it is incumbent on the strong in the interests of the body politic to protect the weak; and that, in the long run, the best interests of the community are conserved if all its members, without exception, are given moral equality before the law. This idea of equal rights and privileges for all members of the community—for each individual "the greatest amount of liberty consistent with a like liberty of every other individual"—first found expression as a philosophical doctrine towards the close of the 18th century; at which time also tentative efforts were made to put it into practice. It may be said therefore to represent the culminating sociological doctrine of the middle period of civilization,—the ideal towards which all the influences of the period had tended to impel the race.

It will be observed, however, that this ideal of individual equality within the body politic in no direct way influences the status of the body politic itself as the centre of a localized civilization that may be regarded as in a sense antagonistic to all other similarly localized civilizations. If there were any such influence, it would rather operate in the direction of accentuating the patriotism of the member of a democratic community, as against that of the subject of a despot, through the sense of personal responsibility developed in the former. The developments of the middle period of civilization cannot be considered, therefore, as having tended to decrease the spirit of nationality, though its concomitant petty localism is called provincialism. The history of this entire period, as originally presented, is largely made up of the records of international rivalities and jealousies, perniciously culminating in bitterly contested wars. It was only towards the close of the epoch that the desirability of free commercial intercourse among nations began to find expression as a philosophical creed through the efforts of Quesnay and his followers; and the doctrine that both parties to an international commercial transaction are gainers thereby found its first clear expression in the year 1776 in the pages of Condillac and of Adam Smith.

But the discoveries that ushered in the third period of civilization were destined to work powerfully from the outset for the breaking down of international barriers, though, of course, their effects would not be at once manifest. Thus the substitution of steam power for water power, besides giving a tremendous impetus to manufacturing in general, mapped out new industrial centers in regions that nature had supplied with coal but not always with other raw materials. To note a single result, England became the manufacturing centre of the world, drawing its raw materials from every corner of the globe; but in so doing it ceased to be self-supporting as regards the production of food-supplies. While growing in national wealth, as a result of the new inventions, England has therefore lost immeasurably in national self-sufficiency and independence; having become in large measure dependent upon other countries both for the raw materials without which her industries must perish and for the foods to maintain the very life of her people.

What is true of England in this regard is of course true in greater or less measure of all other countries. Everywhere, thanks to the new mechanisms that increase industrial efficiency, there has been an increasing tendency to specialization; and since the manufacturer must often find his raw materials in one part of the world and his market in another, this implies increasing intercommunication and interdependence between the nations. This is one of the most marked new means of transportation by locomotive and steamship, and by the electric communication that enables the Londoner, for example, to transact business in New York or in Tokio with scarcely an hour's delay; and that puts every one in touch at to-day's breakfast table with the happenings of the entire world. Thanks to the new mechanisms, national isolation is no longer possible; globe-trotting has become a habit with thousands of individuals of many nations; and Or'ent and Occident, representing civilizations that for thousands of years were almost absolutely seceded and mutually oblivious of each other, have been brought again into close touch for mutual education and betterment. The Western mind has learned with amazement that the aforetime Terra Incognita of the far East has nurtured a gigantic civilization having ideals in many ways different from our own. The Eastern mind has proved itself capable, in
self-defence, of absorbing the essential practicalities of Western civilization within a single generation. Some of the most important problems of world-civilization of the immediate future hinge upon the mutual relations of these two long-severed communities, branched at some early stage of progress to opposite hemispheres of the globe, but now brought by the new mechanisms into daily and even hourly communication.

While the new conditions of the industrial world have thus tended to develop a new national outlook, there has come about, as a result of the scientific discoveries already referred to, a no less significant broadening of the mental and spiritual horizons. Here also the trend is away from the narrowly egoistic and towards the cosmopolitan view. About the middle of the 19th century Dr. Pritchard declared that many people debated whether it might not be permissible for the Australian settlers to shoot the natives as food for their dogs; some of the disputants argued that savages were without the nai of human brotherhood and that these thinkers, and all mankind are one brotherhood, needs no defense. The most primitive of existing aborigines are regarded merely as brethren who, though some defect or neglect of opportunity, have lagged behind in the race. Similarly the defective and criminal classes that make up so significant a part of the population of even our highest present-day civilizations, are no longer regarded with anger or contempt, as beings who are suffering just punishment for wilful transgressions, but are considered as pitiful victims of hereditary and environmental influences that they could neither choose nor control. Insanity is no longer thought of as demonic possession, but as the most lamentable of diseases.

The changed attitude towards savage races and defective classes affords tangible illustrations of a fundamental transformation of point of view which doubtless represents the most important result of the operation of new scientific knowledge in the course of the 19th century. It is a transformation that is only partly understood as yet, to be be seen in every branch of learning, and when fully achieved it will represent, probably, the most radical metamorphosis of mental view that has taken place in the entire course of the historical period. The essence of the new view is this: to recognize the universality and the invariability of natural law; stated otherwise, to understand that the word "supernatural" involves a contradiction of terms and has in fact no meaning. Whoever has grasped the full import of this truth is privileged to sweep mental horizons wider by far than ever opened to the view of any thinker of an earlier epoch. He is privileged to forecast, as the sure heritage of the future, a civilization freed from the last ghost of superstition—an Age of Reason in which man shall at last find refuge from the hosts of occult and invisible powers, the fearsome galaxies of deities and demons, which have haunted him thus far at every stage of his long journey through savagery, barbarism, and early civilization; a period in which every thinker, even in the barbaric eras, may have realized that these gods that so influenced the everyday lives of his fellows were but children of the imagination. But the certainty that such is the case could not have come with the force of demonstration even to the most clear-sighted thinker until 19th-century science had investigated with penetrating vision the realm of molecule and atom; had revealed the awe-inspiring principle of the conservation of energy; and had offered a comprehensive explanation of the evolution of one form of life from another, from monad to monad, that did not presuppose the intervention of powers more "supernatural" than those that operate about us everywhere to-day.

The stupendous import of these new truths could not, of course, make itself evident to the generality of mankind in a single generation, when opposed to superstitions of a thousand genera and standing. But the new knowledge has made its way more expeditiously than could have been anticipated; and its effects are seen on every side, even where its agency is scarcely recognized. As a single illustration, we may note the familiar observation that the entire complexion of orthodox teaching of religion has been more altered in the past fifty years than in two thousand years before. This of course is not entirely due to the influence of physical and biological science; nor does it change, in the complex sociological scheme. Archaeology, comparative philology and textual criticism have also contributed their share; and the comparative study of religions has further tended to broaden the outlook and to make for universalism, as opposed to insularity, of view. It is coming to be more and more widely recognized that all theologies are but the reflex of the more or less faulty knowledge of the times in which they originate, that the true and abiding purpose of religion should be the practical betterment of humanity—the advancement of civilization in the best sense of the word; and that this end may perhaps be best subserved by different systems of theology, adapted to the varied genius of different times and divers races. Wherefore there is not the same enthusiastic desire to-day that found expression a generation ago, to impose upon the cultured millions of the East a religion that seems to them alien to their manner of thought, unsuited to their needs and less distinctly ethical in teaching than their own religions.

Such are but a few of the illustrations that might be cited from many fields to suggest that the mind of our generation is becoming receptive to a changed point of view that augurs the coming of a new ethnic era. If one may be permitted to enter very tentatively the field of prophecy, it seems not unlikely that the great revolutionary invention which will close the third period of civilization and usher in a new era is already being evolved. If it seems not over-hazardous to predict that the air-ships, in one form or another, is destined to be the mechanism that will give the new impetus to human civilization; that the next era will have as one of its practical ideals the conquest of the air; and that this conquest will become a factor in the final emergence of humanity from the insularity of nationalism to the broad view of cosmopolitanism, towards which, as we have seen, the tendencies of the present era are verging. That the gap to be bridged in this vast transition will be immensely greater than the gap that was once bridged by the discovery that the civilized nations of Europe, together with America and Japan, are at present accustomed to spend more than three hundred million pounds each year merely that they may keep armaments in readiness to fly at one another's throats should occasion arise. Formidable as these armaments now seem, however, the developments of the not very distant future will probably make them quite obsolete; and sooner or later, as science develops yet more deadly implements of destruction, the time must come when communal intelligence will rebel at the suicidal folly of the international attitude that characterized, for example, the opening decade of the 20th century. At some time, after the first period of cosmopolitanism shall be ushered in as a tenth ethnic period, it will come to be recognized that there is a word fraught with fuller meanings even than the word patriotism. That word is humanitarianism. The enlightened generation that realizes the full implications of that word will doubtless marvel that their ancestors of their third period of civilization should have risen up as nations and slaughtered one another by thousands to settle a dispute about a geographical boundary. Such a procedure will appear to have been quite as barbarous as the cannibalistic practices of their yet more remote ancestors, and distinctly less rational, since cannibalism might sometimes save its practiser from starvation, whereas warfare of the civilized type was a purely destructive agency.

Equally obvious must it appear to the cosmopolitan of some generation of the future that quality rather than mere numbers must determine the efficiency of any given community. Race suicide will then cease to be a bugbear; and it will no longer be considered rational to keep up the census at the cost of propagating low orders of intelligence, to feed the ranks of paupers, defectives and criminals. On the contrary it will be thought fitting that man should become the conscious arbiter of his own racial destiny to the extent of applying whatever laws of heredity he knows or may acquire in the interests of his own species, as he has long applied them in the case of domesticated animals. The survival and procreation of the unit will then cease to be a menace to the progress of civilization. It does not follow that
all men will be brought to a dead level of equality of body and mind, nor that individual competition will cease; but the average physical mental status of the race will be raised immeasurably through the virtual elimination of that vast company of defectives which to-day constitutes so threatening an obstacle to racial progress. There are millions of men in Europe and America to-day whose whole mental equipment—despite the fact that they have been taught to read and write—far more closely akin to the average of the Upper Period of Barbarism than to the highest standards of their own time; and these undeveloped or atavistic persons have on the average more offspring than are produced by the more highly cultured and intelligent among their contemporaries. "Race suicide" is thereby prevented, but the progress of civilization is no less surely handicapped. We may well believe that the cosmopolite of the future, aided by science, will find rational means to remedy this strange illogicality. In so doing he will exercise a more consciously purposeful function, and perhaps a more directly potent influence, in determining the line of human progress than he has hitherto attempted to assume, notwithstanding the almost infinitely varied character of the experiments through which he has worked his way from savage to civilization.

All these considerations tend to define yet more clearly the ultimate goal towards which the progressive civilization of past and present appears to be tending. The contemplation of this goal brings into view the outlines of a vastly suggestive evolutionary cycle. For it appears that the social condition of cosmopolite man, so far as the present-day view can predict it, will represent a state of things, magnified to world-dimensions, that was curiously adumbrated by the social system of the earliest savage. At the very beginning of the journey through savagery, mankind, we may well believe, consisted of a limited tribe, representing no great range or variety of capacity, and an almost absolute identity of interests. Thanks to this community of interests,—which was fortified by the recognition of blood-relationship among all members of the tribe,—a principle which we now define as "the greatest ultimate good to the greatest number" found practical, even if unwitting, recognition; and therein lay the germ of all the moral development of the future. But obvious identity of interests could be recognized only so long as the tribe remained very small; since its numbers became large, patent diversities of interest, based on individual selfishness, must appear, to obscure the larger harmony. And as savage man migrated bither and thither, occupying new regions and thus developing new tribes and ultimately a diversity of "races," all idea of community of interests, as between race and race, must have been absolutely banished. It was the obvious and patent fact that each race was more or less at rivalry, in disarray, with all the others. In the hard struggle for subsistence, the expansion of one race meant the downfall of another. So far as any principle of "the greatest good" remained in evidence, it applied solely to the members of one's own community, or even to one's particular phratry or gens.

Barbaric man, thanks to his conquest of animal and vegetable nature, was able to extend the size of the unified community, and hence to develop through diverse and intricate channels the application of the principle of "greatest good" out of which the idea of right and wrong was elaborated. But quite as little as the savage did he think of extending the application of the principle beyond the bounds of his own race. The laws which he gave expression to his ethical conceptions applied, of necessity, to his own people alone. The gods with which his imagination peopled the world were local in habitat, devoted to the interests of his race only, and at enmity with the gods of rival peoples. As between nation and nation, the only principle of ethics that ever occurred to him was that might makes right. Civilized man for a long time advanced but slowly upon this view of international morality. No Egyptian or Babylonian or Hebrew or Greek or Roman ever hesitated to attack a weaker nation on the ground that it would be wrong to do so. And few indeed are the instances in which even a modern nation has judged an international question on any other basis than that of self-interest. It was not till towards the close of the 19th century that an International Peace Conference gave tangible witness that the idea of fellowship of nations was finding recognition; and in the same recent period history has recorded the first instance of a powerful nation vanquishing a weaker one without attempting to exact at least an "indemnifying" tribute.

But the citizen of the future, if the auguries of the present prove true, will be able to apply principles of right and wrong without reference to national boundaries. He will understand that the interests of the entire human family are, in the last analysis, common interests. The census through which he attempts to estimate "the greatest good of the greatest number" must include, not his own nation merely, but the remotest member of the human race. On this universal basis must be founded that absolute standard of ethics which will determine the relations of cosmopolite man with his fellows. When this ideal is attained, mankind will again represent a single family, as it did in the day when our primeval ancestors first entered on the pathway of progress; but it will be a family whose habitat has been extended from the narrow glade of some tropical forest to the vast universe which has already been conquered by the pen of the most remoter member of this family will be permitted to enjoy the greatest amount of liberty consistent with the like liberty of every other member; but the interests of the few will everywhere be recognized as subservient to the interests of the many, and such recognition of mutual interests will establish the practical criterion for the interpretation of international affairs.

But such an extension of the altruistic principle by no means presupposes the elimination of egoistic impulses—of individualism. On the contrary, we must suppose that man at the highest stages of culture will be, even as was the savage, a seeker after the greatest attainable degree of comfort for the least necessary expenditure of energy. The pursuit of this ideal has been from first to last the ultimate compelling force in nature urging man forward. The only change has been a change in the interpretation of the ideal, an altered estimate as to what manner of things are most worth the purchase-price of toil and self-denial. That the things most worth the having cannot, generally speaking, be secured without such toil and self-denial, is a lesson that began to be inculcated while man was a savage, and that has never ceased to be reiterated generation after generation. It is the final test of progressive civilization that a given effort shall produce a larger and larger medium of average individual comfort. That is why the great inventions that have increased man's efficiency as a worker have been the necessary prerequisites to racial progress. Stated otherwise, that is why the industrial factor is everywhere the most powerful factor in civilization; and why the economic interpretation is the most searching interpretation of history at its every stage. It is the basal fact that progress implies increased average working efficiency—a growing ratio between average effort and average achievement—that gives sure warrant for such a prognostication as has just been attempted concerning the future industrial unification of our race. The efforts of civilized man provide him, on the average, with a marvellous range of comforts, as contrasted with those that rewarded the most strenuous efforts of savage or barbarian, to whom present-day necessaries would have been undreamed-of luxuries. But the ideal ratio between effort and result has by no means been achieved; nor will it have been until that speculative brain of man has provided a civilization in which a far higher percentage of citizens will find the life-vocations to which they are best adapted by nature, and in which, therefore, the efforts of the average worker may be directed with such vigour, enthusiasm and interest as can alone make for true efficiency; a civilization adjusted to such an economic balance that the average man may live in reasonable comfort without heart-breaking strain, and yet accumulate a sufficient surplus to ensure ease and serenity for his declining days. Such, seemingly, should be the normal goal of progressive civilization. Doubtless mankind in advancing towards that goal will institute many changes that could by no possibility be
is applied par excellence to the system of law created by the genius of the Roman people, and handed down by them to the nations of the modern world (see ROMAN LAW). The civil law in this sense would be distinguished from the local or national law of modern states. The civil law in this sense is further to be distinguished from that adaptation of its principles to ecclesiastical purposes which is known as the canon law (q.v.).

CIVIL LIST, the English term for the account in which are contained all the expenses immediately applicable to the support of the British sovereign's household and the honour and dignity of the crown. An annual sum is settled by the British parliament at the beginning of the reign on the sovereign, and is charged on the consolidated fund. But it is only from the reign of William IV. that the sum thus voted has been restricted solely to the personal expenses of the crown. Before his accession many charges properly belonging to the ordinary expenses of government had been placed on the civil list. The history of the civil list dates from the reign of William and Mary. Before the Revolution no distinction had been made between the expenses of government in time of peace and the expenses relating to the personal dignity and support of the crown. The revenues derived from the hereditary revenues of the crown, and the surplus voted for life to the king at the beginning of each reign, were supposed to provide for the support of the sovereign's dignity and the civil government, as well as for the public defence in time of peace. Any saving made by the king in the expenditure touching the government of the country or its defence would go to swell his private purse. But with the Revolution a step forward was made towards the establishment of the principle that the expenses relating to the support of the crown should be separated from the ordinary expenses of the state. The evils of the old system under which no appropriation was made of the ordinary revenue granted to the crown for life had been manifest in the reigns of Charles II. and James II.; it was their control of these large revenues that made them so independent of parliament. Moreover, while the civil government and the defence suffered, the king could use these revenues as he liked. The parliament of William and Mary fixed the revenue of the crown in time of peace at £1,200,000 per annum; of this sum about £700,000 was appropriated to the "civil list." But from this the sovereign was to defray the expenses of the civil service and the payment of pensions, as well as the cost of the support of the royal household and his own personal expenses. It was from this that the term "civil list" arose, to distinguish it from the statement of military and naval charges. The revenue voted to meet the civil list consisted of the hereditary revenues of the crown and a part of the excise duties. Certain changes and additions were made in the sources of revenue thus appropriated between the reign of William and Mary and the accession of George III., when a different system was adopted. Generally speaking, however, the sources of revenue remained as settled at the Revolution.

Anne had the same civil list, estimated to produce an annual income of £700,000. During her reign a debt of £1,200,000 was incurred. This debt was paid by parliament and charged on the civil list itself. George I. enjoyed the same revenue by parliamentary grant, in addition to an annual sum of the aggregate fund. A debt of £1,000,000 was incurred, and discharged by parliament in the same manner as Anne's debt had been. To George II. a civil list of £800,000 as a minimum was granted, parliament undertaking to make up any deficiency if the sources of income appropriated to its service fell short of that sum. Thus in 1746 a debt of £45,000 was paid by parliament on the civil list. On the accession of George III. a change was made in the system of the civil list. Hitherto the sources of revenue appropriated to the service of the civil list had been settled on the crown. If these revenues exceeded the sum they were computed to produce annually, the surplus went to the king. George III., however, surrendered the life-interest in the hereditary revenues and the excise duties hitherto voted to defray...
the civil list expenditure, and any claim to a surplus for a fixed amount. The king still retained other large sources of revenue which were not included in the civil list, and were free from the control of parliament. The revenues from which the civil list had been defrayed were henceforward to be carried into, and made part of, the aggregate fund. In their place a fixed civil list was granted—at first of £723,000 per annum, to be increased to £800,000 on the falling in of certain annuities to members of the royal family. From this £800,000 the king’s household and the honour and dignity of the crown were to be supported, as well as the civil service offices, pensions and other charges still laid on the list.

During the reign of George III. the civil list played an important part in the history of the struggle on the part of the king to establish the royal ascendency. From the revenue appropriated to its service came a large portion of the money employed by the king in creating places and pensions for his supporters in parliament, and, under the colour of economic reform, bribers was practised on a large scale. No limit was set to the amount applicable to the pensions charged on the civil list, so long as the sum granted could meet the demand; and there was no principle on which the grant was regulated. Secret pensions at the king’s pleasure were paid out of it, and in every way the independence of parliament was menaced; and though the more legitimate expenses of the royal household were diminished by the king’s penurious style of living, and though many charges not directly connected with the king’s personal expenditure were removed, the amount was constantly exceeded, and applications were made from time to time to parliament to pay off debts incurred; and thus opportunity was given for criticism. In 1769 a debt of £513,511 was paid off in arrear; and in spite of the demand for accounts and for an inquiry into the cause of the debt, the ministry succeeded in securing this vote without granting such information. All attempts to investigate the matter were unsuccessful, though Lord Chatham went so far as to declare himself convinced that the funds were expended in corrupting members of parliament. Again, in 1777, an application was made to parliament to pay off £618,340 of debts; and in view of the growing discontent Lord North no longer dared to withhold accounts. Yet, in spite of strong opposition and free criticism, not only was the amount voted, but also a further £100,000 per annum, thus raising the civil list to an annual sum of £900,000.

In 1779, at a time when the expenditure of the country and the national debt had been enormously increased by the American War, the general dissatisfaction found voice in parliament, and the abuses of the civil list were specially singled out for attack. Many petitions were presented to the House of Commons praying for its reduction, and a motion was made in the House of Lords in the same sense, though it was rejected. In 1780 Burke brought forward his scheme of economic reform, but his name was already associated with the growing desire to remedy the evils of the civil list by the publication in 1779 of his pamphlet on “The Causes of the Present Discontent.” In this scheme Burke freely animadverted on the profusion and abuse of the civil list, criticizing the useless and obsolete offices and the offices performed by deputy. In every department he discovers jobbery, waste and peculation. His proposal was that the many offices should be reduced and consolidated, that the pension list should be brought down to a fixed sum of £600,000 per annum, and that pensions should be confined only to reward merit or fulfill real public charity. All pensions were to be paid at the exchequer. He proposed also that the civil list should be divided into classes, an arrangement which later was carried into effect. In 1780 Burke succeeded in bringing in his Establishment Bill, but though at first it met with considerable support, and was even read a second time, Lord North’s government defeated it in committee. The next year the bill was again introduced into the House of Commons, and Pitt made his first speech in its favour. The bill was, however, lost on the second reading.

In 1782 the Rockingham ministry, pledged to economic reform, came into power; and the Civil List Act 1782 was introduced and carried with the express object of limiting the patronage and influence of ministers, or, in other words, the ascendency of the crown over parliament. Not only did the act effect the abolition of a number of useless offices, but it also imposed restraints on the issue of secret service money, and made provision for a more effectual supervision of the royal expenditure. As to the pension list, the annual amount was to be limited to £95,000; no pension to any one person was to exceed £1,200, and all pensions were to be paid at the exchequer, thus putting a stop to the secret pensions payable during pleasure. Moreover, pensions were only to be bestowed in the way of royal bounty for persons in distress or as a reward for merit. Another very important change was made by this act: the civil list was divided into classes, and a fixed amount was to be appropriated to each class. The following were the classes:

1. Pensions and allowances of the royal family.
2. Payment of salaries of lord chancellor, speaker and judges.
3. Salaries of ministers to foreign courts resident at the same.
4. Approved bills of tradesmen, artificers and labourers for any article supplied and work done for His Majesty’s service.
5. Menial servants of the household.
6. Pension list.
7. Salaries of all other places payable out of the civil list revenues.
8. Salaries and pensions of treasurer or commissioners of the treasury and of the chancellor of the exchequer.

Yet debt was still the condition of the civil list down to the end of the reign, in spite of the reforms established by the Rockingham ministry, and notwithstanding the removal from the list of many charges unconnected with the king’s personal expenses. The debts discharged by parliament between 1782, the date of the passing of the Civil List Act, and the end of George III’s reign, amounted to £2,500,000. In all, during his reign £3,398,061 of debt owing by the civil list was paid off.

With the regency the civil list was increased by £70,000 per annum, and made in a special grant of £100,000, to be paid for the first time to the regent. In 1816 the annual amount was settled at £1,081,777, including the establishment of the king, now insane; though the civil list was relieved from some annuities payable to the royal family. Nevertheless, the fund still continued charged with such civil expenses as the salaries of judges, ambassadors and officers of state, and with pensions granted for public services. Other reforms were made as regards the definition of the several classes of expenditure, while the expenses of the royal household were henceforth to be audited by a treasury official—the auditor of the civil list. On the accession of George IV. the civil list, freed from the expenses of the late king, was settled at £845,727. On William IV. coming to the throne a sum of £1,150,000 per annum was fixed for the service of the civil list. The king at the same time surrendered all the sources of revenue enjoyed by his predecessors, apart from the civil list, represented by the hereditary revenues of Scotland—the Irish civil list, the duchy of Lancaster, the West India duties, and the various casual revenues hitherto vested in the crown, and independent of parliament. The revenues of the duchy of Lancaster were still retained by the crown. In return for this surrender and the diminished sum voted, the civil list was relieved from all the charges relating to the civil government than to the support of the dignity of the crown and the royal household. The future expenditure was divided into five classes, and a fixed annual sum was appropriated to each class. The pension list was reduced to £45,000. The king resisted an attempt on the part of the select committee to reduce the salaries of the officers of state on the grounds that this touched his prerogative, and the ministry of Earl Grey yielded to his remonstrance.

The civil list of Queen Victoria was settled on the same principles as that of William IV. A considerable reduction was made in the aggregate sum voted, the amount from £510,000 to £485,000, and the pension list was separated from the ordinary civil list. The civil list proper was divided into the following five classes, with a fixed sum appropriated to each:

CIVIL LIST
In addition the queen might, on the advice of her ministers, grant pensions up to £1,000 per annum, in accordance with a resolution of the House of Commons of February 18, 1834, "to such persons as have just claims on the royal beneficence or who, by their personal services to the crown, by the performance of duties to the public, or by their useful discoveries in science and attainments in literature and art, have merited the gracious consideration of the sovereign and the gratitude of their country." The service of these pensions increased the annual sum devoted to support the dignity of the crown and the expenses of the household to about £400,000. The list of pensions must be laid before parliament within thirty days of 20th June. Thus the civil list was reduced in amount, and relieved from the very charges which gave it its name as distinct from the statement of military and naval charges. It now really only dealt with the support of the dignity and honour of the crown and the royal household. The arrangement was most successful, and during the last three reigns there was no necessity for parliament to lay before them the list of debts incurred on the civil list.

The death of Queen Victoria rendered it necessary that a renewed provision should be made for the civil list; and King Edward VII., following former precedents, placed unreservedly at the disposal of parliament his hereditary revenues. A select committee of the House of Commons was appointed to consider the provisions of the civil list for the crown, and to report also on the question of grants for the honourable support and maintenance of Her Majesty the Queen and the members of the royal family. The committee in their conclusions were guided to a considerable extent by the actual civil list expenditure during the last ten years of the last reign, and made certain recommendations which, without undue interference with the sovereign's personal arrangements, tended towards increased efficiency and economy in the support of the sovereign's household and the honour and dignity of the crown. On their report was based the Civil List Act 1901, which established the new civil list. The system that the hereditary revenues should as before be paid into the exchequer and be part of the consolidated fund was maintained. The amount payable for the civil list was increased from £385,000 to £470,000. In the application of this sum the number of classes of expenditure to which separate amounts were to be appropriated was increased from five to six. The following was the new arrangement of classes: 1st class, Their Majesties' privy purse, £110,000; 2nd class, salaries of His Majesty's household and retired allowances, £125,800; 3rd class, expenses of His Majesty's household, £193,000; 4th class, works (the interior repair and decoration of Buckingham Palace and Windsor Castle), £200,000; 5th class, royal bounty, alms and special services, £13,200; 6th class, unappropriated, £80,000. The system relating to civil list pensions, established by the Civil List Act 1837, continued to apply, but the pensions were not regarded as chargeable on the sum paid for the civil list. The committee also advised that the mastership of the Buckhounds should not be continued; and the king, on the advice of his ministers, agreed to accept their recommendation. The maintenance of the royal hunt thus ceased to be a charge on the civil list. The annuities of £20,000 to the prince of Wales, of £10,000 to the princess of Wales, and of £18,000 to His Majesty's three daughters, were not included in the civil list, though they were conferred by the same act. Other grants made by special acts of parliament to members of the royal family were also excluded from it: these were £6000 to the princess Christian of Schleswig-Holstein, £6000 to the princess Louise (duchess of Argyll), £25,000 to the duke of Connaught, £6000 to the duchess of Albany, £6000 to the princess Beatrice (Henry of Battenberg), and £5000 to the duchess of Mecklenburg-Strelitz.

It may be interesting to compare with the British civil list the corresponding figures in other countries. These are as follows, the figures being those, for convenience, of 1905. Spain, £280,000, exclusive of allowances to members of the royal family; Portugal, £97,333, in addition to £133,155 to the queen-consort—total grant to the royal family, £216,700; Italy, £502,000, Torino allowance, was deducted for Duke Aosta, £16,000 to Prince Tommaso, duke of Genoa, and £40,000 to Queen Margherita; Belgium, £140,000; Netherlands, £50,000, with, in addition, £10,000 for the maintenance of the royal palaces in Germany, £77,000 (Kronodotationen Rente), the sovereign also possessing large private property (Kroendiinkommiss und Schatulguter), the revenue from which was laid in the annual budget and contributed to the expenditure of the court and the members of the royal family. France—Bourbon, £500,000; Bourbon, £500,000 to the heir-apparent; Norway, £38,888; Sweden, £72,700; Greece, £52,000, which included £4000 each from Great Britain, France and Russia; Austria-Hungary, £431,666, made up of £387,500, as emoluments for the Avustriacke Krones Rente, £38,888, and the crowns in the king of Hungary out of the revenues of Hungary; Japan, £30,000; Rumania, £47,000, in addition to revenues from certain crown lands; Servia, £48,000; Bulgaria, £40,000, besides £50,000 for maintenance of palaces, &c.; Montenegro, £8300; Russia had no civil list, the sovereign having all the revenue from the crown domains (actual amount unknown, but supposed to amount to over £4,000,000); the president of the French Republic had a salary of £40,000 a year, with a further £14,000 for expenses; and the president of the United States had a salary of £60,000 (from 1900, £75,000).

CIVIL SERVICE, the generic name given to the aggregate of all the public servants, or paid civil administrators and clerks, of a state. It is the machinery by which the executive, through the various administrations, carries on the central government of the country.

British Empire.—The appointments to the civil service until the year 1855 were made by nomination, with an examination not sufficient to form an intellectual or even a physical test. It was only after much consideration and almost years of discussion that the examination system was adopted. Various commissions reported on the civil service, and orders in council were issued. Finally in 1855 a qualifying examination of a stringent character was instituted, and in 1870 the principle of open competition was adopted as a general rule. On the report of the Playfair Commission (1876), an order in council was issued dividing the civil service into an upper and lower division. The order in council directed that a lower division should be constituted, and men and boys clerks holding permanent positions replaced the temporary assistants and writers. The "temporary" assistant was not found to be advantageous to the service. In December 1886 a new class of assistant clerks was formed to replace the men copyists. In 1887 the Ridley Commission reported on the civil service establishment. In 1890 two orders in council were issued based on the reports of the Ridley Commission, which sat from 1886 to 1890. The first order constituted what is now called the second division of the civil service. The second order in council concerned the officers of the 1st class, and provision was made for the possible promotion of the second division clerks to the first division after eight years' service.

The whole system is under the administration of the civil service commissioners, and power is given to them, with the approval of the treasury, to prescribe the subjects of examination, limits of age, &c. The age is fixed for compulsory retirement at sixty-five. In exceptional cases a prolongation of five years is within the powers of the civil service commissioners: The examination for 1st class clerkships is held concurrently with that of the civil service of India and Eastern cadetships in the colonial service. Candidates can compete for all three or for two. In addition to the intellectual test the candidates must fulfil the conditions as to age, &c. and the recommendation as to character, and pass a medical examination. This examination approximates closely to the university type of education. Indeed, there is little chance of success except for candidates who have had a successful university career, and frequently, in addition, special preparation by a private teacher. The subjects include the language and literature of England, France, Germany, Italy, ancient Greece and Rome, Sanskrit and Arabic, mathematics (pure and applied), natural science (chemistry, physics, zoology, &c.), history (English, Greek, Roman and general modern), political economy and
economic history, mental and moral philosophy, Roman and English law and political science. The candidate is obliged to reach a certain standard of knowledge in each subject before any marks at all are allowed him. This rule was made to prevent success by mere cramming, and to enable the candidate to have a better understanding of the basis of real study.

The maximum scale of the salaries of clerks of Class I is as follows:—3rd class, £200 a year, increasing by £120 a year to £500; 2nd class, £500, increasing by £200 a year to £1500; 1st class, £1500, increasing by £300 a year to £2500. Their pensions are fixed by the Superannuation Act 1859, 22 Vict. c. 26:—

"To any person who shall have served ten years and upwards, and under eleven years, an annual allowance of ten-sixtieths of the annual salary, and of the emoluments of each such salary until the completion of a period of service of forty years, when the annual allowance of forty-sixtieths may be granted; and no additional allowance shall be made in respect of any service beyond forty years."

"For eleven years and under twelve years, an annual allowance of eleven-sixtieths of such salary and emoluments:"

And in like manner a further addition to the annual allowance of one-twelfth of the annual salary, and of the emoluments of each such salary until the completion of a period of service of forty years, when the annual allowance of forty-sixtieths may be granted; and no additional allowance shall be made in respect of any service beyond forty years."

"For twelve years and under thirteen years, an annual allowance of twelve-sixtieths of such salary and emoluments:"

"For thirteen years and under fourteen years, an annual allowance of thirteen-sixtieths of such salary and emoluments:"

"For fourteen years and under twelve years, an annual allowance of eleven-sixtieths of such salary and emoluments:"

"For five years and under six years, an annual allowance of five-sixtieths of such salary and emoluments:"

"For six years and under seven years, an annual allowance of six-sixtieths of such salary and emoluments:"

"For seven years and under eight years, an annual allowance of seven-sixtieths of such salary and emoluments:"

"For eight years and under nine years, an annual allowance of eight-sixtieths of such salary and emoluments:"

"For nine years and under ten years, an annual allowance of nine-sixtieths of such salary and emoluments:"

"For ten years and under eleven years, an annual allowance of ten-sixtieths of such salary and emoluments:"

The "ordinary annual holidays allowed to officers" (1st class) "shall not exceed thirty-six week-days during each of their first ten years of service and forty-eight week-days thereafter." Order in Council, 13th August 1860.

The English scale. Within that maximum heads of departments have now, as they have hitherto had, an absolute discretion in fixing the annual leave.

Sick leave can be granted on full salary for not more than six months, on half-salary for another six months.

The scale of salary for 2nd division clerks begins at £50 a year, increasing by £5 to £100; then £100 a year, increasing by £10, to £100; and then £100 a year, increasing by £10 to £200. The highest is £300 to £500. Advancement in the 2nd division to the higher ranks depends on merit, not seniority. The ordinary annual holiday of the 2nd division clerks is 14 working days for the first two years. Thereafter they will be allowed sick leave for six months on full pay and six months on half-pay. The subjects of their examination are: (1) handwriting and orthography, including copyist MS.; (2) arithmetic; (3) English composition; (4) précis, including indexing and digest of returns; (5) book-keeping and shorthand writing; (6) geography and English history; (7) Latin; (8) French; (9) German; (10) elementary mathematics; (11) inorganic chemistry with elements of physics. Not more than four of the subjects (4) to (11) can be taken. The candidate must be between the ages of 17 and 20. A certain number of the places in the 2nd division were reserved for the candidates from the boy clerks appointed under the old system. The competition is severe, only about one out of every ten candidates being successful. Candidates are allowed a choice of departments subject to the exigencies of the services.

There is also a class of boy copyists who are almost entirely employed in London, a few in Dublin and Edinburgh, and, very seldom, in some provincial towns. The subjects of their examination are: Obligatory—handwriting and orthography, arithmetic and English composition. Optional—(any two of the following subjects are compulsory) copyist MS.; geography; (3) English history; (4) translation from one of the following languages—Latin, French or German; (5) Euclid, bk. I. and II., and algebra, up to and including simple equations. The first three of these subjects are the rudiments of chemistry and physics. Candidates must be between the ages of 15 and 18. They have no claims to superannuation or compensation allowance. Boy copyists are not retained after the age of 20.

Candidates for the civil service of India take the same examination as for 1st class clerkships. Candidates successful in the examination must subsequently spend one year in England. They receive for that year £130 if they elect to live at one of the universities or colleges approved by the secretary of state for India. They are submitted to a final examination in the following subjects—Indian Penal Code and the Code of Criminal Procedure, the principal vernacular language of the province to which they are assigned, the Indian Evidence Act (these three subjects are compulsory), either Hindu and Mahomedan Law, or Sanskrit, Arabic or Persian, Burmese (for Burma only). A candidate may not take Arabic or Sanskrit both in the first examination and in the final. They must also pass a thorough examination in riding.

On reaching India their salary begins at 400 rupees a month. They may take, as leave, one-fourth of the time on active service in periods strictly limited by regulation. After 25 years' service (of which 21 must be active service) they can retire on a pension of £100 a year. The unit of administration is the district.

At the head of the district is an executive officer called either collector-magistrate or deputy-commissioner. In most provinces he is responsible to the commissioner, who corresponds directly with the provincial government. The Indian civilian after four years' probation in both branches of the service is called upon to elect whether he will enter the revenue or judicial department, and this choice as a rule is held to be final for his future work.

Candidates for the Indian Forest Service have to pass a competitive examination, one of the compulsory subjects being German or French. They have also to pass a severe medical examination, especially in their powers of vision and hearing. They must be between the ages of 18 and 22. Successful candidates are required to pass a three years' course, with a final examination, seven terms of the course at an approved school of forestry, the rest of the time receiving practical instruction in continental European forests. On reaching India they start as assistant conservators at 380 rupees a month. The highest salary, that of inspector-general of forests, in the Indian Forest Service is 2650 rupees a month.

The Indian Civil Service. The examination of this service of very much the same kind as for the forest service, except that special subjects such as German and botany are not included. The candidates are limited in age to 19 and 21. They must pass a fitness examination, the fitness of the office being allotted as probationers, their wishes being consulted as far as possible as to their province. A probationer receives 300 rupees a month. A district superintendent can rise to 1200 rupees a month, while there is a maximum limit of 1700 rupees a month in the police service. The leave and pension in both these departments follow the general rules for Indian services.

The civil service also includes student interpreters for China, Japan and Siam, and for the Ottoman dominions, Persia, Greece and Morocco. Both these classes of student interpreters are selected by open competition. Their object is to supply the consular service in the above-named countries with persons having a thorough knowledge of the language of the country in which they serve.

In the first case, China, Japan, &c., they learn their language in the country itself, receiving £200 as probationers. Then they become assistants in a consulate. The highest post is that of consul-general. In the case of student interpreters for the Ottoman dominions, Persia, Greece and Morocco, the successful candidates learn their languages at Oxford. Turkish is taught gratuitously, but they pay usual fees for other languages. If Oxford they receive 200 a year for two years. On leaving Oxford they become assistants under the embassy at Constantinople, the legations at Tehran, Athens or Morocco, or at one of H.B.M. consulates. As assistants they receive 300 rupees a month. Consuls can rise to which they can reach, receive in the Levant from £500 to £1500 a year. The civil services of Ceylon, Hong-Kong, the Straits Settlements, and the Malay Peninsula are supplied by the Eastern cadetships. The limits of age for the examination are 18 and 24. The cadets are required to learn the native language of the colony or dependency to which they are assigned. In the case of the Straits Settlements and Malay cadets they may have to learn Chinese or Malay. The class of English fees or Oriental they may receive 3500 rupees per annum, gradually increasing until first-class officers receive from 12,000 to 18,000 rupees per annum. They are allowed three months' vacation on full pay in two years, and leave of absence by halves, or a year's vacation at any time, or before that if urgently needed. They can retire for ill-health after ten years with fifteen-sixtieths of their annual salary. Otherwise they can add one-sixtieth of their annual salary to their pension for every additional year's service up to thirty-five years' service.

In spite of the general rule of open competition, there are still a few departments where the system of nomination obtains, accompanied by a severe test of knowledge, either active or implied. Such are the foreign office, British Museum, and Board of education.

The employment of women in the civil service has been principally developed in the post office. Women are employed in the post office as female clerks, counter clerks, telegraphists, returners, sorters and post-mistresses all over the United Kingdom. The board of agriculture, the customs and the India office employ women. The department of agriculture, the board of education generally, the local government board, all to a certain
CIVIL SERVICE

extent employ women, whilst in the home office there are an increasing number of women inspectors of workshops and factories.

In 1881 the postmaster-general took a decided step in favour of female employment, and with the consent of the treasury instituted female clerkships. Female clerks do not come in contact with the public. Their duties are purely clerical, and entirely in the account-ant-general’s department at the savings bank. Their pay is not much more than minimum; their pension is on the ordinary civil service scale. The examination is competitive; the subjects are handwriting and spelling, arithmetic, English composition, geography, English history, French or German. Candidates must be between the ages of 16 and 18; they serve only in the Savings Bank department. If incompetent they then lose their position, and the salary of the female clerkships range from £200 to £500 in the higher grade, £55 to £190 in the 2nd class, whilst girls are paid from £35 to £40, with the chance of advancement to higher posts.

United States.—Civil service reform, like other great administrative reforms, began in America in the latter half of the 19th century. Personal and partisan government, with all the entailed evils of the patronage system, culminated in Great Britain during the reign of George III., and was one of the efficient causes of the American revolution. Trevelyan characterizes the use of patronage to influence legislation, and the giving of colonial positions as sycophants to the privileged classes and personal favourites, as the most flagrant evidence which, as its one achievement of the first order, brought about the American War, and made England sick, once and for all, of the very name of personal government.” It was natural that the founders of the new government in America, after breaking away from the mother-country, should strive to avoid the evils which had in a measure brought about the revolution. Their intention that the administrative officers of the government should hold office during good behaviour is manifest, and was given thorough and practical effect by every administration during the first forty years of the life of the government. The constitution fixed no term of office in the executive branch of the government except those of president and vice-president; and Madison, the expounder of the constitution, that the wanton removal of a meritorious officer was an impeachable offence. Not until nine years after the passage of the Four Years’ Tenure of Office Act in 1820 was there any material departure from this traditional policy of the government. This act (suggested by an appointing officer who wished to use the power it gave in order to secure his own nomination for the presidency, and passed without debate and apparently without any adequate conception of its full effect) opened the door to the spoils system, and the evils of the “spoils system,” the foremost statement of the time were not slow to perceive the baleful possibilities of this legislation. Jefferson, Webster, Clay, Calhoun, Benton and many others being recorded as condemning and deploring it in the strongest terms. The transition to the “spoils system” was not, however, immediate, and for the next nine years the practice of reappointing all meritorious officers was practically universal; but in 1820 this practice ceased, and the act of 1820 lent the sanction of law to the system of proscriptions which followed, which was a practical application of the theory that “to the victor belong the spoils of the enemy.” In 1836 the provisions of this law, which had at first been confined mainly to officers connected with the collection of revenue, were extended to include also all postmasters receiving a compensation of $4,000 per annum or more. It rapidly became the practice to regard all these four years’ tenure offices as agencies not so much for the transaction of the public business as for the advancement of political ends. The revenue service from being used for political purposes merely came to be used for corrupt purposes as well, with the result that in one administration frauds were practised upon the government to the extent of $75,000,000. The corrupting influences pervaded the whole body politic. Political retainers were selected for appointment not on account of their ability to do certain work but because they were followers of certain politicians; these “public servants” acknowledged no obligation except to those politicians, and their public duties, if not entirely disregarded, were negligently and inefficiently performed. Thus grew a saturnalia of spoils and corruption which culminated in the assassination of a president.

Acute conditions, not theories, give rise to reforms. In the congressional election of November 1882, following the assassination of President Garfield as an incident in the operation of the spoils system, the voice of the people commanding reform was unmistakable. Congress assembled in December 1882, and during the same month a bill looking to the improvement of the civil service, which had been pending in the Senate for nearly two years, was finally taken up and considered by that body. In the debate upon this bill its advocates declared that it would “vastly improve the whole civil service of the country,” which they characterized as being at that time “inefficient, expensive and extravagant, and in many instances corrupt.”

This bill passed the Senate on the 27th of December 1882, and the House on the 4th of January 1883, and was signed by the president on the 16th of January 1883, coming into full operation on the 16th of July 1883. It is not necessary to discuss the law, its fundamental principles of this law are:— (1) selection by competitive examination for all appointments to the “classified service,” with a period of probationary service before absolute appointment; (2) apportionment among the states and territories, according to population, of all appointments in the departmental service at Washington; (3) freedom of all the employees of the government from any necessity to contribute to political campaign funds or to render political services. For putting these principles into effect the Civil Service Commission was created, and penalties were imposed for the solicitation or collection from government employees of contributions for political purposes, and for the use of official positions in coercing political action. The commission, in addition to its regular duties of aiding in the preparation of civil service rules, of regulating and holding examinations, and certifying the results thereof for use in making appointments, and of keeping records of all changes in the service, was given authority to investigate and report upon any violations of the act or rules. The “classified” service to which the act applies has grown, by the action of successive presidents in progressively including various branches of the service within it, from 13,924 in 1883, to 18,256 in 1885 (in round numbers) in 1900, constituting about 40% of the entire civil service of the government and including practically all positions above the grade of mere labourer or workman to which appointment is made directly by the president with the consent of the Senate. A very large class to which the act is expressly applicable, and which has been partly brought within its provisions by executive action, is that of fourth-class postmasters, of whom there are between 70,000 and 80,000 (about 15,000 classified in 1900).

In order to provide registers of eligibles for the various grades of positions in the classified service, the United States Civil Service Commission holds annually throughout the country about 300 different kinds of examinations. In the work of preparing these examinations and of marking the papers of competitors in them the commission is authorized by law to avail itself, in addition to its own corps of trained men, of the services of the scientific and other experts in the various executive departments. In the work of holding the examinations it is aided by about 1,500 local boards of examiners, which are its local representatives throughout the country and are selected by the commission from lists of eligible candidates compiled by the executive departments.

The progressive classification of the executive civil service, showing the growth of the merit system, is discussed, with statistics, in the U.S. Civil Service Commission’s Sixteenth Report, pp. 129-137.

A revision of this discussion, with important additions, appears in the Seventeenth Report.
located at the principal post offices, custom houses and other government offices, being comprised of three or more Federal employees in those offices. About 50,000 persons annually compete in these examinations, and about 10,000 of those who are successful receive appointments through regular certification. Persons thus appointed, however, must serve six months "on probation" before their appointment can be made absolute. At the end of this probation, if his service has not been satisfactory, the appointee is simply dropped; and the fact that less than 1% of those appointed prove thus deficient on trial is high testimony to the practical nature of the examinations held by the commission, and to their aptness for securing persons qualified for all classes of positions.

The effects of the Civil Service Act within the scope of its actual operation have amply justified the hopes and promises of its advocates. After its passage, absentee holders of lucrative appointments were required to report for duty or to sever their connexion with the service. Improved methods were adopted in the departments, and superfluous and useless work was no longer devised in order to provide a show of employment and a locus standi for the parasites upon the public service. Individual clerks were required, and by reason of the new conditions were enabled, to do more and better work; and this, coupled with the increase in efficiency in the service on account of new blood coming in through the examinations, made possible an actual decrease in the force required in many offices, notwithstanding the natural growth in the amount of work to be done. Experience proves that the desire to create new and unnecessary positions was in direct proportion to the power to control them, for where the act has taken away this power of control the desire had disappeared naturally. There is no longer any desire on the part of heads of departments to increase the number or salaries of classified positions which would fall by law within the civil service rules and be subject to competitive examinations. Thus the promises of improvement and economy in the service have been fulfilled.

The chief drawback to the full success of the act within its intended scope of operation has been the withholding of certain positions in the service from the application of the vital principle of competition. The Civil Service Act contemplated no exceptions, within the limits to which it was made applicable, to the general principle of competition upon merit for entrance to the service. In framing the first civil service rules, however, in 1883, the president, yielding to the pressure of the heads of some of the departments, and against the urgent protest of the Civil Service Commission, excepted from the requirement of examination large numbers of positions in the higher grades of the service, chiefly fiduciary and administrative positions such as cashiers, chief clerks and chiefs of division. These positions being thus continued under the absolute control of the appointing officer, the effect of their exception from examination was to retain just that much of the old or "spoils" system within the nominal jurisdiction of the new or "merit" system. Even more: under the old system, while appointments from the outside had been made regardless of fitness, still those appointments made in the lower grades, the higher positions being filled by promotion within the service, usually of the most competent, but under the new system with its exceptions, while appointments to the lower grades were filled on the basis of merit, the pressure for spoils at each change of administration forced inexperienced, political or personal favourites in at the top. This blocked promotions and demoralized the service. Thus, while the general effect of the act was to limit very greatly the number of vicious appointments, at the same time the effect of these exceptions was to confine them to the upper grades, where the demoralizing effect of each upon the service would be a maximum. By constant efforts the Civil Service Commission succeeded in having position after position withdrawn from this excepted class, until by the action of the president, on the 6th of May 1896, it was finally reduced almost to a minimum. Subsequent

presidential action, however, on the 29th of May 1899, the excepted class was again greatly extended.8 A further obstacle to the complete success of the merit system, and one which prevents the carrying forward of the reform to the extent to which it has been carried in Great Britain, is inherent in the Civil Service Act itself. All postmasters who receive compensation of $1000 or more per annum, and all collectors of customs and collectors of internal revenue, are appointed by the president and confirmed by the Senate, and are therefore, by express provision of the act, not "required to be classified." The universal practice of treating these offices as political agencies instead of as administrative business offices is therefore not limited by the act. Such officers are active in political work throughout the country, and their official position adds greatly to their power to affect the political prospects of the leaders in their districts. Accordingly the Senate, from being, as originally intended, merely a confirming body as to these officers, has become in a large measure, actually if not formally, a nominating body, and holds with tenacity to the power thus acquired by the individual senators. Thorough civil service reform requires that these positions also, and all those of fourth-class postmasters (partly classified by order of 1st Dec. 1908), be made subject to the merit system, for in them is the real remaining stronghold of the spoils system. Even though all their subordinates be appointed through examination, it will be impossible to carry the reform to ultimate and complete success so long as the officers in charge are appointed mainly for political reasons and are changed with every change of administration.

The purpose of the act to protect the individual employees in the service from the rapacity of the "political barons" has been measurably, if not completely, successful. The power given the Civil Service Commission, to investigate and report upon violations of the law, has been used to bring to light such abuses as the levying of political contributions, and to set the machinery of the law in motion against them. While comparatively few actual prosecutions have been brought about, and although the penalties imposed by the act for this offence have been but seldom inflicted, still the publicity given to all such cases by the commission's investigations has had a wholesome deterrent effect. Before the passage of the act, positions were as a general rule held upon a well-understood lease-tenure, the political contributions for them being as secure and as certainly collected as any rent. Now, however, it can be said that these forced contributions have almost entirely disappeared. The efforts which are still made to collect political funds from government employees in evasion of the law are limited in the main to persuasion to make "voluntary" contributions, and it has been possible so to limit and obstruct these efforts that their practical effect upon the character of the service is now very small.

The same evils that the Federal Civil Service Act was designed to remedy exist to a large degree in many of the state governments, and are especially aggravated in the administration of the local governments of some of the larger cities. The chief, if not the only, test of fitness for office in many cases has been partisanship, honesty in capacity being seldom more than secondary considerations. The result has been the fostering of dishonesty and extravagance, which have brought weakness and gross corruption into the administration of the local governments. In consequence of this there has been a constantly growing tendency, among the more intelligent class of citizens, to demand that honest business methods be applied to local public service, and that appointments be made on the basis of intelligence and capacity, rather than of party allegiance. The movement for the reform of the civil service of cities is going hand in hand with the movement for general municipal reform, those reformers regarding the merit

8 For the scope of these exceptions, see Civil Service Commission's Fourteenth Report, pp. 1-14.
system of appointments as not merely the necessary and only safe bulwark to preserve the results of their labours, but also as the most efficient means for bringing about other reforms. Hence civil service reform is given a leading position in all programmes for the reform of state and municipal governments. This has undoubtedly been due, in the first instance, at least, to the success which attended the application of the merit system to the Federal service, municipal and state legislation following in the wake of the national civil service law. In New York an act similar to the Federal Civil Service Act was passed on the 4th of May 1883, and in 1894 the principles of the merit system were introduced by an amendment into the state constitution, and made applicable to cities and villages as well. In Massachusetts an act was passed on the 3rd of June 1884 which in its general features was based upon the Federal act and the New York act. Similar laws were passed in Illinois and Wisconsin in 1895, and in New Jersey in 1908; the laws provide for the adoption of the merit system in state and municipal government. In New Orleans, La., and Seattle, Wash., the merit system was introduced by an amendment to the city charter in 1896. The same result was accomplished by New Haven, Conn., in 1897, and by San Francisco, Cal., in 1899. In still other cities the principles of the merit system have been enacted into law, in some cases applying to the entire service and in others to only a part of it.

The application of the merit system to state and municipal governments has proved successful wherever it has been given a fair trial. As experience has fostered public confidence in the system, and at the same time shown those features of the law which are most vulnerable, and the best means for fortifying them, numerous and important improvements upon the pioneer act applying to the Federal service have been introduced in the more recent legislation. This is particularly true of the acts now in force in New York (passed in 1895) and in Chicago. The power of the commission to enforce these acts is materially greater than that possessed by the Federal commission. In making investigations they are not confined to taking the testimony of voluntary witnesses, but may administer oaths, and compel testimony and the production of books and papers where necessary; and in taking action they are not confined to the making of a report of the findings in their investigations, but may themselves, in many cases, take final judicial action. Further than this, the payment of salaries is made dependent upon the certificate of the commission that the appointments of the recipients were made in accordance with the civil service law and rules. Thus these commissions have absolute power to prevent irregular or illegal appointments by refractory appointing officers. Their powers being so much greater than those of the national commission, their action can be much more drastic in most cases, and they can go more directly to the heart of an existing abuse, and apply more quickly and effectually the needed remedy.

Upon the termination of the Spanish-American War, the necessity for the extension of the principles of the merit system to the new territories, the responsibility for whose government the results of this war had thrown upon the United States, was realized. By the acts providing for civil government in Porto Rico (April 12th, 1900) and Hawaii (April 30th, 1900), the provisions of the Civil Service Act and Rules were applied to those islands. Under this legislation the classification applies to all positions which are analogous to positions in the Federal service, those which correspond to positions in the municipal and state governments being considered as local in character, and not included in the classification.

On the 19th of September 1900 the United States Philippine Commission passed an act "for the establishment and maintenance of an efficient and honest civil service in the Philippine Islands." This act, in its general features, is based upon the national civil service law, but includes also a number of the stronger points to be found in the state and municipal law mentioned above. Among these are the power given the civil service board to administer oaths, summon witnesses, and require the production of official records; and the power to stop payment of salaries to persons illegally appointed. Promotions are determined by competitive examinations, and are made throughout the service, as there are no excepted positions. A just right of preference in local appointments is given to natives. The president of the Philippine commission in introducing this bill said: "The purpose of the United States government... in these islands is to secure for the Filipino people as honest and as efficient a government as may be possible... It is the purpose of the commission to make it possible for one entering the lowest ranks to reach the highest, under a tenure based solely upon merit." Judging by past experience it is believed that this law is well adapted to accomplish the purpose above stated.

For fuller information upon the details of the present workings of the merit system in the Federal service, recourse should be had to the publications of the U.S. Civil Service Commission, which are to be found in the public libraries in all the principal cities in the United States, or which may be had free of charge upon application to the U.S. Civil Service Commission, 311-517, Federal Building, Washington, D.C. The Commission's annual report, published semi-annually, gives full information as to the character of the examinations held by the commission, together with the schedule of dates and places for the holding of those examinations. The Annual Report contains also the full report of the examination conducted for the "practice of the presidents in appointments and removals in the executive civil service, from 1789 to 1883." In the same report, pp. 511-517, is a somewhat comprehensive bibliography of "civil service reform in the United States, from the period of the treaty with France, in 1815, to the end of 1898. See also C. R. Fish, The Civil Service and the Patronage (New York, 1905).

In most European countries the civil service is recruited on much the same principles as in the United Kingdom and the United States, that is, either by examination or by nomination or by both. In some cases the examination is purely competitive, in other cases, as in France, holders of university degrees get special privileges, such as exemption from examination. There are also a number of places, or, as in Germany, many departmental posts are filled by nomination, combined with the results of general examinations, either at school or university. In the publications of the United States Department of Labour and Commissary for 1904-1905 will be found brief details of the systems adopted by the various foreign countries for appointing their civil service employees.

CIVITA CASTELLANA (anc. Falerii, q.v.), a town and episcopal see of the province of Rome, 45 m. by rail from the city of Rome (the station is 5 m. N.E. of the town). Population (1901) 5,625. The cathedral of S. Maria possesses a fine portico, erected in 1210 by Laurentius Romanus, his son Jacobus and his grandson Cosmas, in the cosmatesque style, with ancient columns and mosaic decorations: the interior was modernized in the 18th century, but has some fragments of cosmatesque ornamentation. The citadel was erected by Pope Alexander VI. from the designs of Antonio da Sangallo the elder, and enlarged by Julius II. and Leo X. The lofty bridge by which the town is approached belongs to the 18th century. Mount Soracte lies about 6 m. to the south-east.

CIVITA VECCHIA, a seaport town and episcopal see of Italy, in the province of Rome, 50 m. N.W. by rail and 35 m. direct from the city of Rome. Pop. (1871) 8,143; (1901) 17,589. It is the ancient Centum Cellae, founded by Trajan. Interesting descriptions of it are given by Fliny the Younger (Epist. vi. 31) and Rutilius Namat. i. 237. The modern harbour works rest on the ancient foundations, and near it the cemetery of the remains of the Classis Misensensis and Ravennas has been found (Corp. Inscr. Lat. vol. xi., Berlin, 1888, pp. 3,520 seq.). Remains of an aqueduct and other Roman buildings are preserved; the imperial family had a villa here. Propocius mentions it in the 6th century as a strong and populous place, but it was destroyed in 813 by the Saracens. Leo IV. erected a new city for the inhabitants on the site where they had taken refuge, about 180 miles N.N.E. of Civita Vecchia towards the hills, near La Farnesina, where its ruins may still be seen; the city walls and some of the streets and buildings may be traced, and an inscriptions
CLACKMANNAN—CLACKMANNANSHIRE

(geological) The county has been divided into two areas, the boundary line skirting the southern margin of the Ochils and running westwards from a point north of Dollar by Alva in the direction of Alloa. The northern portion forms part of the volcanic range of the Ochils which belongs to the Old Red Sandstone period, and consists of a great succession of lavas—basalts and andesites—with intercalations of tuff and agglomerate. As the rocks dip gently towards the north and form the highest ground in the country they must reach a granodiorite rock, and this has given rise to the well-marked feature running E. and W. along the great base of the Ochils indicating a line of fault or dislocation which is supposed to have been produced in the Carboniferous period by the western continuation of the great Linlithgow basin which extends northwards by Clackmannan, Falkirk and the Carron Ironworks to Alloa. Along the eastern margin between Callanish and Bruce- man and towards the Forth is the Carboniferous limestone, and to the north of the country is the Carboniferous limestone, and to the north of the country is the Carboniferous limestone. The structure of Clackmannan is interesting. The strata are arranged in synclinal form, the highest seams being found near the Devon ironworks, and they are traversed by a series of parallel east and west faults each with a downthrow to the south, whereby the strata are repeated and the field extended. During mining operations every seam has been obtained of the existence of a buried river-channel, filled with brown clay and stratified deposits along the course of the Devon, which extends below the present sea-level and points to greater elevation of the land in early times.

Industries.—The soil is generally productive and well cultivated, though the greater part of the elevated range which is intersected by the glen lands on the Forth and the Vale of Devors at the base of the Ochils on the north consists of inferior soils, often lying upon an impervious clay. Oats are the chief crop, but wheat and barley are profitably grown. Sheep-farming is successfully pursued, the Ochil's offering the most picturesque pasture, and cattle, pigs and horses are also raised. There is a small tract of moorland in the east, called the Forest, bounded on its northern margin by the Black Devon. Iron-ore (haematite), copper, silver, lead, coal and arsenic have all been discovered in small quantity in the Ochils, between Alva and Dollar. The iron-ore is found either in beds, or in oblate balls embedded in silt clay, and yielded from 25 to 50% of iron—mined for the Devon iron-works, near Clackmannan. Coal has been mined for a long period. The strata which compose the field are varieties of sandstone, shale, fire-clay and argillaceous ironstone. There is a heavy continuous output of coal at the mines at Sauchie, Fishcross, Coalsnaughton, Devonside, Clackmannan and other pits. The spinning-mills at Alloa, Tillicoultry and Alva are always busy, Alva yarns and fingering being widely famous. The distilleries at Glenochil and Carlsruhe and the breweries in Alloa and Cambus do a large export business. The minor trades include glass-blowing, pottery, coopering, tanning, iron-founding, electrical apparatus making, shipbuilding and paper-making.

The north British railway serves the whole county, while the Caledonian has access to Alloa.

Population and Government.—The population was 33,140 in 1851 and 35,269 in 1891, when 170 persons spoke Gaelic and 100 were in the Roman Catholic communion. The county consists of one barony, Clackmannan, which in 1815 was given by Kinross-shire in returning one member to parliament. Clackmannan has access to Alloa.

Geology.—This county is divided geologically into two areas, the boundary line skirting the southern margin of the Ochils and running westwards from a point north of Dollar by Alva in the direction of Alloa. The northern portion forms part of the volcanic range of the Ochils which belongs to the Old Red Sandstone period, and consists of a great succession of lavas—basalts and andesites—with intercalations of tuff and agglomerate. As the rocks dip gently towards the north and form the highest ground in the country they must reach a granodiorite rock, and this has given rise to the well-marked feature running E. and W. along the great base of the Ochils indicating a line of fault or dislocation which is supposed to have been produced in the Carboniferous period by the western continuation of the great Linlithgow basin which extends northwards by Clackmannan, Falkirk and the Carron Ironworks to Alloa. Along the eastern margin between Callanish and Bruce-man and towards the Forth is the Carboniferous limestone, and to the north of the country is the Carboniferous limestone. The structure of Clackmannan is interesting. The strata are arranged in synclinal form, the highest seams being found near the Devon ironworks, and they are traversed by a series of parallel east and west faults each with a downthrow to the south, whereby the strata are repeated and the field extended. During mining operations every seam has been obtained of the existence of a buried river-channel, filled with brown clay and stratified deposits along the course of the Devon, which extends below the present sea-level and points to greater elevation of the land in early times.

Industries.—The soil is generally productive and well cultivated, though the greater part of the elevated range which is intersected by the glen lands on the Forth and the Vale of Devors at the base of the Ochils on the north consists of inferior soils, often lying upon an impervious clay. Oats are the chief crop, but wheat and barley are profitably grown. The minor trades include glass-blowing, pottery, coopering, tanning, iron-founding, electrical apparatus making, shipbuilding and paper-making.

The north British railway serves the whole county, while the Caledonian has access to Alloa.

Population and Government.—The population was 33,140 in 1851 and 35,269 in 1891, when 170 persons spoke Gaelic and 100 were in the Roman Catholic communion. The county consists of one barony, Clackmannan, which in 1815 was given by Kinross-shire in returning one member to parliament. Clackmannan has access to Alloa.
CLACTON-ON-SEA, a watering-place in the Harwich parliamentary division of Essex, England; 71 m. N.E. of London by rail, and 7 m. from Colchester on the Great Eastern railway; served also by steamer from London in the summer months. Pop. of urban district (1901) 74,356. Clay cliffs of slight altitude rise from the sandy beach and face south-eastward. In the neighbourhood, however, marshes fringe the shore. The church of Great Clacton, at the village 1½ m. inland, is Norman and later, and of considerable interest. Clacton is provided with a pier, promenade and marine parade; and is the seat of various convalescent and other homes.

CLADEL, LÉON (1835-1892), French novelist, was born at Montauban (Tarn-et-Garonne) on the 13th of March 1835. The son of an artisan, he studied law at Toulouse and became a solicitor’s clerk in Paris. He made a reputation in a limited circle by his first book, Les Martyrs ridicules (1862), a novel for which Charles Baudelaire, whose literary disciple Cladel was, wrote a preface. He then returned to his native district of Quercy, where he produced a series of pictures of peasant life in Eral le banieur (1865), Le Nommé Oualé (1868) and other volumes. Returning to Paris he published the two novels which are generally acknowledged as his best work, Le Bovasté (1869) and La Fête votive de Saint Bartholomée Port-glaive (1872). Une Maudite (1876) was judged dangerous to the public morals and cost its author a month’s imprisonment. Other works by Cladel are Les Va-nu-poids (1873), a volume of short stories; N’a qu’un aïl (1882), Urbains et ruraux (1884), Gueux de marque (1887), and the posthumous Juive errante (1897). He died at Sèvres on the 20th of July 1892.

See La Vie de Léon Cladel (Paris, 1905), by his daughter Judith Cladel, containing also an article on Cladel by Edmond Picard, a complete list of his works, and of the critical articles on his work.

CLAPLIN, HORACE BRIGHAM (1811-1885), American merchant, was born in Milford, Massachusetts, on the 18th of December 1811. He was educated at Milford Academy, became a clerk in his father’s store in Milford, and in 1837, with his brother Aaron and his brother-in-law Samuel Daniels, succeeded to his father’s business. In 1832 the firm opened a branch store in Worcester, Mass., and in 1833 Horace B. Claplin and Daniels secured the sole control of this establishment and restricted their dealing to dry goods. In 1843 Claplin removed to New York City and became a member of the firm of Bulkley & Claplin, wholesale dry goods merchants. In 1851 and in 1864 the firm was reorganized, being designated in these respective years as Claplin, Mellin & Company and H. B. Claplin & Company. Under Claplin’s management the business increased so rapidly that the sales for a time after 1865 probably exceeded those of any other mercantile house in the world. Though the firm was temporarily embarrassed at the beginning of the Civil war, on account of its large business interests in the South, and during the financial panic of 1873, the promptness with which Mr. Claplin met these crises and paid every dollar of his liabilities greatly increased his reputation for business ability and integrity. He died at New York on the 8th of November, 1885.

CLAIRVAUX (or CLAIRVAUX), ALEXIS CLAUDE (1717-1765). French mathematician, was born on the 13th or 7th of May 1715, at Paris, where his father was a teacher of mathematics. Under his father’s tuition he made such rapid progress in mathematical studies that in his thirteenth year he read before the French Academy an account of the properties of four curves which he had then discovered. When only sixteen he finished a treatise, Recherches sur les courbes à double courbure, which, on its publication in 1731, procured his admission into the Academy of Sciences, although even then he was below the legal age. In 1736, together with Pierre Louis Maupertuis, he took part in the expedition to Lapland, which was undertaken for the purpose of estimating a degree of the meridian, and on his return published his treatise Théorie de la figure de la terre (1743). In this work he promulgated the theorem, known as "Clairault’s theorem," which connects the gravity at points on the surface of a rotating ellipsoid with the compression and the centrifugal force at the equator (see Earth, Figure of the). He obtained an ingenious approximate solution of the problem of the three bodies; in 1750 he gained the prize of the St. Petersburg Academy for his essay Théorie de la lune; and in 1759 he calculated the perihelion of Halley’s comet. He also detected singular solutions in differential equations of the first order, and of the second and higher degrees. Clairaut died at Paris, on the 17th of May 1765.

CLAIRON, LA (1723-1803), French actress, whose real name was CLAIRE JOSEPH HIPPOLYTE LERIS, was born at Condé sur l’Escuat, Hainaut, on the 25th of January 1723, the natural daughter of any army serjeant. In 1736 she made her first stage appearance at the Comédie Italienne, in a small part in Marivaux’s L’Ides des esclaves. After several years in the provinces she returned to Paris. Her life, meanwhile, had been decided irregular, even if not to the degree indicated by the libellous pamphlet Histoire de la demoiselle Crolot, dite Frétillon, actrice de la Comédie de Rouen, &c. (The Hague, 1746), or to be inferred from the disingenuousness of her own Mémoires d’Hippolyte Clairon (1798); and she had great difficulty in obtaining an order to make her débuts at the Comédie Française. Succeeding, however, at last, she had the courage to select the title rôle of Phèdre (1748), and she obtained a veritable triumph. During her twenty-two years at this theatre, dividing the honours with her rival Mlle Dumesnil, she filled many of the classical rôles of tragedy, and created a great number of parts in the plays of Voltaire, Marivaux, Sureau, de Belloy and others. She retired in 1766, and trained pupils for the stage, among them Mlle Raucourt. Goldsmith called Mlle Clairon "the most perfect female figure I have ever seen on any stage" (The Bee, 2nd No.), and Garrick, while recognizing her unwillingness or inability to make use of the inspiration of the instant, admitted that "she has everything that art and a good understanding with great natural spirit can give her."

CLAIRVAUX, a village of north-eastern France, in the department of Aube, 40 m. E.S.E. of Troyes on the Eastern railway to Bellfort. Clairvaux (Clara Vallis) is situated in the valley of the Aube on the eastern border of the Forest of Clairvaux. Its celebrity is due to the abbey founded in 1115 by St. Bernard, which became the centre of the Cistercian order. The buildings (see ABBEY) belong for the most part to the 18th century, but there is a large storehouse which dates from the 12th century. The abbey, suppressed at the Revolution, now serves as a prison, containing on an average 800 inmates, who are employed in agricultural and industrial occupations. Clairvaux has iron-works of some importance.

CLAIRVOYANCE (Fr. for "clear-seeing"), a technical term in psychical research, properly equivalent to lucidity, a super-normal power of obtaining knowledge in which no part is played by (a) the ordinary processes of sense-perception or (b) super-normal communication with other intelligences, incarnate, or discarnate. The word is also used, sometimes qualified by the word telepathic, to mean the power of gaining super-normal knowledge from the mind of another (see TELEPATHY). It is further commonly used by spiritualists to mean the power of discerning spirit forms, or, more vaguely, of discovering facts by some super-normal means.

Lucidity.—Few experiments have been made to test the existence of this faculty. If communications from discarnate minds are regarded as possible, there are no means of distinguishing facts obtained in this way from facts obtained by independent clairvoyance. In practice no evidence has been obtained pointing to the possession by a discarnate spirit of knowledge not possessed by any living person (see MEDIUM). As explanation of the few successful experiments in independent clairvoyance we have the choice of three explanations: (1) lucidity; (2) telepathy from living persons; (3) hyperesthesia. The second possibility was overlooked in Richet’s diagram experiments; it cannot be assumed that a picture put into an envelope and not consciously recalled has been in reality forgotten. Similarly the clairvoyant diagnosis of diseases may depend on knowledge gained telepathically from the patient, who may be subliminally aware of disclosed states of the body. The most elaborate experiments are by Prof. Richet with a hypnotized subject who succeeded in
naming twelve cards out of sixty-eight. But no precautions were taken against hyperaesthesia further than enclosing the card in a second envelope. There is a power possessed by a certain number of people, of naming a card drawn by them or held in the hand face downwards, so that there is no normal knowledge of its suit and number. Few thorough trials have been made; but it seems to point to some kind of hyperaesthesia rather than to clairvoyance; in the Richet experiments even if the envelopes excluded hyperaesthesia of touch on the part of the medium, there may have been subliminal knowledge on Prof. Richet's part of the card which he put in the envelope. The experience known as the déjà vu has sometimes been explained as due to clairvoyance.

**Telepathic Clairvoyance.**—For a discussion of this see Telepathy and Crystal-gazing. It may be noted here that some curious relation seems to exist between apparently telepathic acquisition of knowledge and the arrival of a letter, newspaper, &c., from which the same knowledge could be directly gained. We are confronted with a similar problem in attempting an explanation of the power of mediums to state correctly facts relating to objects placed in their hands. Of a somewhat different character is retrocognition (q.v.), where the knowledge in many cases, if telepathic, must be derived from a discarnate mind.

Clairvoyance, as a term of spiritualism, with its correlative clairaudience, is the name given to the power of seeing and hearing discarnate spirits of dead relatives and others, with whom the living are said to be surrounded. More vaguely it includes the power of gaining knowledge, either through the spiritual world or by means of psychometry (i.e. the supernormal acquisition of knowledge about owners of objects, writers of letters, &c.).

Some evidence for these latter powers has been accumulated by the Society for Psychical Research, but in many cases the piecing together of normally acquired knowledge, together with shrewd guessing, suffices to explain the facts, especially where the investigator has had no special training for his task.

**CLAMECY,—CLAN**

**CLAMECY,** a town of central France, capital of an arrondissement in the department of Nièvre, at the confluence of the Yonne and Beuvron and on the Canal du Nivernais, 46 m. N.N.E. of Nevers on the Paris-Lyon railway. Pop. (1906) 4455. Its principal building is the church of St Martin, which dates chiefly from the 13th, 14th and 15th centuries. The town and façade are of the 16th century. The chateau, which is surrounded by an aisle, is rectangular—a feature found in few French churches. Of the old château of the counts of Nevers, vaulted cellars alone remain. A church in the suburb of Bethlem, dating from the 14th and 15th centuries, now serves as part of an hotel. The public institutions include the sub-prefecture, tribunals of first instance and of commerce and a communal college. Among the industrial establishments are saw-mills, fulling-mills and flour-mills, tanneries and manufactories of boots and shoes and chemicals; and there is considerable trade in wine and cattle and in wood and charcoal, which is conveyed principally to Paris, by way of the Yonne.

In the early middle ages Clamecy belonged to the abbey of St Julian at Auxerre; in the 11th century it passed to the counts of Nevers, one of whom, Hervé, enfranchised the inhabitants in 1213. After the capture of Jerusalem by Saladin in 1188, Clamecy became the seat of the bishops of Bethlem, who till the Revolution resided in the hospital of Panthéon, bequeathed by William IV, count of Nevers. On the coup d'état of 1851 an insurrection broke out in the town, and was repressed by the new authorities with great severity.

**CLAN** (Gaelic clann, O. Ir. clánd, connected with Lat. planta, shoot or scion, the ancient Gaelic or Goidelic substituting k for p), a group of people united by common blood, and usually settled in a common habitat. The clan system existed in Ireland and the Highlands of Scotland from early times. In its strictest sense the system was peculiar to those countries, but, in its wider meaning of a group of kindred forming a self-governing community, the system as represented by the village community has been shown by Sir H. Maine and others to have existed at one time or another in all lands.

Before the use of surnames and elaborate written genealogies, a tribe in its definite sense was called in Celtic a tuath, a word of wide affinities, from a root tu, to grow, to multiply, existing in all European languages. When the tribal system began to be broken up by conquest and by the rise of towns and of territorial government, the use of a common surname furnished a new bond for keeping up a connexion between kindred. The head of a tribe or smaller group of kindred selected some ancestor and called himself his Us, grandson, or as it has been anglicized O', e.g. Ua Conchobair (O'Conor), Ua Silleabhain (O'Sullivan). All his kindred adopted the same name, the chief using no forename. No matter how, a distinguishing person before the introduction of surnames was to name his father and grandfather, e.g. Owen, son of Donal, son of Dermot. This naturally led some to form their surnames with Mac, son, instead of Ua, grandson, e.g. Mac Carthaigh, son of Conlac'h (MacCarthy, Mac Ruaidhri, son of Rory (Macrory). Both methods have been followed in Ireland, but in Scotland Mac came to be exclusively used. The adoption of such genealogical surnames fostered the notion that all who bore the same surname were kinsmen, and hence the genealogical term clann, which properly means the descendants of some progenitor, gradually became synonymous with tuath, tribe. Like all purely genealogical terms, clann may be used in the limited sense of a particular tribe governed by a chief, or in that of many tribes claiming descent from a common ancestor. In the latter sense it was synonymous with il, siol, seed e.g. Siol Alpine, a great clan which included the smaller clans of the Macgregors, Grants, MacKinnons, Macnabs, Macphies, Macquaries and Macaulays.

The clan system in the most archaic form of which we have any definite information can be best studied in the Irish tuath, or tribe.1 This consisted of two classes: (1) tribesmen, and (2) a miscellaneous class of slaves, criminals, strangers and their descendants. The first class included tribesmen by blood in the male line, including all illegitimate children acknowledged by their fathers, and tribesmen by adoption or sons of tribeswomen by strangers, foster-sons, men who had done some signal service to the tribe, and lastly the descendants of the second class after a certain number of generations. Each *tuath* had a chief called a *rig*, king, a word cognate with the Gaulish rig- or ris, the Latin reg-s or rex, and the Old Norse rik-ir. The tribesmen formed a number of communities, each of which, like the tribe itself, consisted of a head, *comh fhein*, his kinsmen, slaves and other retainers. This was the *feine*, or sep. Each of these occupied a certain part of the tribe-land, the arable part being cultivated under a system of co-tillage, the pasture land co-grazed according to certain customs, and the wood, bog and mountains forming the marshland of the sep being the unrestricted common land of the sep. The *sept* was in fact a village community.

What the sep was to the tribe, the homestead was to the sep. The head of a homestead was an *aire*, a representative freeman capable of acting as a witness, compurgator and bail. These were very important functions, especially when it is borne in mind that the tribal system was the home of many of the kinsfolk of the head of the family as well as of his own children. The descent of property being according to a gavel-kind custom, it constantly happened that a man was to be the heir of his kinsman, and entitled to receive was not sufficient to qualify him to be an *aire*. In this case the family did not divide the inheritance, but remained together as "a joint and undivided family," one of the members being elected chief of the family or household, and in

---

1 The following account of the Irish clan-system differs in some respects from that given in an article on CLAN in *Dictionary of National Biography*.
this capacity enjoyed the rights and privileges of an aire. Sir H. S. Maine directed attention to this kind of family as an important feature of the early institutions of all Indo-European nations. Beside the “joint and undivided family,” there was another kind of family which we might call “the joint family.” This was a partnership composed of three or four members of a sept whose individual wealth was not sufficient to qualify each of them to be an aire, but whose joint wealth qualified one of the co-partners as head of the joint family to be one.

So long as there was abundance of land each family grazed its cattle upon the tribe-land without restriction; unequal increase of wealth and growth of population naturally led to its limitation, each head of a homestead being entitled to graze an amount of stock in proportion to his wealth, the size of his homestead, and his acquired position. The arable land was no doubt apportioned annually at first; gradually, however, some of the richer families of the tribe succeeded in evading this exchange of allotments and converting part of the common land into an estate in sevity. Septs were at first colonies of the tribe which settled on the march-land; afterwards the conversion of part of the march-land into an estate in sevity enabled the family that acquired it to become the parent of a new sept. The same process might, however, take place within a sept without dividing it; in other words, several members of the sept might hold part of the land of the sept as separate estates. The possession of land in sevity introduced an important distinction into the tribal system—it created an aristocracy. An aire whose family held the same land for three generations was called a flath, or lord, of which rank there were several grades according to their wealth in land and chattels. The aires whose wealth consisted in cattle only were called bá-aires, or cow-aires, of whom there were also several grades, depending on their wealth in stock. When a bá-aire had twice the wealth of the lowest class of flath he might enclose part of the land adjoining his house as a lawn; this was the first step towards his becoming a flath. The relations which subsisted between the flathis and the bá-aires formed the most curious part of the Celtic tribal system, and threw a flood of light on the origin of the feudal system. Every tribesman without exception owed his ceiste to the flath, or chief, that is, he was bound to become his ceiste, or vassal. This consisted in paying the flath a tribute in kind, for which the ceiste was entitled to receive a proportionate amount of stock without having to give any bond for their return, giving him service, e.g., in building his dun, or stronghold, reaping his harvest, keeping his roads clean and in repair, killing wolves, and especially service in the field, and doing him homage three times while seated every time he made his return of tribute. Paying the “calpe” to the High chief representatives of this kind of vassalage, a copddach or heir being in many cases the amount of food-rent paid by a free or saer ceiste. A tribesman might, however, if he pleased, pay a higher rent on receiving more stock together with certain other chattels for which no rent was chargeable. In this case he entered into a contract, and was therefore a bond or daer ceiste. No one need have accepted stock on these terms, nor could he do so without the consent of his chief, and he might free himself at any time from his obligation by returning what he had received, and the rent due on it.

What every one was bound to do to his flath, or chief, he might do voluntarily to the flath of his sept, to any flath of the tribe, or even to one of another tribe. He might also become a bond ceiste. In either case he might renounce his ceiste by returning a greater or lesser amount of stock than what he had received according to the circumstances under which he terminated his vassalage. In cases of disputed succession to the chieftship of a tribe the rival claimants were always anxious to get as many as possible to become their vassals. Hence the anxiety of minor chieftains, in later times in the Highlands of Scotland, to induce the clansmen to pay the “calpe” where there happened to be a doubt as to who was entitled to be chief.

The effect of the custom of gavel-kind was to equalize the wealth of each and leave no one wealthy enough to be chief.

The “joint and undivided family” and the formation of “joint families,” or gills, was one way of obviating this result; another way was the custom of tanistry. The headship of the tribe was practically confined to the members of one family; this was also the case with the headship of a sept. Sometimes a son succeeded his father, but the rule was that the eldest and most capable member of the gileage, that is, the relatives of the actual chief to the fifth degree, was selected during his lifetime to be his successor—generally the eldest surviving brother or son of the preceding chief. The man selected as successor to a chief of a tribe, or chieftain of a sept, was called the tanist, and should be “the most experienced, the most noble, the most wealthy, the wisest, the best informed, the most popular, the most powerful to oppose, the most steadfast to sue for profits and (be sued) for losses.” In addition to these qualities he should be free from personal blemishes and deformities and of fit age to lead his tribe or sept, as the case may be, to battle.  

So far as selecting the man of the gileage who was supposed to possess all these qualities, the office of chief of a tribe or chieftain of a sept was elective, but as the gileage was represented by four members of the chief or chieftain, in the election was practically confined to one of the four. In order to support the dignity of the chief or chieftain a certain portion of the tribe or sept land was attached as an anapage to the office; this land, with the duns or fortified residences upon it, went to the successor, but a chief’s own property might be gavelled. This custom of tanistry applied at first probably to the selection of the successors of a ríg, but was gradually so extended that even a bá-aire had a tanist.

A sept might have only one flath, or lord, connected with it, or might have several. It sometimes happened, however, that a sept might be so broken and reduced as not to have even one man qualified to rank as a flath. The rank of a flath depended upon the number of his ceilis, that is, upon his wealth. The flath of a sept, and the highest when there was more than one, was ceann féin, or head of the sept, or as he was usually called in Scotland, the chieftain. He was also called the flath gileage, or head of the gileage, that is, the kinmen to the fifth degree from among whom should be chosen the tanist, and who, according to the custom of gavel-kind, were the immediate heirs who received the personal property and were answerable for the liabilities of the sept. The flathis of the different septs were the vassals of the flath, or chief of the tribe, and performed certain functions which were no doubt at first individual, but in time became the hereditary right of the sept. One of those was the office of maer, or steward of the chief’s rents, &c.; and another that of aire tuisi, leading aire, or taonisich, a word cognate with the Latin duc-is or dux, and Anglo-Saxon here-tog, leader of the “here,” or army. The taonisich was leader of the tribe in battle; in later times the term seems to have been extended to several offices of rank. The cadet of a Highland clan was always called the taonisich, which has been translated captain; after the conquest of Wales the same term, tywysaug, was used for a ruling prince. Slavery was very common in Ireland and Scotland;  

1 The explanation here given of gileage is different from that given in the introduction to the third volume of the Ancient Laws of Scotland, 1844, by Sir Henry Maine, in his account of it in his Early History of Institutions, and which the present writer believes to be erroneous.

2 It should also be mentioned that illegitimacy was not a bar. The issue of “handfasting” marriages in Scotland were eligible to be chiefs, and even sometimes claimed under feudal law.

3 This office is of considerable importance in connexion with early Scottish history. In the Irish annals the ríg, or chief of a great tribe, such as O’Dwyer of Ross, Macdonald of Scon, or Mackay of Buchan, &c., is called a mor maer, or great maer. Sometimes the same person is called king also in these annals. Thus Fiaidh, or Finlay, son of Ruadhri, the father of Shakespeare’s Macbeth, is called king of Moray in the latter part of the twelfth century. The term is never found in Scottish charters, but it occurs in the Book of the Abbey of Deir in Buchan, now in the library of the university of Cambridge. The Scots kings and their successors obviously regarded the chiefs of the great tribes in question merely as their maers, while their tribesmen only knew them as kings. From these “mor-maerships,” which corresponded with the ancient mor tuatha, came most, if not all, the ancient Scottish earldoms.
in the former slaves constituted a common element in the stipends or gifts which the higher kings gave their vassal sub-reguli. Female slaves, who were employed in the houses of chiefs and flaiths in grinding meal with the hand-mill or quern, and in other domestic work, must have been very common, for the unit or standard for estimating the wealth of a bó-aire, bloodines, &c., was called a cumhal, the value of which was three cows, but which literally meant a female slave. The descendants of those slaves, prisoners of war, forfeited hostages, refugees from other tribes, broken tribesmen, &c., gathered round the residence of the ríg and flaiths, or squatted upon their marclands, forming a motley band of retainers which made a considerable element in the population, and one of the chief sources of the wealth of chiefs and flaiths. The principal source of their income was the food-rent paid by ceiles, and especially by the daér or bond ceiles, who were hence called biathaachs, from biaid, food. A flaith, but not a ríg, might, if he liked, go to the house of his ceile and consume his food-rent in the house of the latter.

Under the influence of feudal ideas and the growth of the modern views as to ownership of land, the chiefs and other lords of clans claimed in modern times the right of best owning the tribe-land as turcrec, instead of stock, and receiving rent not for cattle and other chattels as in former times, but proportionate to the extent of land given to them. The turcrec-land seems to have been at first given upon the same terms as turcrec-stock, but gradually a system of short leases grew up; sometimes, too, it was given on mortgage. In the Highlands of Scotland ceiles who received turcrec-land were called "taksmen." On the death of the chief or lord, his successor either bestowed the land upon some person or gave it to some other relative. In this way in each generation new families came into possession of land, and others sank into the mass of mere tribesmen. Sometimes a "taksmen" succeeded in acquiring his land in perpetuity, by gift, purchase or purchase, or even by the "strong hand." The universal prevalence of exchangeable allottments, or the rundale system, shows that down to even comparatively modern times some of the land was still recognized as the property of the tribe, and was cultivated in village communities.

The chief governed the clan by the aid of a council called the sobaid (sab, a prop), but the chief exercised much power, especially over the miscellaneous body of non-tribesmen who lived on his own estate. This power seems to have extended to life and death. Several of the flaiths, perhaps, all heads of septs, also possessed somewhat extensive powers of the same kind.

The Celtic dress, at least in the middle ages, consisted of a kind of shirt reaching to a little below the knees called a lenn, a jacket called an inar, and a garment called a brat, consisting of a single piece of cloth. This was apparently the garb of the aires, who appear to have been further distinguished by the number of colours in their dress, for we are told that while a slave had clothes of one colour, a ríg tuatha, or chief of a tribe, had five, and an ollamh and a superior king six. The breeches were also known, and cloaks with a cowl or hood, which buttoned up tight in front. The lenn was the modern kilt, and the brat the plaid, so that the dress of the Irish and Welsh in former times was the same as that of the Scottish Highlander.

By the abolition of the heritable jurisdiction of the Highland chiefs, and the general disarmament of the clans by the acts passed in 1747 after the rebellion of 1745, the clan system was practically broken up, though its influence still lingers in the more remote districts. An act was also passed in 1747 forbidding the use of the Highland garb; but the injustice and impolicy of such a law being generally felt it was afterwards repealed.

CLANRICARDE, Ulick de Burgh (Bourke or Burke), 1st Earl of (d. 1544), styled MacWilliam, and Ne-gan or Na-gCean (i.e. "of the Heads," "having made a mount of the heads of men slain in battle which he covered up with earth"), was the son of Richard or Rickard de Burgh, lord of Clanricarde, by a daughter of Madden of Portumna, and grandson of Ulick de Burgh, lord of Clanricarde (1497-1547), the collateral heir male of the earls of Ulster. On the death of the last earl in 1533, his only child Elizabeth had married Lionel, duke of Clarence, and the earldom became merged in the crown, in consequence of which the de Burghs abjured English laws and sovereignty, and chose for their chiefs the sons of Sir William, the "Red" earl of Ulster’s brother, the elder William taking the title of MacWilliam Eighter (Uachtar, i.e. Upper), and becoming the ancestor of the earls of Clanricarde, and his brother Sir Edmond that of Mac-William Oughtor (Ochtar, i.e. Lower), and founding the family of the earls of Mayo. In 1361 the duke of Clarence was sent over as lord-lieutenant to Ireland to enforce his claims as husband of the heir general, but failed, and the chiefs of the de Burghs maintained their independence of English sovereignty for several generations. Ulick de Burgh succeeded to the headship of his clan, exercised a quasi-royal authority and held vast estates in counties Galway, in Connaught, including Loughry, Dunkellin, Kil-tartan (Hilltaraght) and Athenry, as well as Clare and Leitrim. In March 1541, however, he wrote to Henry VIII., lamenting the degeneracy of his family, "which have been brought to Irish and disobedient rule by reason of marriage and nursing with those Irish, sometime rebels, near adjoining to me," and placing himself and his estates in the king's hands. The same year he was present at Dublin, when the act was passed making Henry VIII. king of Ireland. In 1543, in company with other Irish chiefs, he visited the king at Greenwich, made full submission, undertook to introduce English manners and abandon Irish names, received a regrant of the greater part of his estates with the addition of other lands, was confirmed in the captainship and rule of Clanricarde, and was created on the 1st of July 1543 earl of Clanricarde and baron of Dunkellin in the peerage of Ireland, with unusual ceremony. "The making of McWilliam earl of Clanricarde made all the country during his time quiet and obedient," states Lord Chancellor Cusack in his review of the state of the country in 1543. He did not live long, however, to enjoy his new English dignities, but died shortly after returning to Ireland about March 1544. He is called by the annalist of Loch Cé "a haughty and proud lord," who reduced many under his yoke, and by the Four Masters "the most illustrious of the English in Connaught." Clanricarde married (1) Gracy or Grace, daughter of Mulrone O'Carroll, "prince of Ely," by whom he had Richard or Rickard "the Saxon," who succeeded him as 2nd earl of Clanricarde (grandfather of the 4th earl, whose son became marquess of Clanricarde), this alliance being the only one declared valid. After parting with his first wife he married (2) Honora, sister of Ulick de Burgh, from whom he also parted. He married (3) Mary Lynch, by whom he had John, who claimed the earldom in 1568. Other sons, according to Burke's Peerage, were Thomas "the Athlete," shot in 1545, Redmond "of the Broom" (d. 1595), and Edmund (d. 1597).

CLANRICARDE, Ulick de Burgh (Bourke or Burke), Marquess of (1604-1657 or 1658), son of Richard, 4th earl of Clanricarde, created in 1628 earl of St Albans, and of Frances, daughter and heiress of Sir Francis Walsingham, and widow of Sir Philip Sidney and of Robert Devereux, earl of Essex, was born in 1604. He was summoned to the House of Lords as Lord Burgh in 1628, and succeeded his father as 5th earl in 1635. He sat in the Short Parliament of 1640 and attended Charles I. in the Scottish expedition. On the outbreak of the Irish rebellion Clanricarde had powerful inducements for joining the Irish and adhering to his family, his devotion to the Roman Catholic Church, and strongest of all, the ungrateful treatment meted out by Charles I. and Wentworth to his father, one of Elizabeth's most stanch adherents in Ireland, whose lands were appropriated by the crown and whose death, it was popularly

Cal. of State Pap., Carew MSS. 1515-1574, p. 246.
asserted, was hastened by the harshness of the lord-lieutenant. Nevertheless at the crisis his loyalty never wavered. Alone of the Irish Roman Catholic nobility to declare for the king, he returned to Ireland, took up his residence at Portumna, kept Galway, which he was governor, neutral, and took measures for the defence of the county and for the relief of the Protestants, making "his house and towns a refuge, nay, even a hospital for the distressed English." 1 In 1643 he was one of the commissioners appointed by the king to confer with the Irish confederates, and urged the wisdom of a cessation of hostilities in a document which he publicly distributed. He was appointed commander of the English forces in Connaught in 1644, and in 1646 was created a marquess and a privy councillor. He supported the same year the treaty between Charles I. and the confederates, and endeavoured after its failure to persuade Preston, the general of the Irish, to agree to a peace; but the latter, being advised by Rinuccini, the papal nuncio, refused in December. Together with Ormonde, Clanricarde opposed the nuncio's policy; and the royalist inhabitants of Galway having through the latter's influence rejected the cessation of hostilities, arranged with Lord Inchiquin in 1648, he besieged the town and compelled its acquiescence. In 1649 he reduced Sligo. On Ormonde's departure in December 1650 Clanricarde was appointed deputy lord-lieutenant, but he was not trusted by the Roman Catholics, and was unable to stem the tide of the parliamentary successes. In 1651 he opposed the offer of Charles, duke of Lorraine, to supply money and aid on condition of being acknowledged "Protector" of the kingdom. In May 1652 Galway surrendered to the parliament, and in June Clanricarde signed articles with the parliamentary commissioners which allowed his departure from Ireland. In August he was excepted from pardon for life and estate, but by permits, renewed from time to time by the council, he was enabled to remain in England for the rest of his life, and in 1653 £500 a year was settled upon him by the council of state in consideration of the protection which he had given to the Protestants in Ireland at the time of the rebellion. He died at Somerhill in Kent in 1657 or 1658 and was buried at Tunbridge.

The "great Earl," as he was called, supported Ormonde in his desire to unite the English royalists with the more moderate Roman Catholics on the basis of religious toleration under the authority of the sovereign, against the papal scheme advocated by Rinuccini, and in opposition to the parliamentary and Puritan policy. By the author of the Aphoristical Discovery, who represents the opinion of the native Irish, he is denounced as the "masterpiece of the treasonable faction," "a foe to his king, nation and religion," and by the duke of Lorraine as "a traitor and a base fellow"; but there is no reason to doubt Clarendon's opinion of him as "a person of unquestionable fidelity ... and of the most eminent constancy to the Roman Catholic religion of any man in the three kingdoms," or the verdict of Hallam, who describes him "as perhaps the most unsullied character in the annals of Ireland.

He married Lady Anne Compton, daughter of William Compton, 1st earl of Northampton, but had issue only one daughter. On his death, accordingly, the marquessate and the English peerages became extinct, the Irish titles reverting to his cousin Richard, 6th earl, grandson of the 3rd earl of Clanricarde. Henry, the 12th earl (1742-1797), was again created a marquess in 1789, but the marquessate expired at his death without issue, the earldom going to his brother. In 1825 the 14th earl (1802-1874) was created a marquis; he was ambassador at St Petersburg, and later postmaster-general and lord privy seal, and married George Canning's daughter. His son (b. 1832), who achieved notoriety in the Irish land agitation, succeeded him as and marquess.

CLANVOWE—CLAPARÈDE

Marquis of Clanricarde, by John, 11th earl (1757); Life of Ormonde, by T. Carte (1851); S. R. Gardiner's Hist. of the Civil War and of the Commonwealth; Thomson Tracts (Brit. Mus.) E 371 (11), 456 (10); Cal. of State Papers, Irish, esp. Introd. 1653-1647 and Heavenites; Hist. MSS. Comm., MSS. of Marq. of Ormonde and Earl of Egremont (P. C. V.).

CLANVOWE, SIR THOMAS, the name of an English poet first mentioned in the history of English literature by F. S. Ellis in 1806, when in editing the text of The Book of Cupid, God of Love or The Cuckoo and the Nightingale, for the Kelmscott Press, he stated that Professor Skeat had discovered that at the end of the best of the MSS. the author was called Clanvowe. In 1897 this information was confirmed and expanded by Professor Skeat in the supplementary volume of his Clarendon Press Chaucer (1894-1897). The beautiful romance of The Cuckoo and the Nightingale was published by Thynne in 1532, and was attributed by him, and by successive editors down to the days of Henry Bradshaw, to Chaucer. It was due to this error that for three centuries Chaucer was supposed to be identified with the manor of Woodstock, and even painted, in fanciful pictures, as lying

"Under a maple that is fair and green,
Before the chamber-window of the Queen
At Woodstock, upon the green lea."

But this queen could only be Joan of Navarre, who arrived in 1403, three years after Chaucer's death, and it is to the spring of that year that Professor Skeat attributes the composition of the poem. Sir Thomas Clanvowe was of a Herefordshire family, settled near Wigmore. He was a prominent figure in the reigns of Richard II. and Henry IV., and is said to have been a friend of Prince Hal. He was one of those who "had begun to mell of Lollardy, and drink the gall of heresy." He was one of the twenty-five knights who accompanied John Beaufort (son of John of Gaunt) to Barbary in 1396.

The date of his birth is unknown, and his name is last mentioned in 1404. The historic and literary importance of The Cuckoo and the Nightingale is great. It is the work of a poet who had studied the prosody of Chaucer with more intelligent care than either Ocecle or Lydgate, and who therefore forms an important link between the 14th and 15th centuries in English poetry. Clanvowe writes with a surprising delicacy and sweetness, in a five-line measure almost peculiar to himself. Professor Skeat points out a unique characteristic of Clanvowe's versification, namely, the unprecedented freedom with which he employs the suffix of the final -e, and rather avoids than seeks elision. The Cuckoo and the Nightingale was imitated by Milton in his sonnet to the Nightingale, and has been rewritten in modern English by Wordsworth. It is a poem of so much individual beauty, that we must regret the apparent loss of everything else written by a poet of such unusual talent.

See also a critical edition of The Bole of Cupide by Dr Erich Volmer (Berlin, 1898).

CLAPARÈDE, JEAN LOUIS RENÉ ANTOINE ÉDÔURD (1832-1876), Swiss naturalist, was born at Geneva on the 24th of April 1832. He belonged to a French family, some members of which had taken refuge in that city after the revocation of the Edict of Nantes. In 1852 he began to study medicine and natural science at Berlin, where he was greatly influenced by J. Müller and C. G. Ehrenberg, the former being at that period engaged in his important researches on the Echinoderms. In 1855 he accompanied Müller to Norway, and there spent two months on a desolate reef that he might obtain satisfactory observations. The latter part of his stay at Berlin he devoted, along with J. Lachmann, to the study of the Infusoria and Rhizopods. In 1857 he obtained the degree of doctor, and in 1862 he was chosen professor of comparative anatomy at Geneva. In 1859 he visited England, and in company with W. B. Carpenter made a voyage to the Hebrides; and in 1863 he spent some months in the vicinity of Biscay. On the appearance of Darwin's work on the Origin of Species, he adopted his theories and published a valuable series of articles on the subject in the Revue Génerique (1861). During 1865 and 1866 ill-health rendered him incapable of work, and he determined to pass the winter of 1866-1867 in

BIBLIOGRAPHY.—See the article "Burgh, Ulick de," in the Dict. of Nat. Biography, and authorities there given; Hist. of the Irish Conf. of 1549, by R. Bellings, ed. by J. T. Gilbert (1882); Aphoristical Discovery (Irish Archaeological Society, 1879); Memoirs of the Marquis of Clanricarde (1722, repr. 1744); Memoirs of Ulick,
Naples. The change of climate produced some amelioration, and his energy was attested by two elaborate volumes on the Annelidae of the Gulf. He again visited Naples with advantage in 1868; but in 1870, instead of recovering as before, he grew worse, and on the 31st of May he died at Siena on his way home. His Recherches sur la structure des annélides solitaires were published posthumously in 1873.

CLAPPERTON, HUGH (1788–1827), Scottish traveller in West-Central Africa, was born in 1788 at Annan, Dumfriesshire, where his father was a surgeon. He gained some knowledge of practical mathematics and navigation, and at thirteen was apprenticed on board a vessel which traded between Liverpool and North America. After having made several voyages across the Atlantic he was impressed for the navy, in which he soon rose to the rank of midshipman. During the Napoleonic wars he saw a good deal of active service, and at the storming of Port Louis, Mauritius, in November 1810, he was first in the breach and baulked down the French flag. In 1814 he went to Canada, was promoted to the rank of lieutenant, and to the command of a schooner on the Canadian lakes. In 1817, when the flotilla on the lakes was dismantled, he returned home on half-pay.

In 1820 Clapperton removed to Edinburgh, where he made the acquaintance of Walter Oudney, M.D., who aroused in him an interest in African travel. Lieut. G. F. Lyon, R.N., having returned from an unsuccessful attempt to reach Bornu from Tripoli, the British government determined on a second expedition to that country. Dr Oudney was appointed by Lord Bathurst, then colonial secretary, to proceed to Bornu as consul with the object of promoting trade, and Clapperton and Major Dixon Denham (q.v.) were added to the party. From Tripoli, early in 1822, they set out southward to Murzuk, and from this point Clapperton and Oudney visited the Ghat oasis. Kuka, the capital of Bornu, was reached in February 1823, and Lake Chad seen for the first time by Europeans. At Bornu the travellers were well received by the sultan; and after remaining in the country till the 14th of December they again set out for the purpose of exploring the course of the Niger. At Murmur, on the road to Kano, Oudney died (January 1824). Clapperton continued his journey alone through Kano to Sokoto, the capital of the Fula empire, where by order of Sultan Bello he was obliged to stop, though the Niger was only five days' journey to the west. Worn out with his travel he returned by way of Zaria and Katsena to Kuka, where he again met Denham. The two travellers then set out for Tripoli, reached on the 26th of January 1825. An account of the travels was published in 1826 under the title of Narrative of Travels and Discoveries in Northern and Central Africa in the years 1822–1824.

Immediately after his return Clapperton was raised to the rank of commander, and sent out with another expedition to Africa, the sultan Bello of Sokoto having professed his eagerness to open up trade with the west coast. Clapperton landed at Badagry in the Bight of Benin, and started overland for the Niger on the 7th of December 1825, having with him his servant Richard Landor (q.v.), Captain Pearce, R.N., and Dr Morrison, naval surgeon and naturalist. Before the month was out Pearce and Morrison were dead of fever. Clapperton continued his journey, and, passing through the Yoruba country, in January 1826 he crossed the Niger at Bussa, the spot where Mungo Park had died twenty years before. In July he arrived at Kano. Thence he went to Sokoto, intending afterwards to go to Bornu. The sultan, however, detained him, and being seized with dysentery he died near Sokoto on the 13th of April 1827.

Clapperton was the first European to make known from personal observation the semi-civilized Haussa countries, which he visited soon after the establishment of the Sokoto empire by the Fula. In 1820 appeared the Journal of a Second Expedition into the Interior of Africa, &c., by the late Commander Clapperton, to which was prefixed a biographical sketch of the explorer by his uncle, Lieut.-colonel S. Clapperton. Lander, who had brought back the journal of his master, also published Records of Captain Clapperton's Last Expedition to Africa... with the subsequent Adventures of the Author (2 vols., London, 1830).

CLAUDE or CLAQUE (Fr. clauquer, to clap the hands), an organized body of professional applauders in the French theatres. The hiring of persons to applaud dramatic performances was common in classical times, and the emperor Nero, when he acted, had his performance tested by an encomium chanted by five thousand of his soldiers, who were called Angustals. The recollection of this gave the 16th-century French poet, Jean Daurat, an idea which has developed into the modern claque. Buying up a number of tickets for a performance of one of his plays, he distributed them gratuitously to those who promised publicly to express their approbation. It was not, however, till 1820 that a M. Sauton seriously undertook the systematization of the claue, and opened an office in Paris for the supply of claueurs. By 1830 the claue had become a regular institution. The manager of a theatre sends an order for any number of claueurs. These people are usually under a chef de claue, whose duty it is to judge where their efforts are needed and to start the demonstration of approval. This takes several forms. Thus there are commissaires, those who learn the piece by heart, and call the attention of their neighbours to its good points between the acts. The rieurs are those who laugh loudly at the jokes. The pleureurs, generally women, feign tears, by holding their handkerchiefs to their eyes. The chanteurs keep the audience in a good humour, while the bisseurs simply clap their hands and cry bis! bis! to secure encores.

CLAVER, SAINT (1504–1553), foundress of the Franciscan nuns, was born of a knightly family in Assisi in 1504. At eighteen she was so impressed by a sermon of St Francis that she was filled with the desire to devote herself to the kind of life he was leading. She obtained an interview with him, and to test her resolution he told her to dress in penitential sackcloth and beg alms for the poor in the streets of Assisi. Clara readily did this, and Francis, satisfied as to her vocation, told her to come to the Portiuncula arrayed as a bride. The nuns met her with lighted candles, and at the foot of the altar Francis shook off her hair, received her vows of poverty, chastity and obedience, and invested her with the Franciscan habit, 1212. She placed her for a couple of years in a Benedictine convent in Assisi, until the convent at St Damian's, close to the town, was ready. Her two younger sisters, and, after her father's death, her mother and many others joined her, and the Franciscan nuns spread widely and rapidly (see CLARE, POOR). The relations of friendship and sympathy between St Clara and St Francis were very close, and there can be no doubt that she was one of the truest heirs of Francis's inmost spirit. After his death Clara threw herself wholly on the side of those who opposed mitigations in the rule and manner of life, and she was one of the chief upholders of St Francis's primitive idea of poverty (see FRANCISCANS). She was the close friend of Brother Leo and the other "Companions of St Francis," and they assisted at her death. For forty years she was abess at St Damian's, and the great endeavour of her life was that the rule of the nuns should be purged of the foreign elements that had been introduced, and should become wholly conformable to St Francis's spirit. She lived just long enough to witness the fulfilment of her great wish, a rule such as she desired being approved by the pope two days before her death on the 11th of August 1253.

The sources for her life are to be found in the Bollandist Acta Sanctorum on the 11th of August, and sketches in such Lives of the Saints as Alban Butler's. See also Wetzer und Welte, Kirchenlexicon (2d ed.), art. "Clare." (E. C. B.)

CLARE, the name of a famous English family. The ancestor of this historic house, "which played," in Freeman's words, "so great a part alike in England, Wales and Ireland," was Sir Richard Clary, the illegitimate son of Richard the Fearless, duke of Normandy. His son, Constable Gilbert de Clare, had two sons, Richard, lord of Biewenfa and Orbex, and Baldwin, lord of Le Sap and Meules, both of whom accompanied the Conqueror to England. Baldwin, known as "De Meules" or "of Exeter," received the hereditary shrievalty of Devon with great estates in the West Country, and left three sons, William, Robert and Richard, of whom the first and last were in turn
CLARE, J.

squires of Devon. Richard, known as "de Bienfaite," or "of Tunbridge," or "of Clare," was the founder of the house of Clare.

Richard derived his English appellation from his strongholds at Tunbridge and at Clare, at both of which his castle-mounds still remain. The latter, on the borders of Essex and Suffolk, was the head of his great "honour" which lay chiefly in the eastern counties. Appointed joint justiciar in the king's absence abroad, he took a leading part in suppressing the revolt of 1075. By his wife, Roeshe, daughter of Walter Giffard, through whom great Giffard estates afterwards came to his house, he left five sons and two daughters. Roger was his heir in Normandy, Walter founded Tintern Abbey, Richard was a monk, and Robert, receiving the forfeited fief of the Baynards in the eastern counties, founded, through his son Walter, the house of Fitz-Walter (extinct 1432), of whom the most famous was Robert Fitz-Walter, the leader of the barons against King John. Of this house, spoken of by Jordan Fantosme as "Clareaux," the Daventry of Daventry (extinct 1380) and Fawsley's of Fawsley (extinct 1392) were ceded. One of Richard's two daughters married the famous Walter Tiris.

Gilbert, Richard's heir in England, held his castle of Tunbridge against William Rufus, but was taken and was received into the king's grace. Under Henry the second of England, who favoured the Clares, he obtained a grant of Cardigan, and carried his arms into Wales. Dying about 1115, he left four sons, of whom Gilbert, the second, inherited Chester, with Nether-Gwent, from his uncle, Walter, the founder of Tintern, and was created earl of Pembroke by Stephen about 1138; he was father of Richard Strongbow, earl of Pembroke (q.v.).

The youngest son Baldwin fought for Stephen at the battle of Lincoln (1141) and founded the priories of Bourne and Deeping on lands acquired with his wife. The eldest son Richard, who was slain by the Welsh on his way to Cardigan in 1135 or 1136, left two sons Gilbert and Roger, of whom Gilbert was created earl of Hertfordshire by Stephen.

It was probably because he and the Clares had no interests in Hertfordshire that they were loosely and usually styled the earls of (de) Clare. Dying in 1152, Gilbert was succeeded by his brother Roger, of whom Fitz-Stephen observes that "nearly all the nobles of England were related to the earl of Clare, whose sister, the most beautiful woman in England, had long been desired by the king" (Henry II.). He was constantly fighting for his family in Wales and quarrelling with Becket over Tunbridge Castle. In 1173 or 1174, he was succeeded by his son Richard as third earl, whose marriage with Amicia, daughter and co-heir of William, earl of Gloucester, was destined to raise the fortunes of his house to their highest point. He and his son Gilbert were among the "barons of the Charter," Gilbert, who became fourth earl in 1217, obtained also, early in 1218, the earldom of Gloucester, with its great territorial "honour," and the lordship of Glamorgan, in right of his mother; "from this time the house of Clare became the acknowledged head of the barony." Gilbert had also inherited through his father his grandmother's "honour of St Hilary" and a moiety of the Giffard fief; but the vast possessions of his house were still further swollen by his marriage with a daughter of William (Marshal), earl of Pembroke, through whom his son Richard succeeded in 1245 to a fifth of the Marshall lands including the Kilkenny estates in Ireland. Richard's successor, Gilbert, the "Red" earl, died in 1295, the most powerful subject in the kingdom.

On his death his earldoms seem to have been somewhat mysteriously divided between his two sons, passed to his wife Joan, daughter of Edward I.; for her second husband, Ralph de Mohunther, was summoned to parliament in right of them from 1299 to 1306. After her death, however, in 1307, Earl Gilbert's son and namesake was summoned in 1308 as earl of Gloucester and Hertford, though only sixteen. A nephew of Edward II. and brother-in-law of Gaveston, he played a somewhat wavering part in the struggle between the king and the barons. Guardian of the realm in 1311 and regent in 1313, he fell gloriously at Bannockburn (June 24th, 1314), when only twenty-three, rushing on the enemy "like a wild boar, making his sword drunk with their blood."

The earl was the last of his mighty line, and his vast possessions in England (in over twenty counties), Wales and Ireland fell to his three sisters, of whom Elizabeth, the youngest, wife of John de Burgh, obtained the "honour of Clare" and transmitted it to her son William de Burgh, 3rd earl of Ulster, whose daughter brought it to Lionel, son of King Edward III., who was thereupon created duke of Clarence, a title associated ever since with the royal house. The "honour of Clare," vested in the crown, still preserves a separate existence, with a court and steward of its own.

Clare College, Cambridge, derived its name from the family, though whether from Richard Strongbow, or from Thomas de Clare, a younger son, who had a grant of Thomond in 1276, has been deemed doubtful.

Clareneux King of Arms, an officer of the heralds' college, derives his style, through Clare, from Clare.

CLARE, JOHN (1733-1864), English poet, commonly known as "the Northamptonshire Peasant Poet," the son of a farm labourer, was born at Helpstone near Peterborough, on the 13th of July 1793. At the age of seven he was taken from school to tend sheep and geese; four years later he began to work on a farm, attending in the winter evenings a school where he is said to have learnt some algebra. He then became a pot-boy in a public-house and fell in love with Mary Joyce, but her father, a prosperous farmer, forbade her to meet him. Subsequently he was gardener at Burghley Park. He enlisted in the militia, tried camp life with gipsies, and worked as a lime burner in 1817, but in the following year he was obliged to accept parish relief. Clare had bought a copy of Thomson's Seasons out of his scanty earnings and had begun to write poems. In 1819 a bookseller at Stamford, named Drury, lighted on one of Clare's poems, The Setting Sun, written on a scrap of paper enclosing a note to his predecessor in the business. He befriended the author and introduced his poems to the notice of John Taylor, of the publishing firm of Taylor & Hussey, who issued the poems descriptive of rural life and scenery in 1820. This book was highly praised, and in the next year his village minstrel and other poems were published. He was greatly patronized; fame, in the shape of curious visitors, broke the tenor of his life, and the convivial habits that he had formed were indulged more freely. He had married in 1820, and an annuity of 15 guineas from Lord Exeter, in whose service he had been, was supplemented by subscription, and he became possessed of £45 annually, a sum far beyond what he had ever earned, but new wants made his income insufficient, and in 1825 he was nearly penniless. The shepherd, calendar (1827) met with little success, which was not increased by his hawkong it himself. As he worked again on the fields his health temporarily improved; but he soon became seriously ill. Lord Byron was presented with a new cottage and a piece of ground, but Clare could not settle in his new home. Gradually his mind gave way. His last and best work, the rural music (1835), was noticed by "christopher North" alone. He had for some time shown symptoms of insanity; and in July 1837 he was removed to a private asylum, and afterwards to the northampton general lunatic asylum, where he died on the 20th of May 1864. Clare's descriptions of rural scenes show a keen and loving appreciation of nature, and his love-songs and ballads charm by their genuine feeling; but his vogue was no doubt largely due to the interest aroused by his humble position in life.
CLARE, LORD

See the Life of John Clare, by Frederick Martin (1865): and Life and Remains of John Clare, by J. L. Cherry (1873), which, though not so complete, contains some of the poet’s asylum verses and prose fragments.

CLARE, JOHN FITZGIBBON, 1ST EARL OF (1749–1802), lord chancellor of Ireland, was the second son of John Fitzgibbon, who had abandoned the Roman Catholic faith in order to pursue a legal career. He was educated at Trinity College, Dublin, where he was highly distinguished as a classical scholar, and at Christ Church, Oxford, where he graduated in 1770. In 1772 he was called to the Irish bar, and quickly acquired a very lucrative practice; he also inherited his father’s large fortune on the death of his elder brother. In 1778 he entered the Irish House of Commons as member for Dublin University, and at first gave a general support to the popular party led by Henry Grattan (q.v.). He was, however, from the first hostile to that part of Grattan’s policy which aimed at removing the disabilities of the Roman Catholics; he endeavoured to impede the Relief Bill of 1778 by raising difficulties about its effect on the Act of Settlement. He especially distrusted the priests, and many years later explained that his life-long resistance to all concession to the Catholics was based on his “unalterable opinion” that “a aristocratic Popish ecclesiastics never will become a well-attached subject to a Protestant state, and that the Pope’s clergy must always have a commanding influence on every member of that communion.” As early as 1780 Fitzgibbon began to separate himself from the popular or national party, by opposing Grattan’s declaration of the Irish parliament’s right to independence. There is no reason to suppose that in this change of view he was influenced by corrupt or personal motives. His cast of mind naturally inclined to authority rather than to democratic liberty; his hostility to the Catholic claims, and his distrust of parliamentary reform as likely to endanger the connexion of Ireland with Great Britain, made him a sincere opponent of the aims which Grattan had in view. In reply, however, to a remonstrance from his constituents Fitzgibbon promised to support Grattan’s policy in the future, and described the claim of Great Britain to make laws for Ireland as “a daring usurpation of the rights of a free people.”

For some time longer there was no actual breach between him and Grattan. Grattan supported the appointment of Fitzgibbon as attorney-general in 1783, and in 1785 the latter highly eulogized Grattan’s Popish ecclesiastics never will become a well-attacked subject to a Protestant state, and that the Pope’s clergy must always have a commanding influence on every member of that communion.”

However, in 1784 he was opposed to the appointment of Lord Fitzwilliam (q.v.) as viceroy in 1793, and was probably the chief influence in procuring his recall; and it was Fitzgibbon who first put it into the head of George III. that the king would violate his coronation oath if he consented to the admission of Catholics to parliament. When Lord Camden, Fitzwilliam’s successor in the viceroyalty, arrived in Dublin on the 31st of March 1795, Fitzgibbon’s carriage was violently assaulted by the mob, and he himself was wounded; and in the riots that ensued his house was also attacked. But as if to impress upon the Catholics the hopelessness of their case, the government who had made Fitzgibbon a viscount immediately after his attack on the Catholics in 1793 now bestowed on him a further mark of honour. In June 1795 he was created earl of Clare. On the eve of the rebellion he warned the government that while the combination of Britain and Ireland to enforce any proposal for removing the disabilities of the Catholics would be the objects aimed at by the better classes, the mass of the discontented would view “the separation of the country from her connexion with Great Britain, and a fraternal alliance with the French Republic.”

Clare advocated stringent measures to prevent an outbreak; but he was neither cruel nor immoderate, and was inclined to mercy in dealing with individuals. He attempted to save Lord Edward Fitzgerald (q.v.) from his fate by giving a friendly warning to his friends, and promising to facilitate his escape from the country; and Lord Edward’s aunt, Lady Louisa Conolly, who was conducted to his death-bed in prison by the chancellor in person, declared that “nothing could exceed Lord Clare’s kindness.”

His moderation and humanity after the rebellion was extolled by Cornwallis. He threw his great influence on the side of clemency, and it was through his intervention that Oliver Bond, when sentenced to death, was reprieved; and that an arrangement was made by which Arthur O’Connor, Thomas Emmet and other state prisoners were allowed to leave the country.

In October 1798 Lord Clare, who since 1793 had been convinced of the necessity for a legislative union if the connexion between Great Britain and Ireland was to be maintained, and who was equally determined that the union must be accompanied by Catholic emancipation, crossed to England and successfully pressed his views on Pitt. In 1799 he induced the Irish House of Lords to throw out a bill for providing a permanent endowment of Maynooth. On the 10th of February 1800 Clare in the House of Lords moved the resolution approving the union in a long and powerful speech, in which he reviewed the history of Ireland since the Revolution, attributing the evils of recent years to the independent constitution of 1782, and speaking of Grattan
in language of deep personal hatred. He was not aware of the assurance which Cornwallis had been authorized to convey to the Catholics that the union was to pave the way for emancipation, and when he heard of it after the passing of the act he bitterly complained that Pitt and Castlereagh had deceived him. After the union Clare became more violent than ever in his opposition to any policy of concession in Ireland. He died on the 28th of January 1802; his funeral in Dublin was the occasion of a riot organized “by a gang of about fourteen persons under orders of a leader.” His wife, in compliance with his death-bed request, destroyed all his papers. His two sons, John (1792-1851) and Richard Hobart (1793-1864), succeeded in turn to the earldom, which became extinct on the death of the latter, whose only son, John Charles Henry, Viscount Fitzgibbon (1829-1854), was killed in the charge of the Light Brigade at Balaklava.

Lord Clare was in private life an estimable and even an amiable man; many acts of generosity are related of him; the determination of his character swayed other wills to his purpose, and his courage was such as no danger, no obloquy, no public hatred or violence could disturb. Though not a great orator like Flood or Grattan, he was a skilful and ready debater, and he was by far the ablest Irish supporter of the union. He was, however, arrogant, overbearing and intolerant to the last degree. He was the first Irishman since the Revolution to hold the office of lord chancellor of Ireland. “Except where his furious personal antipathies and his ungovernable arrogance were called into action, he appears to have been,” says Lecky, “an able, upright and energetic judge”; but as a politician there can be little question that Lord Clare’s bitter and unceasing resistance to reasonable measures of reform did infinite mischief in the history of Ireland, by inflaming the passions of his countrymen, driving them into rebellion, and perpetuating their political and religious divisions.

(R. J. M.)

CLARE, a county in the province of Munster, Ireland, bounded N. by Galway Bay and Co. Galway, E. by Lough Derg, the river Shannon, and counties Tipperary and Limerick, S. by the estuary of the Shannon, and W. by the Atlantic Ocean. The area is 832,891 acres, or nearly 1332 sq. m. Although the surface of the county is hilly, and in some parts even mountainous, it nowhere rises to a great elevation. Much of the western baronies of Moyarta and Ibrickan is composed of bog land. Bogs are frequent also in the mountainous districts elsewhere, except in the limestone barony of Burren, the inhabitants of some parts of which supply themselves with turf from the opposite shore of Connamara. Generally speaking, the eastern parts of the county are mountainous, with tracts of rich pasture-land interspersed; the west abounds with bog; and the north is rocky and best adapted for grazing sheep. In the southern part, along the banks of the Fergus and Shannon, are the banks of rich low grounds called coccarses, of various breadth, indenting the land in a great variety of shapes. They are composed of deep rich loam, and are distinguished as the black coccarses, adapted for tillage, and the blue, used more advantageously as meadow land. The coast is in general rocky, and occasionally bold and precipitous in the extreme, as may be observed at the picturesque cliffs of Moher within a few miles of Ennistimon and Lisdoonvarna, which rise perpendicularly at O’Brien’s Tower to an elevation of 580 ft. The coast of Clare is indented with several bays, the chief of which are Ballyvaghan, Liscannor and Malbay; but from Black Head to Loop Head, that is, along the entire western boundary of the county, formed by the Atlantic, there is no safe harbour except Liscannor Bay. Malbay takes its name from its dangers to navigators, and the whole coast has been the scene of many fatal disasters. The county possesses only one large river, the Fergus; but nearly 100 m. of its boundary-line are washed by the river Shannon, which enters the Atlantic Ocean between this county and Kerry. The numerous bays and creeks on both sides of this great river render its navigation safe in every wind; but the passage to and from Limerick is often tedious, and the port of Kilrush has from that cause gained in importance. The river Fergus is navigable from the Shannon to the town of Clare, which is the terminating point of its natural navigation, and the port of all the central districts of the county.

There are a great number of lakes and tarns in the county, of which the largest are Loughs Muckanagh, Graney, Atedaun and Dromore; but they are more remarkable for beauty than for size or utility, with the exception of the extensive and navigable Lough Derg, formed by the river Shannon between this county and Tipperary. The salmon fishery of the Shannon, both as a sport and as an industry, is famous; the Fergus also holds salmon, and there is much good trout-fishing in the lakes for which Ennis is a centre, and in the streams of the Atlantic seaboard. Clare is a county which, like all the western counties of Ireland, repays visitors in search of the pleasures of seaside resorts, sport, scenery or antiquarian interest. Yet, again like other western counties, it was long before it was rendered accessible. Communications, however, are now satisfactory.

Geology.—Upper Carboniferous strata cover the country west of Ennis, the coast-sections in them being particularly fine. Shales and slates are frequent, as are also sandstones, but the slate is now thrown into striking folds. The Carboniferous Limestones form a barren terraced country, often devoid of soil, through the Burren in the north, and extends to the estuary of the Fergus and the Shannon in the south. On the east, the hilly country has been brought up from two bold masses of Old Red Sandstone, with Silurian corse. Sleeve Beragh, the range southerly of these, rises to 1746 ft. above Killaloe, and the hilly country here traversed by the Shannon is in marked contrast with the upper course of the river through the great limestone plain.

Minerals.—Although metals and minerals have been found in many places throughout the county, they do not often show themselves in sufficient abundance to induce the application of capital for their extraction. In the lead mines, which are chiefly found in the county, and between Lough Dunmore and Ballyvaughan, there is found a lead called lindsay, which, being thinly streaked with pyrites, is of no great value. The iron is found chiefly in the counties Clare, Limerick and Kerry, where it is formed into but a small quantity; and manganese, occurring with iron in a very small proportion, is found in the county with the iron. The minerals of Clare, however, are not of much importance, the county being particularly deficient in metals. The only minerals that are of much importance are the so-called galena, which is a lead ore, and the iron ore, which is found chiefly in the county of Limerick, and which is obtained from the Shannon. The iron ore is chiefly used in the manufacture of steel, and is also used in the manufacture of iron. The county is also rich in coal, which is found chiefly in the county of Limerick, and which is used in the manufacture of iron. The county is also rich in coal, which is found chiefly in the county of Limerick, and which is used in the manufacture of iron.

The county is also rich in coal, which is found chiefly in the county of Limerick, and which is used in the manufacture of iron.

Watering-places.—The Atlantic Ocean and the estuary of the Shannon afford many situations admirably adapted for summer bathing-places. Among the most frequented of these locations are Milltown Malbay; with one of the best beaches on the western coast; and the neighbouring Spanish Point (named from the scene of the wreck of two ships of the Armada). Leinich, about
2 m. from Ennistimon on Liscarrow, and near the interesting cliffs of Moher, has a magnificent beach. Kilkee is the most fashionable watering-place on the western coast of Ireland; and Kilrush on the Shannon estuary is also favoured.

Industries.—The soil and surface of the county are in general better adapted for grazing than for tillage, and the acreage devoted to the former consequently exceeds three times that of the latter. Agriculture is in a backward state, and not a fifth of the total area is under cultivation, while the acreage shows a decrease even in the principal crops of oats and potatoes. Cattle, sheep, poultry and pigs, however, all receive considerable attention. Owing to the mountainous nature of the county nearly one-seventh of the total area is quite barren.

There are no extensive manufactures, although flannels and fribes are made for home use, and hosiery of various kinds, chiefly coarse and strong, is made around Ennistimon and other places. There are several fishing stations on the coast, and cod, haddock, ling, sole, turbot, ray, mackerel and other fish abound, but the rugged nature of the coast and the tempestuous sea greatly hinder the operations of the fishermen. Near Pooleoddy is the great brown mussel bed called the Red Bank, where a large establishment is maintained, from which a constant supply of the excellent Red Bank oysters is furnished to the Dublin and other large markets. Crabs and lobsters are caught on the shores of the Bay of Galway in every creek from Black Head to Ardfry. In addition to the Shannon salmon fishery mentioned above, eels abound in every rivulet, and form an important article of consumption.

The Great Southern & Western railway line from Limerick to Sligo intersects the centre of the county from north to south. From Ennis on this line the West Clare railway runs to Ennistimon on the coast, where it turns south and follows the coast by Milltown Malbay to Kilkee and Kilrush. Killaloe in the east of the county is the terminus of a branch of the Great Southern & Western railway.

Population and Administration.—The population (126,244 in 1861; 112,334 in 1901) almost wholly Roman Catholic and rural shows a decrease among the most serious of the Irish counties, and the emigration returns are proportionately heavy.

The principal towns, all of insignificant size, are Ennis (pop. 5,003, the county town), Kilrush (4,179), Kilkee (1,661) and Killaloe (885); but several of the smaller settlements, as resorts, are of more than local importance.

The county, which is divided into 11 baronies, contains 79 parishes, and includes the Protestant diocese of Kilfenora, the great part of Killaloe, and a very small portion of the diocese of Limerick. It is within the Roman Catholic dioceses of Killaloe and Limerick. The assizes are held at Ennis, and quarter sessions here and at Ennistimon, Kilkee, Kilrush and Tulla.

The county is divided into the East and West parliamentary divisions, each returning one member.

History.—This county, together with part of the neighbouring district, was anciently called Thomond, that is, North Munster, and formed part of the monarchy of the celebrated Boroborne, who held his court at Kincoara near Killaloe, where his palace was situated on the banks of the Shannon. The site is still distinguished by extensive earthen ramparts. Settlements were effected by the Danes, and in the 13th century by the Anglo-Normans, but without permanently affecting the possession of the district by its native proprietors. In 1543 Murrogh O’Brien, after dispossessing his nephew and vainly attempting a rebellion against the English rule, proceeded to England and submitted to Henry VIII., resigning his name and possessions. He soon received them back by an English tenure, together with the title of earl of Thomond, on condition of adopting the English dress, manners and customs. In 1565 this part of Thomond (sometimes called O’Brien’s country) was added to Connaught, and made one of the six new counties into which that province was divided by Sir Henry Sidney. It was named Clare, the name being traceable either to Richard de Clare (Strongbow), earl of Pembroke, or to his younger brother, Thomas de Clare, who obtained a grant of Thomond from Edward I. in 1276, and whose family for some time maintained a precarious position in the district. Towards the close of the reign of Elizabeth, Clare was detached from the government of Connaught and given a separate administration; but at the Restoration it was reunited to Munster.

Antiquities.—The county abounds with remains of antiquities, both military and ecclesiastical, especially in the north-western part. There still exist above a hundred fortified castles, several of which are inhabited. They are mostly of small extent, a large portion being fortified dwellings. The chief of them is Bunratty Castle, built in 1277, once inhabited by the earls of Thomond, 10 m. W. of Limerick, on the Shannon. Those of Ballyknarvarga, Ballynacalan and Lemanagh, all in the north-west, should also be mentioned. Rath or encampments are to be found in every part. They are generally circular, composed either of large stones without mortar or of earth thrown up and surrounded by one or more ditches. The list of abbey and other religious houses formerly flourishing here (some now only known by name, but many of them surviving in ruins) comprehends upwards of twenty. The most remarkable are—Clonmacnoise, considered one of the finest and most perfect specimens of ancient monastic architecture in Ireland; Cong (St. Patrick’s), in which is a very fine window of uncommonly elegant workmanship; and those on Inniscattery or Scattery Island, in the Shannon, said to have been founded by St Senan (see Kilrush). Kilfenora, 5 m. N.E. of Ennistimon, was until 1725 a separate diocese, and its small cathedral is of interest, with several neighbouring crosses and a holy well. The ruined churches of Kilnaboy, Nouthavil and Teampl Cronan are the most noteworthy of many in the north-west. Five round towers are to be found in various stages of preservation—at Scattery Island, Drumcliffe, Dysert O’Dea, Kilnaboy and Innisaltra (Lough Derg). The cathedral of the diocese of Killaloe is at the town of that name. Cromlechs are found, chiefly in the rocky limestone district of Burren in the N.W., though there are some in other baronies. That at Ballygannor is formed of a stone 40 ft. long and 10 broad.

See papers by T. J. Westropp in Proceedings of the Royal Irish Academy—Distribution of Cromlechs in County Clare (1897); and “Churches of County Clare, and Origin of Ecclesiastical Divisions” (1900).

CLAREMONT, a city of Sullivan county, New Hampshire, U.S.A., situated in the W. part of the state, bordering on the Connecticut river. Pop. (1890) 5365; (1900) 6498 (1442 foreign-born); (1910) 7529. Area, 6 sq. m. It is served by two branches of the Boston & Maine railway. In Claremont is the Fiske free library (1873), housed in a Carnegie building (1904). The Stevens high school is richly endowed by the gift of Parin Stevens, a native of Claremont. The city contains several villages, the principal being Claremont, Claremont Junction and West Claremont. Sugar river, flowing through the city into the Connecticut and falling 223 ft. within the city limits, furnishes good water-power. Among the manufactures are woolen and cotton goods, paper, mining and quarrying machinery, rubber goods, linens, shoes, wood trim and pearl buttons. The first settlement here was made in 1762, and a township was organized in 1764; in 1808 Claremont was chartered as a town. It was named from Claremont, Lord Clive’s country place.

CLARENCE, DUKES OF. The early history of this English title is identical with that of the family of Clare (q.v.), earls of Gloucester, who are sometimes called earls of Clare, of which word Clarence is a later form. The first duke of Clarence was Lionel of Antwerp (see below), third son of Edward III., who was created duke in 1362, and whose wife Elizabeth was a direct descendant of the Clares, the “Honour of Clare” being among the lands which she brought to her husband. When Lionel died without sons in 1368 the title became extinct; but in 1412 it was revived in favour of Thomas (see below), the second son of Henry IV. The third creation of a duke of Clarence took place in 1461, and was in favour of George (see below), brother of the King Edward IV. When this duke, accused by
the king, was attainted and killed in 1478, his titles and estates were forfeited. There appears to have been no other creation of a duke of Clarence until 1789, when William, third son of Henry III., was made a peer under the title of Visconti, of Harfleur, and in 1482 Lionel, the elder son of King Edward VII., then prince of Wales, only to become extinct for the fifth time on his death in 1492.

Lionel of Antwerp, duke of Clarence (1338-1368), third son of Edward III., was born at Antwerp on the 29th of November 1338. Betrothed when a child to Elizabeth (d. 1363), daughter and heiress of William de Burgh, 3rd earl of Ulster (d. 1339), he was married to her in 1352; but before this date he had entered nominally into possession of her great Irish inheritance. Having been named as his father's representative in England in 1345 and again in 1346, Lionel was created earl of Ulster, and joined an expedition into France in 1355, but his chief energies were reserved for the affairs of Ireland. Appointed governor of that country, he landed at Dublin in 1361, and in November of the following year received the dukedom of Clarence, while his father made an abortive attempt to secure for him the crown of Scotland. His efforts to secure an effective authority over his Irish lands were only moderately successful; and after holding a parliament at Kilkenny, which passed the celebrated statute of Kilkenny in 1367, he threw up his task in disgust and returned to England. About this time a marriage was arranged between Clarence and Violante, daughter of Galeazzo Visconti, lord of Pavia (d. 1378); the enormous dowry which Galeazzo promised with his daughter being exaggerated by the rumour of the time. Journeying to fetch his bride, the duke was received in great state both in France and Italy, and was married to Violante at Milan in June 1368. Some months were then spent in festivities, during which Lionel was taken ill at Alba, where he died on the 7th of October 1368. His only child Philips, a daughter by his first wife, married, in 1368 Edmund Mortimer, 3rd earl of March (1332-1375), and through this union Clarence became the ancestor of Edward IV. The poet Chaucer was at one time a page in Lionel's household.

Thomas, duke of Clarence (c. 1388-1412), who was nominally lieutenant of Ireland from 1401 to 1413, and was in command of the English fleet in 1405, acted in opposition to his elder brother, afterwards King Henry V., and the Beauforts during the later part of the reign of Henry IV.; and was for a short time at the head of the government, leading an unsuccessful expedition into France in 1412. When Henry V., however, became king in 1413 no serious dissensions took place between the brothers, and as a member of the royal council Clarence took part in the preparations for the French war. He was with the English king at Harfleur, but not at Agincourt, and shared in the expedition of 1417 into Normandy, during which he led the assault on Caen, and distinguished himself as a soldier in other similar undertakings. When Henry V. returned to England in 1419, the duke remained in France as his lieutenant, and was killed at B成功 whilst rashly attacking the French and their Scottish allies on the 22nd of March 1421. He left no legitimate issue, and the title again became extinct.

George, duke of Clarence (1449-1478), younger son of Richard, duke of York, by his wife Cicely, daughter of Ralph Neville, 1st earl of Westmorland, was born in Dublin on the 21st of October 1449. Soon after his elder brother became king as Edward IV. in March 1461, he was created duke of Clarence, and his youth was no bar to his appointment as lord-lieutenant of Ireland in the following year. Having been mentioned as a possible husband for Mary, daughter of Charles the Bold, afterwards duke of Burgundy, Clarence came under the influence of Richard Neville, earl of Warwick, and in July 1469 was married at Calais to the earl's elder daughter Isabella. With his father-in-law he acted in a disloyal manner towards the king. Both supported the rebels in the north of England, and when their treachery was discovered Clarence was deprived of his office as lord-lieutenant and fled to France. Returning to England with Warwick in September 1470, he witnessed the restoration of Henry VI., when the crown was settled upon his son, and in that case the title of Henry's family became extinct. The good understanding, however, between Warwick and his son-in-law was not lasting, and Clarence was soon secretly reconciled with Edward. The public reconciliation between the brothers took place when the king was besieging Warwick in Coventry, and Clarence then fought for the Yorkists at Barnet and Tewkesbury. After Warwick's death in April 1471 Clarence appears to have seized the whole of the vast estates of the earl, and in March 1472 was created by right of his wife earl of Warwick and Salisbury. He was consequently greatly disturbed when he heard that his younger brother Richard, duke of Gloucester, was seeking to marry Warwick's younger daughter Anne, and was claiming some part of Warwick's lands. A violent quarrel between the brothers ensued, but Clarence was unable to prevent Gloucester from marrying, and in 1474 the king interfered to settle the dispute, dividing the estates between his brothers. In 1477 Clarence was again a suitor for the hand of Mary, who had just become duchess of Burgundy. Edward objected to the match, and Clarence, jealous of Gloucester's influence, left the court. At length Edward was convinced that Clarence was aiming at his throne. The duke was thrown into prison, and in January 1478 the king unfolded the charges against his brother to the parliament. He had slandered the king; had received oaths of allegiance to himself and his heirs; had prepared for a new rebellion; and was in short incorrigible. Both Houses of Parliament passed the bill of attainder, and the sentence of death which followed was carried out on the 17th or 18th of February 1478. It is uncertain what share Gloucester had in his brother's death; but soon after the event the rumour gained ground that Clarence had been drowned in a butt of malmsey wine. Two of the duke's children survived their father: Margaret, countess of Salisbury (1477-1541), and Edward, earl of Warwick (1475-1499), who passed the greater part of his life in prison and was beheaded in November 1499.

CLARENDEON, EDWARD HYDE, 1st EARL OF (1600-1674). English historian and statesman, son of Henry Hyde of Dinton, Wiltshire, a member of a family for some time established at Norbury, Cheshire, was born on the 8th of February 1609. He entered Magdalen Hall, Oxford, in 1622 (having been refused a demisyip at Magdalen College), and graduated B.A. in 1626. Intended originally for holy orders, the death of two elder brothers made him his father's heir, and in 1625 he entered the Middle Temple. At the university his abilities were more conspicuous than his industry, and at the bar his time was devoted more to general reading and to the society of eminent scholars and writers than to the study of law treatises. This wandering from the beaten track, however, was not without its advantages. In later years Clarendon declared "next the king, the royal household was the blessed house of God Almighty," that he "owed all the little he knew and the little he did to his love of books and to the friendship and conversation ... of the most excellent men in their several kinds that lived in that age." These included Ben Jonson, Selden, Waller, Hales, and especially Lord Falkland; and from their influence and the wide reading in which he indulged, he doubtless drew the solid learning and literary talent which afterwards distinguished him.

In 1629 he married his first wife, Anne, daughter of Sir George Ayliffe, who died six months afterwards; and secondly, in 1634, Frances, daughter of Sir Thomas Aylesbury, Master of Requests. In 1633 he was called to the bar, and obtained quickly a good position and practice. His marriages had gained for him influential friends, and in December 1634 he was made keeper of the writs and rolls of the common pleas; while his able conduct of the petition of the London merchants against Portland earned Laud's approval. He was returned to the Short Parliament in June 1629 for Dorset, and in 1631 for Lincoln; and in 1634 he was created a baronet, and entered on his high and arduous service to the crown as Lord Chief Justice of Jamaica.

1 Life, i. 25.
in 1640 as member for Wootton Bassett. Respect and veneration for the law and constitution of England were already fundamental principles with Hyde, and the flagrant violations and perversions of the law which characterized the twelve preceding years of absolute rule drove him into the ranks of the popular party. He served on numerous and important committees, and his parliamentary action was directed chiefly towards the support and restoration of the law. He assailed the jurisdiction of the earl marshal's court, and in the Long Parliament, in which he sat for Saltrew, renewed his attacks and practically effected its suppression. In 1641 he served on the committees for inquiring into the status of the councils of Wales and of the North, distinguished himself by a speech against the latter, and took an important part in the proceedings against the judges. He supported Strafford's impeachment, and did not vote against the attainder, subsequently making an unsuccessful attempt through Essex to avert the capital penalty. Hyde's allegiance, however, to the church of England was as staunch as his support of the law, and was soon to separate him from the popular faction. In February 1641 he opposed the reception of the London petition against episcopacy, and in May the project for unity of religion with the Scots, and the bill for the exclusion of the clergy from public office. He succeeded in his opposition to the Root and Branch Bill, and, though made chairman of the committee on the bill on the 11th of July in order to silence his opposition, he caused by his successful obstruction the failure of the measure. In consequence he was summoned to the king's presence, and encouraged in his attitude, and at the beginning of the second session was regarded as one of the king's ablest supporters in the Commons. He considered the claims put forward at this time by parliament as a violation and not as a guarantee of the law and constitution. He opposed the demand by the parliament to choose the king's ministers, and also the Grand Remonstrance, to which he wrote a reply published by the king.

He now definitely though not openly joined the royal cause, and refused office in January 1642 with Colepeper and Falkland in order to serve the king's interests more effectually. Charles undertook to do nothing in the Commons without their advice. Nevertheless a few days afterwards, without their knowledge and by the advice of Lord Digby, he attempted the arrest of the five members to be voted to forts which reduced Hyde to despair, and which indeed seemed to show that things had gone too far for an appeal to the law. He persevered, nevertheless, in his legal policy, to which Charles after the failure of his project again returned, joined the king openly in June, and continued to compose the king's answers and declarations in which he appealed to the "known Laws of the land" against the arbitrary and illegal acts of a seditious majority in the parliament, his advice to the king being "to shelter himself wholly under the law... presuming that the king and the law together would have been strong enough for any encounter." Hyde's appeal had great influence, and gained for the king's cause half the nation. It by no means, however, met with universal support among the royalists. Hobbes jeering at Hyde's love for "mixed monarchy," and the courtiers expressing their disapproval of the "spirit of accommodation" which wounded the regality. It was destined to failure owing principally to the invincible distrust of Charles created in the parliament leaders, and to the fact that Charles was simultaneously carrying on another and an inconsistent policy, listening to very different dictates, such as the queen and Digby, and resolving on measures (such as the attempt on Hull) without Hyde's knowledge or approval.

War, accordingly, in spite of his efforts, broke out. He was expelled the House of Commons on the 11th of August 1642, and was one of those excepted later from pardon. He showed great activity in collecting loans, was present at Edgehill, though not as a combatant, and followed the king to Oxford, residing at All Souls College from October 1642 till March 1645. On the 22nd of February he was made a privy councilor and knighted, and on the 3rd of March appointed chancellor of the exchequer. He was an influential member of the Junto, which met every week to discuss business before it was laid before the council. His aim was to gain over some of the leading Parliamentarians by personal influence and personal considerations, and at the Uxbridge negotiations in January 1645, where he acted as principal manager on the king's side, while remaining firm on the great political questions such as the church and the militia, he tried to win individuals by promises of places and honours. He promoted the assembly of the Oxford parliament in December 1643 as a counterpoise to the influence and status of the Long Parliament. Hyde's policy and measures, however, all failed. They had been weakly and irregularly supported by the king, and were fiercely opposed by the military party, who were jealous of the civil influence, and were urging Charles to trust to force and arms alone and eschew all compromise and concessions. Charles fell now under the influence of persons devoid of all legal and constitutional scruples, sending to Glamorgan in Ireland those strange powers and instructions inexcusable to justice, piety and prudence.

Hyde's influence was much diminished, and on the 4th of March 1647, the day Charles left the king for Bristol as one of the guardians of the prince of Wales and governors of the west, he had the despatches between the council and the army paralysed the proceedings, and lost, according to Hyde, the finest opportunity since the outbreak of the war of raising a strong force and gaining substantial victories in that part of the country. After Hopton's defeat on the 16th of February 1646, at Torrington, Hyde accompanied the king, on the 4th of March, to Scilly, and on the 17th of April, for greater security, to Jersey. He strongly disapproved of the prince's removal to France by the queen's order and of the schemes of assistance from abroad, refused to accompany him, and signed a bond to prevent the sale of Jersey to the French supported by Jermyn. He opposed the projected sacrifice of the church to the Scots and the grant by the king of any but personal or temporary concessions, declaring that peace was only possible "upon the old foundations of government in church and state." He was especially averse to Charles's tampering with the Irish Romanists. "Oh, Mr Secretary," he wrote to Nicholas, "those stratagems have given me more sad hours than all the misfortunes in war which have befallen the king, both to the effects of God's anger towards us." 2 He refused to compound for his own estate. While in Jersey he resided first at St Helier and afterwards at Elizabeth Castle with Sir George Cartet. He composed the first portion of his History and kept in touch with events by means of an enormous correspondence. In 1648 he published A Full answer to an infamous and traitorous Pamphlet, a reply to the resolution of the parliament to present no more addresses to the king and a vindication of Charles.

On the outbreak of the second Civil War Hyde left Jersey (26th of June 1648) to join the queen and prince at Paris. He landed at Dieppe, sailed from that port to Dunkirk, and thence followed the prince to the Thames, where Charles had met the fleet, but was captured and robbed by a privateer, and only joined the prince in September after the latter's return to the Hague. He strongly disapproved of the king's concessions at Newport. When the army broke off the treaty and brought Charles to trial he endeavoured to save his life, and after the execution drew up a letter to the several European sovereigns invoking their assistance to avenge it. Hyde strongly opposed the king's ignominious surrender to the Covenants, the alliance with the Scots, and the Scottish expedition, desiring to accomplish whatever was possible there through Montrose and the royalists, and inclined rather to an attempt in Ireland. His advice was not followed, and he gladly accepted a mission with Cottington to Spain to obtain money from the Roman Catholic powers, and to arrange an alliance between Owen O'Neill and Ormonde for the recovery of Ireland, arriving at Madrid on the 26th of November 1649. The defeat, however, of Charles at Dunbar, and the confirmation of Cromwell's ascendency, influenced the Spanish government.

1 Hist. of the Rebellion, iii. 164, the account being substantially accepted by Gardiner, in spite of inaccuracies in details (Hist. ix. 341, note).

3 Ibid.
against them, and they were ordered to leave in December 1659.

Hyde arrived at Antwerp in January 1651, and in December rejoined Charles at Paris after the latter's escape from Worcester. He now became one of his chief adherents and envoys in his change of residence to Cologne in October 1661 and to Bruges in 1668, and was appointed lord chancellor on the 13th of January 1668.

His influence was henceforth maintained in spite of the intrigues of both Romanists and Presbyterians, as well as the violent and openly displayed hostility of the queen, and was employed unremittingly in the endeavour to keep Charles faithful to the church and constitution, and in the prevention of unwise concessions and promises which might estrange the general body of the royalists. His advice to Charles was to wait upon the turn of events, "that all his activity was to consist in carefully avoiding to do anything that might do him hurt and to expect some blessed conjuncture." In 1656, during the war between England and Spain, Charles received offers of help from the latter power provided he could gain a port in England, but Hyde discouraged small isolated attempts. He expected much from Cromwell's death. The same year he made an alliance with the Levellers, and was informed of their plots to assassinate the protector, without apparently expressing any disapprobation of this. He was also well supported from England, and guided the action of the royalists with great ability and wisdom during the interval between Cromwell's death and the Restoration, urged patience, and advocated the obstruction of a settlement between the factions contending for power and the fomentation of their jealousies, rather than premature risings.

The Restoration was a complete triumph for Hyde's policy. He lays no stress on his own great part in it, but it was owing to him that the Restoration was a national one, by the consent and invitation of parliament representing the whole people and not through the medium of one powerful faction enforcing its will upon a minority, and that it was not only a restoration of Charles but a restoration of the monarchy. By Hyde's advice concessions to the inconvenient demands of special factions had been avoided by referring the decision to a "free parliament," and the declaration of Breda reserved for parliament the settlement of the questions of amnesty, religious toleration, and the proprietorship of forfeited lands.

Hyde entered London with the king, all attempts at effecting his fall having failed, and immediately obtained the chief place in the government, retaining the chancellorship of the exchequer till the 13th of May 1661, when he surrendered it to Lord Ashley. He took his seat as speaker of the House of Lords and in the court of chancery on the 1st of June 1660. On the 3rd of November 1660 he was made Baron Hyde of Hindon, and on the 20th of April 1661 Viscount Cornbury and Earl of Clarendon, receiving a grant from the king of £2,000 and at different times of various small estates and Irish rents. The marriage of his daughter Anne to James, duke of York, celebrated in secret in September 1660, at first alarmed Clarendon on account of the public hostility he expected thereby to incur, but finding his fears unconfirmed he acquiesced in its public recognition in December, and thus became related in a special manner to the royal house and the grandfathers of two English sovereigns.

Clarendon's subsequent position was one of great difficulties, but at the same occasion now offered itself of settling the religious question on a broad principle of comprehension or toleration; for the monarchy had been restored not by the supporters of the church alone but largely by the influence and aid of the nonconformists and also of the Roman Catholics, who were all united at that happy moment by a common loyalty to the throne. Clarendon appears to have approved of comprehension but not of tolerance. He had already in April 1660 sent to discuss terms with the leading Presbyterians in England, and after the Restoration offered bishoprics to several, including Richard Baxter. He drew up the royal declaration of October, promising limited episcopacy and a revised prayer-book and ritual, which was subsequently thrown out by parliament, and he appears to have anticipated some kind of settlement from the Savoy Conference which sat in April 1661. The failure of the latter proved perhaps that the differences were too great for compromise, and widened the breach. The parliament immediately proceeded to pass the series of narrow and tyrannical measures against the dissenters known as the Clarendon Code. The Corporations Act, obliging members of corporations to denounce the Covenant and take the sacrament according to the Anglican usage, became law on the 20th of December 1661, the Act of Uniformity enforcing the use of the prayer-book on ministers, as well as a declaration that it was unlawful to bear arms against the sovereign, on the 10th of May 1662, and these were followed by the Conventicle Act in 1664 suppressing conventicles and by the Five-Mile Act in 1665 forbidding ministers who had refused subscription to the Act of Uniformity to teach or reside in England. Though Clarendon appears to have reluctantly acquiesced in these evil measures rather than to have originated them, and to have endeavoured to mitigate their injustice and severity. He supported the continuance of the tenure by presbyterian ministers of livings not held by Anglicans and an amendment in the Lords allowing a pension to those deprived, earning the gratitude of Baxter and the nonconformists. On the 17th of March 1662 he introduced into parliament a declaration enabling the king to dispense with the Act of Uniformity in the case of ministers of merit. But once committed to the narrow policy of intolerance, Clarendon was inevitably involved in all its consequences. His characteristic respect for the law and constitution rendered him hostile to the general policy of indulgence, which, though the favourite project of the king, he strongly opposed in the Lords, and in the end caused its withdrawal. He declared that he could have wished the law otherwise, "but when it was passed, he thought it absolutely necessary to see obedience paid to it without any connivance." Charles was greatly angered. It was believed in May 1663 that the intrigues of Bennett and Buckingham, who seized the opportunity of ingratiating themselves with the king by zealously supporting the indulgence, had secured Clarendon's dismissal, and in July Bristol ventured to accuse him of high treason in the parliament; but the attack, which did not receive the king's support, failed entirely and only ended in the banishment from court of its promoter. Clarendon's opposition to the court policy in this way acquired a personal character, and he was compelled to identify himself more completely with the intolerant measures of the House of Commons. Though not the originator of the Conventicle Act or of the Five-Mile Act, he has recorded his approval, and he ended by taking alarm at plots and rumours and by regarding the great party of nonconformists, through whose co-operation the monarchy had been restored, as a danger to the state whose "faction was the turbulence."*8

Meanwhile Clarendon's influence and direction had been predominant in nearly all departments of state. He supported the exception of the actual regicides from the Indemnity, but only ten out of the twenty-six condemned were executed, and Clarendon, with the king's support, prevented the passing of a bill in 1661 for the execution of thirteen more. He upheld the Act of Indemnity against all the attempts of the royalists to upset it. The conflicting claims to estates were left to be decided by the law. The confiscations of the usurping government accordingly were cancelled, while the properly executed transactions
between individuals were necessarily upheld. There can be little doubt that the principle followed was the only safe one in the prevailing confusion. Great injustice was indeed suffered by individuals, but the proper remedy of such injustice was the benevolence of the king, which there is too much reason to believe proved inadequate and partial. The settlement of the church lands which was directed by Clarendon presented equal difficulties and involved equal hardships. In settling Scotland Clarendon's aim was to make that kingdom dependent upon England and to uphold the Cromwellian union. He proposed to establish a council at Whitehall to govern Scottish affairs, and showed great zeal in endeavouring to restore episcopacy through the medium of Archbishop Sharp. His influence, however, ended with the ascendency of Lauderdale in 1663. He was, to some extent at least, responsible for the settlement in Ireland, but, while anxious for an establishment upon a solid Protestant basis, urged "temper and moderation and justice" in securing it. He supported Ormonde's wise and enlightened Irish administration, and in particular opposed persistently the prohibition of the import of Irish cattle into England, incurring thereby great unpopularity. He showed great anxiety in the advancement of the colonies, to whom he allowed full freedom of religion. He was responsible also for foreign plantations, and one of the eight lords proprietors of Carolina in 1663; and in 1664 sent a commission to settle disputes in New England. In the department of foreign affairs he had less influence. His policy was limited to the maintenance of peace "necessary for the reducing [the king's] own dominions into that temper of subjection and obedience as they ought to be in." In 1664 he demanded, on behalf of Charles, French support, and a loan of £50,000 against disturbance at home, and thus initiated that ignominious system of pensions and dependence upon France which proved so injurious to English interests later. He was the promoter of the sale of Dunkirk on the 27th of October 1662, the author of which seems to have been the earl of Sandwich, nor of the Dutch War. He attached considerable value to the possession of the former, but when its sale was decided he conducted the negotiations and effected the bargain. He had zealously laboured for peace with Holland, and had concluded a treaty for the settlement of disputes on the 16th of September 1662. Commercial and naval jealousies, however, soon involved the two states in hostilities. Cape Corso and other Dutch possessions on the coast of Africa, and New Amsterdam in America, were seized by squadrons from the royal navy in 1664, and hostilities were declared on the 22nd of February 1665. Clarendon now gave his support to the war, asserted the extreme claims of the English crown over the British seas, and contemplated fresh cessions from the Dutch and an alliance with Sweden and Spain. According to his own account he initiated the policy of the Triple Alliance, but it seems clear that his inclination towards France continued in spite of the intervention of the latter state in favour of Holland; and he took part in the negotiations for ending the war by an undertaking with Louis XIV. implying a neutrality, while the latter seized Flanders. The crisis in this feeble foreign policy and in the general official mismanagement was reached in June 1667, when the Dutch burnt several ships at Chatham and when the roar of foreign guns were heard for the first and last time by the citizens of London.14

The whole responsibility for the national calamity and disgrace, and for the ignominious peace which followed it, was unjustly thrown on the shoulders of Clarendon, though it must be admitted that the disjointed state of the administration and want of control over foreign policy were largely the causes of the disaster, and for these Clarendon's influence and obstruction of official reforms were to some extent answerable. According to Sir William Coventry, whose opinion has weight and who acknowledges the chancellor's fidelity to the king, while Clarendon was so great at the council board and in the administration of matters, there was no room for anybody to propose any remedy to what was remiss . . . he managing all things with that greatness which will now be remembered.15 He disapproved of the system of boards and committees instituted during the Commonwealth, as giving too much power to the parliament, and regarded the administration by the great officers of state, to the exclusion of pure men of business, as the only method compatible with the dignity and security of the monarchy. The lowering of the prestige of the privy council, and its subordination first to the parliament and afterwards to the military faction, he considered as one of the chief causes of the fall of Charles I. He aroused a strong feeling of hostility in the Commons by his opposition to the appropriation of supplies in 1665, and to the audit of the war accounts in 1666, as "an introduction to a commonwealth" and as "a new encroachment," and by his high tone of prerogative and authority, while by his advice to Charles to prorogue parliament he incurred their resentment and gave colour to the accusation that he had advised the king to govern without parliaments. He was unpopular among all classes, among the royalists on account of the Act of Indemnity, among the Presbyterians because of the Act of Uniformity. It was said that he had invented the maxim that "the king should buy and reward his enemies as well as his friends, because they are his already." Every kind of maladministration was currently ascribed to him, of designs to govern by a standing army, and of corruption. He was credited with having married Charles purposely to a barren queen in order to raise his own grandchildren to the throne, with having sold Dunkirk to France, and his magnificent house in St James's was nicknamed "Dunkirk House," while on the day of the Dutch attack on Chatham the mob set up a gibbet at his gate and broke his windows. He had always been exceedingly unpopular at court, and kept severely aloof from the revels and licence which reigned there. Evelyn names "the buffoons and the misses to whom he was an eyesore." He was intensely disliked by the royal mistresses, whose favour he did not condescend to seek, and whose presence and influence were often the subject of his reproaches. A party of younger men of the king's own age, more congenial to his temperament, and eager to drive the old chancellor from power and to succeed him in office, had for some time been endeavouring to undermine his influence by ridicule and intrigue. Surrounded by such general and violent animosity, Clarendon's only hope could be in the support of the king. But the chancellor had early and accurately gauged the nature and extent of the king's attachment to him, which proceeded neither from affection nor gratitude but "from his aversion to be troubled with the intricacies of his affairs," and in 1661 he had resisted the importunities of Ormonde to resign the great seal for the lord treasurership with the rank of "first minister," a title newly translated out of French into English, on account of the obloquy this position would incur and the further dependence which it entailed upon the incompetent king.16 Charles, long weary of the old chancellor's rebukes, was especially incensed at this time owing to his failure in securing Frances Stuart (la Belle Stuart) for his seraglio, a disappointment which he attributed to Clarendon, and was now alarmed by the hostility which his administration had excited. He did not scruple to sacrifice at once the adherent of his house and fortunes. The truth is, Ormonde, "his behaviour and humour was grossly insupportable to myself and all the world else that I could no longer endure it, and it was impossible for me to live with it and do these things with the Parliament that must be done, or the government will be lost."17 By the direction of Charles, James advised Clarendon to resign before the meeting of parliament, but in an interview with the king on the 26th of August Clarendon refused to deliver up the seal unless dismissed, and urged him not to take a step ruinous to the interests both of the chancellor

himself and of the crown. He could not believe his dismissal was really intended, but on the 30th of August he was deprived of the great seal, for which the king received the thanks of the parliament on the 16th of October. On the 12th of November his impeachment, consisting of various charges of bribery, corruption and maladministration, was brought up to the Lords, but the latter refused to order his committal, on the ground that the Commons had only accused him of treason in general without specifying any particular charge. Clarendon wrote humbly to the king asking for pardon, and that the prosecution might be prevented, but Charles had openly taken part against him, and, though desiring his escape, would not order or assist his departure for fear of the Commons. Through the bishop of Hereford, however, on the 20th of November he pressed Clarendon to fly, promising that he should not during his absence suffer in his honour or fortune. Clarendon embarked the same night for Calais, where he arrived on the 2nd of December. The Lords immediately passed an act for his banishment and ordered the petition forwarded by him to parliament to be burnt.

The rest of Clarendon's life was passed in exile. He left Calais for Rouen on the 25th of December, returning on the 21st of January 1668, visiting the baths of Bourbon in April, thence to Avignon in June, residing from July 1668 till June 1671 at Monespens, and to Rouen in May 1674. His sudden banishment entailed great personal hardships. His health at the time of his flight was much impaired, and on arriving at Calais he fell dangerously ill; and Louis XIV, anxious at this time to gain popularity in England, sent him peremptory and repeated orders to quit France. He suffered severely from gout, and during the greater part of his exile could not walk without the aid of two men. At Evreux, on the 23rd of April 1668, he was the victim of a murderous assault by English sailors, who attributed to him the non-payment of their wages, and who were on the point of despatching him when he was rescued by the guard. For some time he was not allowed to see any of his children; even correspondence with them was rendered troublesome by the Act of Banishment; and it was not apparently till 1671, 1673 and 1674 that he received visits from his sons, the younger, Lawrence Hyde, being present with him at his death.

Clarendon bore his troubles with great dignity and fortitude. He found consolation in religious duties and devoted a portion of every day to the composition of his Contemplations on the Psalms, and of his moral essays. Removed effectually from the public scene, and from all share in present politics, he turned his attention once more to the past and finished his History and his Autobiography. Soon after reaching Calais he had written, on the 17th of December 1667, to the university of Oxford, desiring as his last request that the university should believe in his innocence and remember him, though there could be no further mention of him in their public devotions, in their private prayers. In 1668 he wrote to the duke and duchess of York to remonstrate on the report that they had turned Roman Catholic, to the former urging "You cannot be without zeal for the Church to which your blessed father made himself a sacrifice," adding that such a change would bring a great storm against the Romanists. He entertained to the last hopes of obtaining leave to return to England. He asked for permission in June 1671 and in August 1674. In the dedication of his Brief View of Mr Hobbes's Book Leviathan he repeats "the hope which supposes my weak, decayed spirits, and our Majesties will at some time call to your remembrance my long and incorruptible fidelity to your person and your service," but his petitions were not even answered or noticed. He died at Rouen on the 9th of December 1674. He was buried in Westminster Abbey at the foot of the steps at the entrance to Henry VII's chapel. He left two sons, Henry, 2nd earl of Clarendon, and Lawrence, earl of Rochester, his daughter Anne, duchess of York, and a third son, Edward, having predeceased him. His male descendants became extinct on the death of the 4th earl of Clarendon and 2nd earl of Rochester in 1753, the title of Clarendon being revived in 1776 in the person of Thomas Villiers, who had married the granddaughter and heir of the last earl.

As a statesman Clarendon had obvious limitations and failings. He brought to the consideration of political questions an essentially legal but also a narrow mind, conceiving the law, "that great and admirable mystery," and the constitution as fixed, unchangeable and sufficient for all time, in contrast to Fyn, who regarded them as living organisms capable of continual development and evolution; and he was incapable of comprehending and governing the new conditions and forces created by the civil wars. His character, however, and therefore to some extent his career, bear the indelible marks of greatness. He left the popular cause at the moment of its triumph and shewed in so doing a strict consistency. In a court degraded by licence and self-indulgence, he maintained his self-respect and personal dignity regardless of consequences, and in an age of almost universal corruption and self-seeking he preserved a noble integrity and patriotism. At the Restoration he showed great moderation in accepting rewards. He refused a grant of 10,000 acres in the Fens from the king on the ground that it would create an evil precedent, and amused Charles and James by his indignation at the offer of a present of £10,000 from the French minister Fouquet, the only present with which Louis XIV, being in a tide of books painted at the Louvre. His income, however, as lord chancellor was very large, and Clarendon maintained considerable state, considering it due to the dignity of the monarchy that the high officers should carry the external marks of greatness. The house built by him in St James's was one of the most magnificent ever seen in England, and was filled with a collection of portraits, chiefly those of contemporary statesmen and men of letters. It cost Clarendon £50,000, involved him deeply in debt and was considered one of the chief causes of the "gust of envy" that caused his fall. He is described as "a fair, ruddy, fat, middle-aged, handsome man," and his appearance was stately and dignified. He expected deference from his inferiors, and one of the chief charges which he brought against the party of the young politicians was the want of respect with which they treated himself and the lord treasurer. His industry and devotion to public business, of which proofs still remain in the enormous mass of his state papers and correspondence, were exemplary, and were supported by all the calumnies of the neglected, by avidity in business, and frivolity of his successors. As lord chancellor Clarendon made no great impression in the court of chancery. His early legal training had long been interrupted, and his political preoccupations probably rendered necessary the delegation of many of his judicial duties to others. According to Speaker Onslow his decrees were always made with the aid of two judges. Burnet praises him, however, as "a very good chancellor, only a little too soft but very impartial in the administration of justice," and Pepys, who saw him presiding in his court, perceived him to be "a most able and ready man." According to Evelyn, "though no considerable lawyer" he was "one who kept up the fame and substance of things in the nation with . . . solemnity." He made good appointments to the bench and issued some important orders for the reform of abuses in his court. As chancellor of Oxford University, to which office he was elected on the 27th of October 1666, Clarendon promoted the restoration of order and various educational reforms. In 1753 his manuscripts were left to the universally and the greater-grandson Lord Fermor, and in 1789 the money gained by publication was spent in erecting the Clarendon Laboratory, the profits of the History having provided in 1713 a quartering for the university press adjoining the Sheldonian theatre, known since the removal of the press to its present home as the Clarendon Building.

Clarendon had risen to high office largely through his literary and oratorical gifts. His eloquence was greatly admired by
Evelyn and Pepys, though Burnet criticises it as too copious. He was a great lover of books and collected a large library, was well read in the Roman and in the contemporary histories both foreign and English, and could appreciate Carew, Ben Jonson and Cowley. As a writer and historian, he was not without charm, and his style is one of the most delightful in English literature. His great work, the History of the Rebellion, is composed in the grand style. A characteristic feature is the wonderful series of well-known portraits, drawn with great skill and liveliness and especially praised by Evelyn and by Macaulay. The long digressions, the lengthy sentences, and the numerous parentheses do not accord with modern taste and usage, but it may be observed that these often follow more closely the natural involutions of the thought, and express the argument more clearly, than the short disconnected sentences, now generally employed, while in rhythm and dignity Clarendon’s style is immeasurably superior. The composition, however, of the work as a whole is totally wanting in proportion, and the book is overloaded with state papers, misplaced and tedious in the narrative. In considering the accuracy of the history it is important to remember the dates and circumstances of the composition of its various portions. The published History is mainly a compilation of two separate original manuscripts, the first being the history proper, written between 1646 and 1648, with the advantage of a fresh memory and the help of various documents and authorities, and ending in March 1644, and the second being the Life, extending from 1660 to 1668, but composed long afterwards in exile and without the aid of papers between 1668 and 1670. The value of any statement, therefore, in the published History depends chiefly on whether it is taken from the History proper or the Life. In 1671 these two manuscripts were united by Clarendon with certain alterations and modifications making Books i.-vii. of the published History, while Books vii.-xxv. were written subsequently, and, being composed for the most part without materials, are generally inaccurate, with the notable exception of Book ix., made up from two narratives written at Jersey in 1646, and containing very little from the Life. Sincerity and honest conviction are present on every page, and the inaccuracies are due not to willful misrepresentation, but to failure of memory and to the disadvantages under which the author laboured in exile. But they lessen considerably the value of his work, and detract from his reputation as chronicler of contemporary events, for which he was specially fitted by his practical experience in public business, a qualification declared by himself to be the “genius, spirit and soul of an historian.”

In general, Clarendon, like many of his contemporaries, failed to understand the real issues and principles at stake in the great struggle, lacking a knowledge of the personalities and motives of the real men of the day. Even in 1671, when he published in 1672, was published in 1679, the History of the Reign of King Charles II. from the Restoration . . ., published about 1675, being a surreptitious edition of this work, of which the latest and best edition is that of the Clarendon Press of 1857.

Clarendon was also the author of The Difference and Disparity between the Estate and Condition of George, duke of Buckingham and Robert, earl of Essex, a youthfull production vindicating Buckingham, printed in Reliquiae Wottonianae (1672), i. 184; Animadversions on a Book entituled Fanaticism (1673); A Brief View of the Various Views and Errors in Mr. Hobbes’s book entituled Leviathan (1676); The History of the Rebellion and Civil War in Ireland (1719); A Collection of Several Pieces of Edward, earl of Clarendon, containing reprints of speeches from the journals of the House of Lords and of the History of the Rebellion in Ireland (1727); A Collection of Several Tracts containing his Vindication in answer to his impeachment, Reflections upon several Christian Duties, Two Dialogues on Education and on the want of Respect due to age, and Contemplations on the Psalms (1727); Religion and Policy (1811); Essays moral and entertaining on the various faculties and passions of the human mind (1815, and in British Prose Writers, 1819, vol. i.); Speeches in Rushworth’s Collections (1692), pt. iii. vol. i. 230, 333; Declarations and Manifestos (Clarendon being the author of nearly all on the king’s side between March 1642 and March 1645, the first being the answer to the Grand Remonstrance in January 1642, but not of the answer to the XIX. Propositions or the apology for the King’s attack upon Brentford) in the published History, Rushworth’s Collections, E. Husband’s Collections of Ordinances and Declarations (1640), Old Parliamentary History (1751-1762), Somers Tracts, State Tracts, Harleian Miscellany, Thoresby Tracts (Brit. Mus.), E. 157 (14); and a large number of anonymous short contributions to the pamphlet literature of the period, including Transcendent and Multiplied Rebellion (1645); A Letter from a True and Lawful Member of Parliament to one of the Lords of His Highness’s Council (1656), and Two Speeches made in the House of Peers on Monday 10th Dec. (1643) . . . (Somers Tracts, Scott, vi. 576); Second Thoughts (n.d., in favour of a limited toleration) is ascribed to him in the Catalogue in the British Museum; A Letter . . . to one of the Chief Ministers of the Nonconforming Party . . . (Saumur, 7th May 1674) has been attributed to him on insufficient evidence.

Clarendon’s correspondence, amounting to over 100 volumes, is in the Bodleian library at Oxford, and other letters are to be found in Additional MSS. in the British Museum. Selections have been published under the title of State Papers Collected by Edward, earl of Clarendon (Clarendon State Papers) between 1677 and 1786, and the collection has been calendared up to 1657 in 1689, 1872, 1876. Other letters of Clarendon are to be found in Lister’s Life of Clarendon, iii.; Nicholas Papers (Cameran Soc., 1886); Diary of J. Evelyn, appendix; Sir R. Fanshaw’s Original Letters (1724); Warburton’s Life of Prince Rupert (1849); Barwick’s Life of Barkwell (1724); Hist. MSS. Comm. 10th Rep. vi. 420; and in the Harl. Miscellany.

BIBLIOGRAPHY.—Clarendon’s autobiographical works and Letters enumerated above, and the MS. Collection in the Bodleian library. The Lives of Clarendon by T. H. Lister (1838), and by C. H. Firth in Dict. of Nat. Biography (with a contemporary and still unpublished third edition of the Lives of All the Lord Chancellors (1708), in Macdarmid’s Lives of British Statesmen (1807), and in the different Lives by Wood in Athenæ Oxonienses (Bliss), iii. 1918; while those in J. H. Brown’s Lives of the English Poets (1875) are based on Lodge’s portraits, in Lord Campbell’s Lives of the Chancellors, iii. 110 (1845), and in Foss’s Judges, supply no further information. In Historical Inquiries respecting the Character of Edward Hyde, earl of Clarendon, various critical works are still useful, and Lister’s Clarendon (1877) and The History of the Contemporaries of Lord Clarendon (1882), i. preface pt. i. for criticisms of the History see Gardiner’s Chancellors (1877), iii. 121; Barwick’s Life of Barkwell (1724); Earle’s Bibliotheca Britannica (1794); and Lord Clarendon’s Darstellung, by A. Buff (1868); article in the Dict. of Nat. Biography, by C. H. Firth, and especially a series of admirable articles by the same author in the Eng. Hist. Review (1903), iii. 223. (2) CLARENDON, GEORGE WILLIAM FREDERICK VILLIERS, 4TH EARL OF (in the Villiers line) (1800-1870), English diplomat and statesman, was born in London on the 12th of January 1800. He was the eldest son of Hon. George Villiers (1759-1827), youngest son of the 1st earl of Clarendon (second creation), by Theresa, only daughter of the first Lord Boringdon, and granddaughter of the first Lord Grantham. The earldom of the lord chancellor Clarendon became extinct in the Hyde line by the death of the 4th earl, his last male descendant. Jane Hyde, Countess of Essex, the sister of that nobleman (she died in 1724), left two daughters; of these the eldest, Lady Charlotte, became heiress of the Hyde family. She married Thomas Villiers (1709-1780), second son of the 2nd Earl of Jersey, who served with distinction as English minister in Germany, and in 1776 the eldest son of Charlotte of France married her. The connection with the Hyde family was therefore in the female line and somewhat remote. But a portion of the pictures and plate of the great chancellor was preserved to this branch of the family, and remains at The Grove, their family seat at Hertfordshire. The 2nd and 3rd earls were sons of the 1st, and, neither of them having sons, the title passed, on the death of the 3rd earl (John Villiers) in 1838, to their younger brother's son.

Young George Villiers entered upon life in circumstances which gave small promise of the brilliancy of his future career. He was well born; he was heir presumptive to an earldom; and his mother was a woman of great energy, admirable good sense, and high feeling. But the means of his family were contracted; his education was desultory and incomplete; he had not the advantages of a training either at a public school or in the House of Commons. He went up to Cambridge at the early age of sixteen, and entered St. John's College on the 29th of June 1816. In 1820, as the eldest son of an earl's brother with royal descent, he was enabled to take his M.A. degree under the chancellor of the university. The next year he was appointed attaché to the British embassy at St. Petersburg, where he remained three years, and gained that practical knowledge of diplomacy which was of so much use to him in after-life. He had received from nature a singularly handsome person, a polished and engaging address, a ready command of languages, and a remarkable power of composition. Upon his return to England in 1823 he was appointed to a commission of customs, an office which he retained for about ten years. In 1831 he was despatched to France to negotiate a commercial treaty, which, however, led to no result. On the 16th of August 1833 he was appointed minister at the court of Spain. Ferdinand VII. died within a month of his arrival at Madrid, and the infant queen Isabella, then in the third year of her age, was placed by the old Spanish law of female inheritance on her contested throne. Don Carlos, the late king's brother, claimed the crown by virtue of the Salic law of the House of Bourbon which Ferdinand had renounced before the birth of his daughter. Isabella II. and her mother Christina, the queen regent, became the representatives of constitutional monarchy. Don Carlos of Catholic absolutism. The conflict which had divided the despotic and the constitutional powers of Europe since the French Revolution of 1830 broke out into civil war in Spain, and by the Quadruple Treaty, signed on the 22nd of April 1834, France and England pledged themselves to the defence of the constitutional thrones of Spain and Portugal. For six years Villiers continued to give the most active and intelligent support to the Liberal government of Spain. He was accused, though unjustly, of having favoured the revolution of La Granja, which drove Christina, the queen mother, out of the kingdom, and raised Espartero to the regency. He undoubtedly supported the chiefs of the Liberal party, such as Espartero, against the intrigues of the French court; but the object on which his government was to establish the throne of Isabella on a truly national and liberal basis and to avert those complications, dictated by foreign influence, which eventually proved so fatal to that princess. Villiers received the grand cross of the Bath in 1838 in acknowledgment of his services, and succeeded, on the death of his uncle, to the title of earl of Clarendon; in the following year, having left Madrid, he married Katharine, eldest daughter of James Walter, first earl of Verulam.

In January 1840 he entered Lord Melbourne's administration as lord privy seal, and from the death of Lord Holland in the autumn of that year Lord Clarendon also held the office of chancellor of the duchy of Lancaster until the dissolution of the ministry in 1841. Deeply convinced that the maintenance of a cordial understanding with France was the most essential condition of peace and of a liberal policy in Europe, he reluctantly concurred in the measures proposed by Lord Palmerston for the expulsion of the pasha of Egypt from Syria; he strenuously advocated, with Lord Holland, a more conciliatory policy towards France; and he was only restrained from sending in his resignation by the dislike he felt to break up a cabinet he believed to have been formed for peace.

The interval of Sir Robert Peel's great administration (1841-1846) was to the leaders of the Whig party a period of repose; but Lord Clarendon took the warmest interest in the triumph of the principles of free trade and in the repeal of the corn-laws, of which his brother, Charles Pelham Villiers (q.v.), had been one of the earliest champions. For this reason, upon the formation of Lord John Russell's first administration, Lord Clarendon accepted the office of president of the Board of Trade. Twice in his career the governor-generalship of India was offered him, and once the governor-generalship of Canada;—these he refused from reluctance to withdraw from the politics of Europe. But in 1847 a sense of duty compelled him to take a far more laborious and ungenial appointment. The desire of the cabinet was to abolish the lord-lieutenancy of Ireland, and Lord Clarendon was prevailed upon to accept that office, with a view to transform it ere long into an Irish secretariat of state. But he had not been many months in Dublin before he acknowledged that the difficulties then existing in Ireland could only be met by the provision of a new and permanent system of taxation. The crisis was one of extraordinary peril. Agrarian crimes of horrible atrocity had increased threefold. The Catholic clergy were openly disaffected. This was the second year of the Irish famine, and extraordinary measures were required to regulate the bounty of the government and the nation. In 1848 the revolution in France let loose fresh elements of discord, which culminated in an abortive insurrection, and for a lengthened period Ireland was a prey to more than her wonted symptoms of disaffection and disorder. Lord Clarendon remained viceroy of Ireland till 1852, and left behind him permanent marks of improvement. His services were expressly acknowledged in the queen's speech to both Houses of Parliament on the 5th of September 1848—this being the first time that any civil services obtained that honour; and he was made a knight of the Garter (retaining also the grand cross of the Bath by special order) on the 23rd of March 1849.

Upon the formation of the coalition ministry between the Whigs and the Peelites, in 1855, under Lord Aberdeen, Lord Clarendon became for a second time foreign minister. The country was already "drifting," into the Crimean War, as it ever has been since, which was never forgotten. Clarendon was not responsible for the policy which brought war about; but when it occurred he employed every means in his power to stimulate and assist the war departments, and above all he maintained the closest relations with the French. The taunt Nicholas had speculated on the impossibility of the sustained joint action of France and England in council and in the field. It was mainly by Lord Clarendon at Whitehall and by Lord Raglan before Sevastopol
that such a combination was rendered practicable, and did eventually triumph over the enemy. The diplomatic conduct of such an alliance for three years between two great nations jealous of their military honour and fighting for no separate political advantage, tried by successive hardships and at moments on the verge of defeat, was certainly one of the most arduous duties ever performed by a minister. The result was due in the main to the confidence with which Lord Clarendon had inspired the emperor of the French, and to the affection and regard of the empress, whom he had known in Spain from her childhood.

In 1656 Lord Clarendon took his seat at the congress of Paris convoked for the restoration of peace, as first British plenipotentiary. It was the first time since the appearance of Lord Castlereagh at Vienna that a secretary of state for foreign affairs had been present in person at a congress on the continent. Lord Clarendon's first care was to obtain the admission of Italy to the council chamber as a belligerent power, and to raise the barrier which still excluded Prussia as a neutral one. But in the general anxiety of all the powers to terminate the war there was no small danger that the objects for which it had been undertaken would be abandoned or forgotten. It is due entirely to the firmness of Lord Clarendon that the principle of the last moment of his existence, Lord Clarendon continued to devote every faculty of his mind and every instant of his life to the public service; and he expired surrounded by the boxes and papers of his office on the 27th of June 1680. No man owed more to the influence of a generous, unselish and liberal disposition. If he had rivals he never ceased to treat them with the consideration and confidence of friends, and he cared but little for the ordinary prizes of ambition in comparison with the advancement of the cause of peace and progress.

He was succeeded as 5th earl by his eldest son, Edward Hyde Villiers (b. 1684), who became lord chamberlain in 1700.

See also the article (by Henry Reeve) in Fraser's Magazine, August 1876.

CLARENDON, HENRY HYDE, 2ND EARL OF (1638-1700), English statesman, eldest son of the first earl, was born on the 2nd of June 1638. He accompanied his parents into exile and assisted his father as secretary, returning with them in 1660. In 1661 he was returned to parliament for Wiltshire as Lord Cornbury. He became secretary in 1662 and lord chamberlain to the queen in 1665. He took no part in the life of the court, and on the dismissal of his father became a vehement opponent of the administration, defended his father in the impeachment, and subsequently made effective attacks upon Buckingham and Arlington. In 1674 he became earl of Clarendon by his father's death, and in 1679 was made a privy councilor. He was not included in Sir W. Temple's council of that year, but was reappointed in 1680. In 1682 he supported Halifax's proposal of declaring war on France. On the accession of James in 1685 he was appointed lord privy seal, but shortly afterwards, in September, was removed from this office to that of lord-lieutenant of Ireland. Clarendon was embarrassed in his estate, and James required a willing agent to carry out his design by upsetting the Protestant government and the Act of Settlement. Clarendon arrived in Dublin on the 9th of January 1686. He found himself completely in the power of Tyrconnel, the commander-in-chief; and, though, like his father, a staunch Protestant, elected this year high steward of Oxford University, and declining the king's policy, he obeyed his orders to introduce Roman Catholics among his adherents, to present himself on the bench, and clung to office till after the dismissal of his brother, the earl of Rochester, in January 1687, when he was recalled and succeeded by Tyrconnel. He now supported the church in its struggle with James, opposed the Declaration of Indulgence, wrote to Mary an account of the resistance of the bishops, and visited and advised the latter in the Tower. He had no share, however, in inviting William to England. He assured James in September that the Church would be loyal, advised the calling of the parliament, and on the desertion of his son, Lord Cornbury, to William on the 14th of November, expressed to the king and queen the most poignant grief. In the council held on the 27th, however, he made a violent and unseasonable attack upon James's conduct, and on the 1st of December set out to meet William, joined him on the 3rd at Berwick near Salisbury, and was present at the conference at Hungerford on the 8th, and again at Windsor on the 16th. His wish was apparently to effect some compromise, saving the crown for James. According to Burnet, he advised sending James to Breda, and according to the duchess of Marlborough to the Tower, but he himself denies these statements. He opposed vehemently the settlement of the crown upon William and Mary, voted for the regency, and refused to take the oaths of the new sovereigns, remaining a non-juror for the rest of his life. He subsequently retired to the country, engaged in cabals against the government, associated himself with Richard Graham, Lord Preston, and organizing a plot against William, was arrested on the 24th of June 1690 by order of his niece, Queen Mary, and placed in the Tower. Liberated on the 15th of August, he immediately recommenced his intrigues. On Preston's arrest on the 31st of December, a compromising letter from Clarendon was found upon him, and he was named by Preston as one of his accomplices. He was examined before the privy council and again imprisoned in the Tower on the 4th of January 1691, remanded in custody till the 9th of July. This closed his public career. In 1702, on Queen Anne's accession, he presented himself at court, "to talk to his niece," but the queen refused to see him till he had taken the oaths. He died on the 31st of October 1709, and was buried in Westminster Abbey.

His public career had been neither distinguished nor useful, but it seems natural to ascribe its failure to small abilities and to the conflict between personal ties and political convictions which drew him in opposite directions, rather than, following Macaulay, to motives of self-interest. He was a man of some literary taste, a fellow of the Royal Society (1684), the author of The History and Antiquities of the Cathedral Church of Winchester . . . continued by S. Gale (1715), and he collaborated with his brother Rochester in the publication of his father's History (1702-1704). He

CLARENDON, CONSTITUTIONS OF—CLARI

married (1) in 1660, Theodosia, daughter of Lord Capel, and (2) in 1672, Flower, daughter of William Backhouse of Swallowfield in Berkshire, passed away William Bishoppe and of Sir William Backhouse, Bart. He was succeeded by his only son, Edward (1661–1724), as 3rd earl of Clarendon; and, the latter having no surviving son, the title passed to Henry, 2nd earl of Rochester (1672–1753), at whose death without male heirs it became extinct in the Hyde line.

CLARENDON, CONSTITUTIONS OF, a body of English laws issued at Clarendon in 1164, by which Henry II. endeavored to settle the relations between Church and State. Though they purported to declare the usages on the subject which prevailed in the reign of Henry I. they were never accepted by the clergy, and were formally renounced by the king at Avranches in September 1172. Some of them, however, were in part at least, as they all purported to be, declaratory of ancient usage and remained in force after the royal renunciation. Of the sixteen provisions the one which provoked the greatest opposition was that which declared in effect that criminal clerks were to be summoned to the king's court, and from there, after formal accusation and defence, sent to the proper ecclesiastical court for trial. If found guilty they were to be degraded and sent back to the king's court for punishment. This measure in effect gave the king's courts a permanent place in English law, declared that all suits even between clerk and clerk concerning advowsons and presentations should be tried in the king's court. By other provisions appeals to Rome without the licence of the king were forbidden. None of the clergy were to leave the realm, nor were the king's tenants-in-chief and ministers to be excommunicated or their lands interdicted without the royal permission. Pleas of debt, whether involving a question of good faith or not, were to be in the jurisdiction of the king's courts. Two most interesting provisions, to which the clergy offered no opposition, were: (1) if a dispute arose between a clerk and a layman concerning a tenement which the clerk claimed as free-als (frankalmoign) and the layman as a lay-fee, it should be determined by the recognition of twelve lawful men before the king's justice whether it belonged to free-als or lay-fee, and if it were found to belong to free-als then the plea was to be held in the ecclesiastical court, but if to lay-fee, in the court of the king or of one of his magnates; (2) a declaration of the procedure for election to highchurches and royal abbeys, generally considered to state the terms of the settlement made between Henry I. and Anselm in 1107.

CLARES, POOR, otherwise Clarisses, Franciscan nuns, so called from their foundress, St Clara (q.v.). She was professed by St Francis in the Portiuncula in 1212, and two years later she and her first companions were established in the convent of St Damian's at Assisi. The nuns formed the "Second Order of St Francis," the friars being the "First Order," and the Tertiaries (q.v.) the "Third." Before Clara's death in 1253, the Second Order spread over Italy and into Spain, France and Germany; in England they were founded c. 1293, and established in London, outside Aldgate, where their name of Minories survives in the Minories; there were only two other English houses before the Dissolution. St Francis gave the nuns no rule, but only a "Form of Life" and a "Last Will," each only five lines long, and coming to no more than an incultation of his idea of evangelical poverty. Something more than this became necessary as soon as the institute began to spread; and during Francis's absence in the East, 1219, his supporter Cardinal Hugolino composed a rule which made the Franciscan nuns practically a species of unduly strict Benedictines, St Francis's special characteristics being eliminated. St Clara made it her life work to have this rule altered, and to get the Franciscan character of the Second Order restored; in 1247 a "Second Rule" was approved which went a long way towards satisfying her desires, and finally in 1253 a "Third," which practically gave what she wanted. This rule has come to be known as the "Rule of the Clares"; it is one of great poverty, asceticism and austerity of life. Most of the convents adopted it, but several clung to that of 1247. To bring about conformity, St Bonaventura, while general (1264), obtained papal permission to modify the rule of 1253, somewhat mitigating its austerities and allowing the convents to have fixed incomes,—thus assimilating them to the Convvent Franciscans as opposed to the Spirituals. This rule was adopted in many convents, but many more adhered to the strict rule of 1253. Indeed a counter-tendency towards a greater strictness set in, and a number of reforms were initiated, introducing an appalling austerity of life. The most important of these reforms were the Coletines (St Colette, c. 1400) and the Capucines (c. 1540; see CAPUCHINS). The half-dozen forms of the Franciscan rule for women here mentioned are still in use in different convents, and there are also a great number of religious institutes for women based on the rule of the Tertiaries. By the term "Poor Clares" the Coletine nuns are now commonly understood; there are various convents of these nuns, as of other Franciscans, in England and Ireland. Franciscan nuns have always been very numerous; there are now about 150 convents of them in France, Germany, Italy, Spain, and England, in every part of the world, besides innumerable institutions of Tertiaries.

See Helyot, Hist. des ordres religieux (1792), vii. cc. 25–28 and 38–42; Weitzer and Welte, Kirchenlexikon (2nd ed.), art. "Clam"; Max Heimbucher, Orden und Kongregatiomen (1896), i. §§ 47, 48, who gives references to all the literature. For a scientific study of the beginnings see Lempf, "Die Anfänge des Klarissenorden" in Zeitschrift für Kirchengeschichte, xiii. (1892), 181 ff. (E. C. B.)

CLARET, JULES ARSENE ARNAUD (1840– ), French man of letters and director of the Théâtre Français, was born at Limoges on the 3rd of December 1840. After studying at the lycée Bonaparte in Paris, he became an active journalist, achieving great success as dramatic critic to the Figaro and to the Moniteur national. He was correspondent during the Franco-German War, and during the Commune was a staff-officer in the National Guard. In 1885 he became director of the Théâtre Français, and from that time devoted his time chiefly to its administration. He was elected a member of the Academy in 1888, and took his seat in February 1889, being received by Ernest Renan. The long list of his works includes Histoire de la révolution de 1870–1871 (new ed., 5 vols., 1875–1876); Cinqu ans après; l'Alsace et la Lorraine depuis l'annexion (1876); some annual volumes of reprints of his articles in the weekly press, entitled La Vie à Paris; La Vie moderne au théâtre (1885–1896); Molière, sa vie et son œuvre (1871); Histoire de la littérature française, 900–1900 (2nd ed. 1903); Candidat (1887), a novel of contemporary life; Brichanteau, comédien français (1869); several plays, some of which are based on novels of his own—Les Muscadins (1874), Le Régiment de Champagne (1877), Les Mirabeau (1879), Monsieur le ministre (1883), and others; and the opera, La Naissance, based on his novel La Cigarette, and written with Henri Celn, to the music of Massenet. La Naissance was first produced at Convent Garden (June 1894) with Mme Calvé in the part of Anita. His Clares complites were published in 1897–

1904.

CLARI, GIOVANNI CARLO MARIA, Italian musical composer, chapel-master at Pistoia, was born at Pisa about the year 1660. The time of his death is unknown. He was the most celebrated pupil of Colonnà, chapel-master of S. Petronio, at Bologna. He became maestro di cappella at Pistoia about 1712, at Bologna in 1720, and at Pisa in 1736. He is supposed to have died about 1745. The works by which Clari distinguished himself pre-eminently are his vocal duets and trios, with a basso continuo, published between 1740 and 1747. These compositions,
which combine graceful melody with contrapuntal learning, were much admired by Cherubini. They appear to have been admired by Handel also, since he did not hesitate to make appropriations from them. Clari composed one opera, *Il Siatto delirante*, produced at Bologna in 1695, and a large quantity of church music, several specimens of which were printed in Novello's *Pittウィlliam Music*.

**CLARINA**, a comparatively new instrument of the wood-wind class (although actually made of metal), a hybrid possessing characteristics of both oboe and clarinet. The clarina was invented by W. Heckel of Biebrich-am-Rhein, and has been used since 1891 at the Festspielhaus, Bayreuth, in *Tristan und Isolde*, as a substitute for the Holotrompete made according to Wagner's instructions. The clarina has been found more practical and more effective in producing the desired tone-colour. The clarina is a metal instrument with the conical bore and fingering of the oboe and the clarinet single-reed mouthpiece. The compass of the clarina is as shown, and it stands in the key of B♭. Like the clarinet, the clarina is a transposing instrument, for which the music must be written in a key a tone higher than that of the composition. The timbre resulting from the combination of conical bore and single-reed mouthpiece has in the lowest register affinities with the *cor anglais*, in the middle with the saxophone, and in the highest with the clarinet. Other German orchestras have followed the example of Bayreuth. The clarina has also been found very effective as a solo instrument.

(K.S.)

**CLARINET**, or **CLARINET (Fr. clarinette; Ger. Clarinette, Klarinet; Ital. clarineto, chiarinotto)**, a wood-wind instrument having a cylindrical bore and played by means of a single-reed mouthpiece. The word "clarinet" is said to be derived from *clarinetto*, a diminutive of *clarino*, the Italian for (1) the soprano trumpet, (2) the highest register of the instrument, (3) the trumpet played musically without the blare of the martial instrument. The word "clarinet" is similarly derived from "clarion," the English equivalent of *clarino*. It is suggested that the name *clarinet* or *clarinetta* was bestowed on account of the resemblance in timbre between the high registers of the clarino and clarinet. By adding the speaker-hole to the old chalumeau, J. C. Denner gave it an additional compass based on the overblowing of the harmonic twelfth, and consisting of an octave and a half of harmonics, which received the name of *clarina*, while the lower register retained the name of *chalumeau*. There is something to be said also in favour of another suggested derivation from the Italian *chiarina*, the name for reed instruments and the equivalent for *tibia* and *aulos*. At the beginning of the 18th century in Italy *clarinette*, the diminutive of *clarino*, was masculine, whereas *chiarinetta* or *clarinetta* would be feminine,1 as in Doppelmayr's account of the invention written in 1735. The word "clarinet" is sometimes used in a generic sense to denote the whole family which consists of the clarinet, or descant corresponding to the violin, oboe, &c.; the alto clarinet in E; the basset horn in F (q.v.); the bass clarinet (q.v.), and the pedal clarinet (q.v.).

The modern clarinet consists of five (or four) separate pieces: (1) the mouthpiece; (2) the bulb; (3) the upper middle joint, or left-hand joint; (4) the lower middle joint, or right-hand joint; (5) the bell; which (the bell excepted) when joined together, form a tube with a continuous cylindrical bore, 2 ft. or more in length, according to the pitch of the instrument. The mouthpiece, including the beating or single-reed common to the whole clarinet family, has the appearance of a beak with the point bevelled off and thinned at the edge to correspond with the end of

1 See Gottfried Weber's objection to this derivation in "Über Clarinetten und Bassett-horn," *Caecilia* (Mainz, 1829), vol. xi. pp. 36 and 37, note.

2 Nos. 3 and 4 are sometimes made in one, as for instance in Messrs Rudall, Carte & Company's modification, the Khussmann patent.
CLARINET

harmonics, a principle well understood by the ancient Greeks and Romans in playing upon the aulos and tibia. This is easier to accomplish with the double reed than with the beating reed. It is possible to produce a tube of wide diameter, such as that of the modern clarinet, it would not be possible by this means alone to do justice to the tone of the instrument or to the music now written for it. The bore of the aulos was very much narrower than that of the clarinet.

In order to facilitate the production of the harmonic notes on the clarinet, a small hole, closed by means of a key and called the “speaker,” is bored near the mouthpiece. By means of this small hole the air-column is placed in communication with the external atmosphere, a ventral segment is formed, and the air-column divides into three equal parts, producing a triple number of vibrations resulting in the third note of the harmonic series, at an interval of a twelfth above the fundamental. In a wind instrument with lateral holes the fundamental note corresponding to any particular hole is produced when all the holes below that hole are open and it itself and all above it are closed, the effective length of the resonating tube being shortened as each of the closed holes is successively uncovered. In order to obtain a complete chromatic scale on the clarinet at least eighteen holes are required. The two methods of fingerings, with the bell-note of the Pythagorean nineteenth semitones, giving the range of a twelfth and known as the fundamental scale or chalumeau register, so-called, because it was the compass (without chromatic semitones) of the more primitive predecessor of the clarinet, known as the chalumeau, which must not be confounded with the shawm or shalmey of the middle ages.

The fundamental scale of the modern clarinet in C extends from

\[ C \quad F \quad B \]

The next octave and a half is obtained by opening the compass to

\[ C \quad F \quad B \]

There is good reason to think that the ancient Greeks understood the advantage of a speaker-hole, which they called syrinx, for facilitating the production of harmonics on the aulos. The credit of the discovery of this interesting fact is due to A. A. Howard, of Harvard University, who explains the explanations of the ancient writers which were before obscure (see Aulos). Plutarch relates that Telephaneas of Megara was so incensed with the syrinx that he never allowed his instrument-makers to place one on any of his aulos, he even went so far as to blame them in writing on his own syrinx, from the Pythian games. Telephaneas was a great virtuoso who scorned the use of a speaker-hole, being able to obtain his harmonics on the aulos by mere control of lips and teeth. The modern clarinet has from thirty to forty keys, the key between being normally closed. In order to understand why, when once the idea of adding keys to the chalumeau had been conceived, the number rose so slowly, keys being added one or two at a time by makers of various nationalities at long intervals, it is necessary to consider the effect of boring holes in the side of a cylindrical tube. If it were possible to proceed from an absolute theoretical basis, there would be but little difficulty; there are, however, practical reasons which make this a matter of great difficulty. By Euler's formula, V = (4π/3)R^3, a cylinder of which the diameter is 2, yields a volume of 4.19 cm^3, while a cylindrical bore of 1.4 cm. in length would yield a bore with a cross-section of 0.39 cm^2. Hence, while the internal diameter of the bore measures exactly 1.4 cm. Any increase in the diameter of the cylindrical bore for a given length of tube, the farther from the key, the greater is the decrease in bore, for each. A bore narrow in proportion to the length facilitates the production of the harmonics, which is no doubt the reason why the aulos was made with a very narrow diameter, and produced such deep notes. The speaker-hole is necessarily supplied, in determining the position of the holes along the tube, the thickness of the wood to be pierced must be taken into consideration, for the length of the passage from the main bore to the outer air adds to the length of the resonating column; as, however, the clarinet tube is reeded as a closed one, only the external length must be taken into account. In its correct theoretical position, a hole should have its diameter equal to the diameter of the main bore, which is the ideal condition for obtaining a full, rich tone; it is, however, feasible to give the speaker-hole a diameter, altering its position by placing it nearer the mouthpiece. These laws, which were likewise known to the Greeks and Romans, had to be rediscovered by experience in the 18th and 19th centuries, during which the mechanism of the key system was repeatedly improved. Due consideration having been given to these points, it will also be necessary to remember that the stopping of the seven open holes leaves only the two little fingers (the thumb of the right hand being in the ordinary clarinet engaged in the key-work) having the full control of the harmonics. When the middle finger is stopped, the other fingers doing duty when momentarily disengaged. The fingering of the clarinet is the most difficult of any instrument in the orchestra, for it differs in all four octaves of its compass. Once entered, however, it is the same for all clarinets, the music being always written in the key of C.

The actual tonality of the clarinet is determined by the diatonic scale produced when, with keys untouched and finger and thumb-holes closed, the fingers are raised one by one from the holes. In the Bb clarinet, the real sounds thus produced are

\[ C \quad F \quad B \]

being part of the scale of Bb major. By the closing of two open keys, the lower Eb and D are added. The following are the various sizes of clarinets with the key proper to each:

- Eb, a minor third above the C clarinet.
- Bb, a tone below
- D, a tone above
- F, a tone below
- G, a fourth below
- A, a minor third below
- B, a semitone below
- C, a major tone below
- Eflat, a fifth below the Bb clarinet.
- Ab, a tone below
- Eb, a minor third below
- Eb, a major tone below
- Bb, an octave below
- F, a tone below

The pedal clarinet in Bb, an 8va below that in Bb.

History.—Although the single beating-reed associated with the instruments of the clarinet family has been traced in ancient Egypt, the double reed, characteristic of the oboe family, being of simpler construction, was probably of still greater antiquity. An ancient Egyptian pipe found in a mummy-case and now preserved in the museum at Turin was found to contain a beating-reed sunk 3 in. below the end of the pipe, which is the principle of the drone. It would appear that the double chalumeau, called argouli (γαρουλίν) by the modern Egyptians, was known in ancient Egypt, although it was not perhaps in common use. The Musée Guimet possesses a copy of a fresco from the tombs at Saqqarah (executed under the direction of Mariette Bey) ascribed to the 4th or 5th dynasty, on which is shown a concert with dancing; the instruments used are two harps, the long oblique flute "ny," blown from the end without any mouthpiece or embouchure, and an instrument identified as an argouli. 1

2 See Macrobius, Comment in somnium Scipionis, i. 4. 5: "nego secus probamus in tibiis de quarto foraminibus vicinis infantes oris sonus acutus emittitur, de longinquis autem et termino proximis, gravior: item acutior per patellaria foramina, gravior per angua." 3

3 See Victor Loret, L'Egypte au temps des Pharaons—la vie, le science, et l'art (Paris, 1889), illustration p. 139 and p. 143. The author gives no information about this fresco except that it is in the
from its resemblance to the modern instrument of the same
name. This is believed to be the only illustration of the ancient
double chalumeau yet found in Egypt, with the single exception
of a hieroglyph occurring also once only, i.e. the sign read As-ñ,
consisting of a cylindrical pipe with a beak mouthpiece bound
round with a cord tied in a bow. The bow is taken to indicate
the double parallel pipes bound together; the same sign without
the bow occurs frequently and is read Ma-ñ, and is considered
to be the generic name for reed wind instruments. The beating-
reed was probably introduced into classic Greece from Egypt or
Asia Minor. A few ancient Greek instruments are extant, five
of which are in the British Museum. They are as nearly cylindri-
cal as would be the natural growing reed itself. The probability
is that both single and double reeds were at times used with the
Greek aulos and the Roman tibia. V. Mahillon and A. A.
Howard of Harvard have both obtained facsimiles of actual
instruments, some found at Pompeii and now deposited in the
museum at Naples, and others in the British Museum. Experiments
made with those instruments, whose original mouthpieces have
perished, show that with pipes of such narrow diameter the
fundamental scale and pitch are the same whether sounded by
means of a single or of a double reed, but the modern combina-
tion of single reed and cylindrical tube alone gives the full
pure tone quality. The subject is more fully discussed in the
article AULOS.2 The Roman tibia, if monuments can be trusted,
sometimes had a beak-shaped mouthpiece, as for instance that
attached to a pipe discovered at Pompeii, or that shown in a
scene on Trajan's column.3 It is probable that when, at the
decline of the Roman empire, instrumental music was placed
by the church under a ban—and the tibia more especially from
its association with every form of licence and moral depravity—
this instrument, sharing the common fate, survived chiefly among
itinerant musicians who carried it into western Europe, where it
was preserved from complete extinction. An instrument of
different technique requiring an advanced knowledge of
acoustics was not, however, likely to flourish or even to be
understood among nations whose culture was as yet in its
infancy.

The tide of culture from the Byzantine empire filtered through
to the south and west, leaving many traces; a fresh impetus
was received from the east through the Arabs; and later, as a
result of the Crusades, the prototype of the clarinet, together
with the practical knowledge necessary for making the instru-
ment and playing upon it, may have been re-introduced through
any one or all of these sources. However this may be, the
instrument was during the Carolingian period identified with
the tibia of the Romans until such time as the new western
civilization ceased to be content to go back to classical Rome
for its models, and began to express itself, at first naively and
awkwardly, as the 11th century dawned. The name then
changed to the derivatives of the Greek kalamos, assuming an
almost bewildering variety of forms, of which the commonest
are chalame, chalumeau, schalmei, shawm, calemel, kalamele.4
The derivation of the name seems to point to a Byzantine
rather than an Arab source for the revival of the instruments
which formed the prototype of both oboe and clarinet, but it must not be forgotten that the instruments with a
conical bore—more especially those played by a reed—are
primarily of Asiatic origin. At the beginning of the 13th
century Musée Guimet. It is probably identical with the second of the
mural paintings described on p. 190 of Petit guide illustré au Musée
Guimet, par L. de la Motte (Paris, 1886).

"—J. A. Scheler's Trouvères belges.

in France, where the instrument remained a special favourite
until it was displaced by the clarinet, the chalumeau is mentioned
in some of the early romances—"Taler de chalmeaux et
estromens sonner" (Aye d'Avignon, v. 4137); "Grelles et chalmeius et bussianes bruiains" (Guis de Bourgogne, v. 1374),
&c. By the end of the 13th century, the German equivalent
Schalmei appears in the literature of that country—"Puschen
und Schalmeyen schal mocht niemen da gehoren wals" (Frauen-
dienst, 492, fol. 5, Ulrich von Liechtenstein). The schalmei
or shawm is frequently represented in miniatures from the 13th
century, but it must have been known long before, since it was
at that period in use as the chaurier of the bag-pipe (q.v.),
a fully-developed complex instrument which presupposes a
separate previous existence for its component parts.

We have no reason to suppose that any distinction was drawn
between the single and double reed instruments during the
early middle ages—if indeed the single reed was then known at
all—for the derivatives of kalamos were applied to a variety of
pipes. The first clear and unmistakable drawing yet found of
the single reed occurs in Mersenne's Harmonie universelle (p. 282),
where the primitive reed pipe is shown with the beating-reed
detached from the tube of the instrument itself, by making a
lateral slit and then splitting back a little tongue of reed towards
a knot. Mersenne calls this the simplest form of chalumeau or
weatstalk (lyuau de bflé). It is evident that no significance
was then attached to the form of the vibrating reed, whether
single or double, for Mersenne and other writers of his time
call the chauriers of the musette and cornemuse chalumeaux
whether they are of cylindrical or of conical bore. The difference
in timbre produced by the two kinds of reeds was, however,
derstood, for Mersenne states that a special kind of cornemuse
was used in concert with the hautbois de Poitou (an oboe whose
double reed was enclosed in an air chamber) and was distinguished
from the shepherd's cornemuse by having double reeds through-
out, whereas the cornemuses of Desouch (Nuremberg) were furnished
with beating reeds. It is therefore evident that as late as 1636
(the date at which Mersenne wrote) in France the word "chal-
umeau" was not applied to the instrument transformed some
sixty years later into the clarinet, nor was it applied exclusively
to any one kind of pipe except when acting as the chaurier of
the bagpipe, and that independently of any structural
characteristics. The chaurier was still called chalumeau in 1737.5
Of the instrument which has been looked upon as the chalumeau,
there is but little trace in Germany or in France at the beginning
of the 17th century. A chalumeau with beak mouthpiece and
characteristic short cylindrical tube pierced with six holes
figures among the musical instruments used for the triumphal
procession of the emperor Maximilian I., commemorated by a
fine series of plates,6 engraved on wood by Hans Burgkmair,
the friend and colleague of A. Dürrer. On the same plate (No.
79) are five schalmes with double reeds and five chalumeaux
with single-reed beak mouthpieces; the latter instruments were
in all probability made in the Netherlands, which excelled from
the 12th century in the manufacture of all musical instruments.
No single-reed instrument, with the exception of the regal (q.v.),
is figured by S. Virdung,7 M. Agricola8 or P. Praetorius.9
A good idea of the primitive chalumeau may be gained from
a reproduction of one of the few specimens from the 16th or 17th
century still extant, which belonged to Césare Snochek
and was exhibited at the Royal Military Exhibition in London in 1890.10
The tube is stopped at the mouthpiece end by a natural joint of

the reed, and a tongue has been detached just under the joint; there are six finger-holes and one for the thumb. An instrument almost identical in number, shape, but with a rudimentary bell, and showing plainly the detached tongue, is figured by Jost Amman in 1589.1 A plate in Diderot and d’Alembert’s Encyclopédie2 shows a less primitive instrument, outwardly cylindrical and having a separate mouthpiece joint and a clarinet reed but no keys. A chalumeau without keys, but consisting apparently of three joints—mouthpiece, main tube and bell,—is figured on the title-page of a musical work3 dated 1690; it is very similar to the one represented in fig. 3, except that only six holes are visible.

In his biographical notice of J. Christian Denner (1655–1707), J. G. Doppelmayr4 states that at the beginning of the 18th century “Denner invented a new kind of pipe, the so-called clarinet, which greatly delighted lovers of music; he also made great improvements in the stock of rackett-fagottos, known in the old time and finally also in the chalumeaux.” It is probable that above in the chalumeau to which Doppelmayr alludes without understanding them consisted (a) in giving the mouthpiece the shape of a beak and adding a separate reed tongue as in that of the modern clarinet, unless this change had already taken place in the Netherlands, the country which the unremittig labours of E. van der Straeten5 have revealed as taking the lead in Europe from the 14th to the 16th century in the construction of musical instruments of all kinds; (b) in the boring of two additional holes for A and B near the mouthpiece and covering them with two keys; (c) in replacing the long cylindrical mouthpiece joint by a bulb, thus restoring one of the characteristic features of the tibia,6 known as the Skap. There are a few of these improved chalumeaux in existence, two being in the Bavarian national museum at Munich, the one in high A, in a bad state of preservation,7 the second in C, marked J. C. Denner, of which M. Mahillon8 has made a facsimile9 for the museum of the Brussels Conservatoire. There are two keys and eight holes; the first consists of two small holes on the same level giving a semitone if only one be closed. If the thumb-key be left open, the sounds of the fundamental scale (shown in the black notes below) rise a twelfth to form the second register (the white notes)

This early clarinet or improved chalumeau has a clarinet mouthpiece, but no bulb; it measures 50 cm. (20 in.), whereas the one in A mentioned above is only 28 cm. in length, the long cylindrical tube between mouthpiece and key-joint, afterwards turned into the bulb, being absent. Mahillon was probably the first to point out that the so-called invention of the clarinet by J. C. Denner consisted in providing a device—the speaker-key—to facilitate the production of the harmonics of the fundamental. Can we be sure that the same result was not obtained on the old chalumeau

before keys were added, by partially uncovering the hole for the thumb?

The Berlin museum possesses an early clarinet with two keys, marked J. B. Oberlender, derived from the Snoeck collection. Paul de Wit’s collection has a similar specimen by Enkelmer. The Brussels Conservatoire possesses clarinets with two keys by Flemish makers, G. A. Rottenburgh and J. B. Willems; the latter, with a small bulb and bell, is in G a fifth above the C clarinet. The next improvements in the clarinet, made in 1720, are due to J. Denner, probably a son of J. C. Denner. They consisted in the addition of a bell and in the removal of the speaker-hole and key nearer the mouthpiece, involving the reduction of the diameter of the hole. The effect of this change of position was to turn the B♭ into B, for J. Denner introduced into the hole, nearly as far as the axis of the bore, a small metal drainage tube10 for the moisture of the breath. In the modern clarinet, the same result is attained by raising this little tube slightly above the surface of the main tube, placing a key on the top of it, and bending the lever. In order to produce the missing B♭, J. Denner lengthened the tube and pierced another hole, the low E, covered by an open key with a long lever which, when closed, gives the desired B as its twelfth, thus forming a connexion between the two registers. A clarinet with three keys, of similar construction (about 1750), marked J. W. Kenigsberger, is preserved in the Bavarian national museum, at Munich. Another in B♭ marked Lindner11 belongs to the collection at Brussels. About the middle of the 18th century, the number of keys was raised to five, some say12 by Barthold Fritz von Brunswick (1697–1766), who added keys for C♯ and D♯.

According to Altenburg13 the E♭ or D♯ key is due to the virtuoso Joseph Beer (1744–1811). The sixth key was added about 1790 by the celebrated French virtuoso Xavier Lelefure (or Lefèvre), and produced C♯, E♭, C, G. Anton Stadler and his brother, both clarinettists in the Vienna court orchestra and instrument-makers, are said to have lengthened the tube of the B♭ clarinet, extending the compass down to the real sound B♭. It was for the Stadler brothers that Mozart wrote his quartet for strings, with a fine obbligato for the clarinet in A (1789), and the clarinet concerto with orchestra in 1791.

This, then, was the state of the clarinet in 1810 when Ivan Müller, then living in Paris, carried the number of keys up to thirteen, and made several structural improvements already mentioned, which gave us the modern instrument and inaugurated a new era in the construction and technique of the clarinet. Müller’s system is still adopted in principle by most clarinet makers. The instrument was successively improved during the 19th century by the Belgian makers Bachmann, the elder Sax, Albert and C. Mahillon, whose invention in 1862 of the C key with double action is now generally adopted. In Paris the labours of Lelefure, Buffet-Crampon, and Goumes are pre-eminent. In 1842 H. E. Klosè conceived the idea of adapting to the clarinet the ingenious mechanism of movable rings, invented by Boehm for the flute, and he entrusted the execution of this innovation to Buffet-Crampon; this is the type of clarinet generally adopted in French orchestras. From this adaptation has sprung the erroneous notion that Klosè’s clarinet was constructed according to the Boehm system; Klosè’s lateral divisions of the tube do not follow those applied by Boehm to the flute.

In England the clarinet has also passed through several progressive stages since its introduction about 1770, and first of

11 H. Welcker von Gontenshausen, Die musikalischen Tonwerk- scbe (Frankfort-on-Main, 1855), p. 141.
all at the hands of Corneliuss Ward. The principal improvements were due to Richard Carte, who took out a patent in 1838 for an improved Boehm clarinet which possessed some claim to the name, since Boehm’s principle of boring the holes at theoretically correct intervals and of venting the holes by means of open holes below was carried out. Carte made several modifications of his original patent, his chief endeavour being to so dispose the key-work as to reduce the difficulties in fingering. By the extension of the principle of the ring action, the work of the third and little fingers of the left hand was simplified and the fingering of certain difficult notes and shakes greatly facilitated. Messrs Rudall, Carte & Company have made further improvements in the clarinet, which are embodied in Klussmann’s patent (fig. 4); these consist in the introduction of the duplicate G# key, a note which has hitherto formed a serious obstacle to perfect execution. The duplicate key, operated by the third or second finger of the right hand, releases the fourth finger of the left hand. The old G# is still retained and may be used in the usual way if desired. The body of the instrument is now made in one joint, and the position of the G# key is mathematically correct, whereby perfect intonation for C#, G# and F# is secured. Other improvements were made in Paris by Messrs Evette & Schaeffer and by M. Paradis, a clarinet-player in the band of the Garde Républicaine, and very great improvements in boring and in key mechanism were effected by Albert of Brussels (see fig. 1).

The clarinet appears to have received appreciation in the Netherlands earlier than in its own native land. According to W. Altenburg (op. cit. p. 11) a MS. is preserved in the cathedral at Antwerp of a clarinet in a mass written by A. J. Faber in 1720, which is scored for a clarinet. Johann Matthesen, Kapellmeister at Hamburg, mentions clarinet music in 1713, although Handel, whose rival he was, does not appear to have known the instrument. Joh. Christ. Bach scored for the clarinet in 1763 in his opera Orione performed in London, and Rameau had already employed the instrument in 1751 in a theatre for his pastoral entitled Acante et Céphise. The clarinet was formally introduced into the orchestra in Vienna in 1767; Gluck having contented himself with the use of the chalumeau in Orfeo (1762) and in Alceste (1767). The clarinet had already been adopted in military bands in France in 1755, where it very speedily completely replaced the oboe. One of Napoleon Bonaparte’s bands is said to have had no less than twenty clarinets.

For further information on the clarinet at the beginning of the 19th century, consult the Methods by Ivan Müller and Xavier Lefebvre, and Joseph Froebich’s admirable work on the instruments of the orchestra; and Gottfried Weber’s articles in Erich and Graber’s Encyclopaedia. See also Basset Horn; Bass Clarinet and Pedal Clarinet.

CLARK, SIR A.—CLARK, F. E.

Fig. 4. — Clarinet (Boehmmodel, Klussmann’s patent).

CLARK, SIR ANDREW, Bart. (1826—1833). British physician, was born at Aberdeen on the 28th of October 1826. His father, who also was a medical man, died when he was only a few years old. After attending school in Aberdeen, he was sent by his guardians to Dundee and apprenticed to a druggist; then returning to Aberdeen he began his medical studies in the university of that city. Soon, however, he went to Edinburgh, where in the extra-academic school he had a student’s career of the most brilliant description, ultimately becoming assistant to J. Hughes Bennett in the pathological department of the Royal Infirmary, and assistant demonstrator of anatomy to Robert Knox. But symptoms of pulmonary phthisis brought his academic life to a close, and in the hope that the sea might benefit his health he joined the medical department of the navy in 1848. Next year he became pathologist to the Haslar hospital, where T. H. Huxley was one of his colleagues, and in 1853 he was the successful candidate for the newly-instituted post of curator to the museum of the London hospital. Here he intended to devote all his energies to pathology, but circumstances brought him into active medical practice. In 1854, the year in which he took his doctor’s degree at Aberdeen, the post of assistant-physician to the hospital became vacant and he was prevailed upon to apply for it. He was fond of telling how his phthisical tendencies forced him to accept the appointment. "He is only a poor Scotch doctor," it was said, "with but a few months to live; let him have it.” He had it, and two years before his death publicly declared that of those who were on the staff of the hospital at the time of his selection he was the only one remaining alive. In 1854 he became a member of the College of Physicians, and in 1858 a fellow, and then went in succession through all the offices of honour the college has to offer, ending in 1888 with the presidency, which he continued to hold till his death. From the time of his selection as assistant physician to the London hospital, his fame rapidly grew until he became a fashionable doctor with one of the largest practices in London, counting among his patients some of the most distinguished men of the day. The great number of persons who passed through his consulting-room every morning rendered it inevitable that to a large extent his advice should become stereotyped and his prescriptions often reduced to mere stock formulae, but in really serious cases he was not to be surpassed in the skill and carefulness of his diagnosis and in his attention to detail. In spite of the claims of his practice he found time to produce a good many books, all written in the precise and polished style on which he used to pride himself. Doubtless owing largely to personal reasons, lung diseases and especially fibroid phthisis formed his favourite theme, but he also discussed other subjects, such as renal inadecquacy, anaemia, constipation, &c. He died in London on the 6th of November 1893, after a paralytic stroke which was probably the result of overwork.

CLARK, Francis Edward (1851— ), American clergyman, was born of New England ancestry at Aylmer, Province of Quebec, Canada, on the 12th of September 1851. He was the son of Charles C. Symmes, but took the name of an uncle, the Rev. E. W. Clark, by whom he was adopted after his father’s death in 1853. He graduated at Dartmouth College in 1873 and at Andover Theological Seminary in 1876, was ordained in the Congressional church, was pastor of the Williston Congregational church at Portland, Maine, from 1876 to 1881, and of the Phillips Congregational church, South Boston, Mass., from 1883 to 1887. On the 2nd of February 1888 he founded at Portland the Young People’s Society of Christian Endeavor, which, beginning as a small society in a single New England church, developed into a great interdenominational organization, which in 1908 had 70,761 societies and more than 3,500,000 members scattered throughout the United States, Canada, Great Britain, Australia, South Africa, India, Japan and China. After 1887 he devoted his time entirely to the extension of this work, and was president of the United Societies of Christian Endeavor and of the World’s Christian Endeavor Union, and editor of the Christian Endeavor World (originally The Golden Rule). Among his numerous publications are The Children and the Church (1882); Looking Out on Life (1883); Young People’s Prayer Meetings (1884); Some Christian Endeavor Saints (1888); World Wide Endeavor (1893); A New Way Round an Old World (1900).
See his *The Young People's Christian Endeavor, where it began*, 2 vols. (Boston, 1895); *Christian Endeavor Manual* (Boston, 1903); and *Christian Endeavor in All Lands: Record of Twenty-Five Years of Progress* (Philadelphia, 1907).

**CLARK, GEORGE ROGERS** (1752–1818). American frontier military leader, was born near Charlottesville, in Albemarle county, Virginia, on the 10th of November 1752. Early in life he became a land-surveyor; he took part in Lord Dunmore's War (1774), and in 1775 went as a surveyor for the Ohio Company to Kentucky (then a district of Virginia), whither he removed early in 1776. His iron will, strong passions, audacious courage and magnificent physique soon made him a leader among his frontier neighbours, by whom in 1776 he was sent as a delegate to the Virginia legislature. In this capacity he was instrumental in bringing about the organization of Kentucky as a county of Virginia, and also obtained from Governor Patrick Henry a supply of powder for the Kentucky settlers. Convinced that the Indians were instigated and supported in their raids against the American settlers by British officers stationed in the forts north of the Ohio river, and that the conquest of those forts would put an end to the evil, he went on foot to Virginia late in 1777 and submitted to Governor Henry and his council a plan for offensive operations. On the 2nd of January 1778 he was commissioned lieutenant-colonel, received £1200 in depreciated currency, and was authorized to enlist troops; and by the end of May he was at the falls of the Ohio (the site of Louisville) with about 175 men. The expedition proceeded to Fort Kaskaskia, on the Mississippi, in what is now Illinois. This place and Cahokia, also on the Mississippi, near St Louis, were defended by small British garrisons, which depended upon the support of the French habitants. The French being willing to accept the authority of Virginia, both forts were easily taken. Clark gained the friendship of Father Pierre Gibault, the priest at Kaskaskia, and through his influence the French at Vincennes on the Wabash were induced (late in July) to change their allegiance. On the 17th of December Lieut.-Governor Henry Hamilton, the British commander at Detroit, recovered Vincennes and went into winter quarters. Late in February 1779 he was surprised by Clark and compelled to give up Vincennes and its fort, Fort Sackville, and to surrender himself and his garrison of about 80 men, as prisoners of war. With the exception of Detroit and several other posts on the Canadian frontier the whole of the North-West was thus brought under American influence; many of the Indians, previously hostile, became friendly, and the United States was put in a position to demand the cession of the North-West in the treaty of 1783. For this valuable service, in which Clark had freely used his own private funds, he received practically no recompense either from Virginia or from the United States, and for many years before his death he lived in poverty. To him and his men, however, the Virginia legislature granted 150,000 acres of land in 1781, which was subsequently located in what are now Clark, Floyd and Scott counties, Indiana; Clark's individual share was 8494 acres, but from this he realized little. Clark built Fort Jefferson on the Mississippi river to guard the mouth of the Ohio, in 1786, destroyed the Indian towns Chillicothe and Piqua in the same year, and in November 1782 destroyed the Indian towns on the Miami river. With this last expedition his active military service virtually ended, and in July 1783 he was relieved of his command by Virginia. Thereafter he lived on part of the land granted to him by Virginia or in Louisville for the rest of his life. In 1793 he accepted from Citizen Genet a commission as "major-general in the armies of France, and commander-in-chief of the French Revolutionary Legion in the Mississippi Valley," and tried to raise a force for an attack upon the Spanish possessions in the valley of the Mississippi. The scheme, however, was abandoned after Genet's recall. Disappointed at what he regarded as his country's ingratitude, and broken down by excessive drinking and paralysis, he lost his once powerful influence and lived in comparative isolation until his death, near Louisville, Kentucky, on the 13th of February 1818.

See W. H. English, *Conquest of the Country north-west of the River Ohio, 1778–1783*, and *Life of George Rogers Clark* (2 vols., Indianapolis and Kansas City, 1896), an accurate and detailed work, which represents an immense amount of research among both printed and manuscript sources. Clark's own accounts of his expeditions, and other interesting documents, are given in the appendix to this work.

**CLARK, WILLIAM** (1779–1838), the well-known explorer, was the youngest brother of the foregoing. He was born in Caroline county, Virginia, on the 1st of August 1779. At the age of fourteen he removed with his parents to Kentucky, settling at the falls of the Ohio (Louisville). He entered the United States army as a lieutenant of infantry in March 1792, and served under General Anthony Wayne against the Indians in 1794. In July 1796 he resigned his commission on account of ill-health. In 1803–1806, with Meriwether Lewis (q.v.), he commanded the famous exploring expedition across the continent to the mouth of the Columbia river, and was commissioned second lieutenant in March 1804 and first lieutenant in January 1806. In February he again resigned from the army. He then served for a few years as brigadier-general of the Louisiana territorial militia, as Indian agent for "Upper Louisiana," as territorial governor of Missouri in 1813–1826, and as superintendent of Indian affairs at St Louis from 1822 until his death there on the 1st of September 1838.

**CLARK, SIR JAMES** (1788–1879), English physician, was born at Cullen, Banffshire, and was educated at the grammar school of Fordyce and at the universities of Aberdeen and Edinburgh. He served for six years as a surgeon in the army; then spent some time travelling on the continent, in order to investigate the mineral waters and the climate of various health resorts; and for seven years he lived in Rome. In 1826 he began to practise in London. In 1835 he was appointed physician to the duchess of Kent, becoming physician in ordinary to Queen Victoria in 1837. In 1838 he created a baronet. He published *The Influence of Climate in Chronic Diseases*, containing valuable meteorological tables (1820), and a *Treatise on Pulmonary Consumption* (1835).

**CLARK, JOHN** (1847–). American economist, was born at Providence, Rhode Island, on the 6th of January 1847. Educated at Brown University, Amherst College, Heidelberg and Zurich, he was appointed professor of political economy at Carleton College, Minnesota, in 1877. In 1881 he became professor of history and political science in Smith College, Massachusetts; in 1892 professor of political economy in Amherst College. He was appointed professor of political economy at Columbia University in 1895. Among his works are: *The Philosophy of Wealth* (1885); *Wages* (1886); *Capital and its Earnings* (1888); *The Control of Trusts* (1901); *The Problem of Monopoly* (1904); and *Essentials of Economic Theory* (1907).

**CLARK, JOSIAH LATIMER** (1822–1898). English engineer and electrician, was born on the 10th of March 1822 at Great Marlow, Bucks. His first interest was in chemical manufacturing, but in 1848 he became assistant engineer at the Menai Straits bridge under his elder brother Edwin (1814–1894), the inventor of the Clark hydraulic lift graving dock. Two years later, when his brother was appointed engineer to the Electric Telegraph Company, he again acted as his assistant, and subsequently succeeded him as chief engineer. In 1854 he took out a patent for "conveying letters or parcels between places by the pressure of air and vacuum," and later was concerned in the construction of a large pneumatic dispatch tube between the general post office and Euston station, London. About the same period he was engaged in experimental researches on the propagation of the electric current in submarine cables, on which he published a pamphlet in 1855, and in 1859 he was a member of the committee which was appointed by the government to consider the numerous failures of submarine cable enterprises. Latimer Clark paid much attention to the subject of electrical measurement, and besides designing various improvements in method and apparatus and inventing the Clark standard cell, he took a leading part in the movement for the systematization of electrical standards, which was inaugurated by the paper which he and Sir
CLARK, T.—CLARKE, C. C.

C. T. Bright read on the question before the British Association in 1861. With Bright also he devised improvements in the insulation of submarine cables. In the later part of his life he was a member of several firms engaged in laying submarine cables, in manufacturing electrical appliances, and in hydraulic engineering. He died in London on the 30th of October 1898. Besides professional papers, he published an *Elementary Treatise on Electrical Measurement* (1868), together with two books on astronomical subjects, and a memoir of Sir W. F. Cooke.

CLARK, THOMAS (1806—1867), Scottish chemist, was born at Ayr on the 31st of March 1806. In 1826 he was appointed lecturer on chemistry at the Glasgow mechanics' institute, and in 1831 he took the degree of M.D. at the university of that city. Two years later he became professor of chemistry in Marischal College, Aberdeen, but was obliged to give up the duties of that position in 1844 through ill-health, though nominally he remained professor till 1866. His name is chiefly known in connexion with his process for softening hard waters, and his water tests, patented in 1841. The last twenty years before his death at Glasgow on the 27th of November 1867 were occupied with the study of the historical origin of the Gospels.

CLARK, WILLIAM GEORGE (1821—1878), English classical and Shakespearean scholar, was born at Barford Hall, Darlington, in March 1821. He was educated at Sedbergh and Shrewsbury schools and Trinity College, Cambridge, where he was elected fellow after a brilliant university career. In 1857 he was appointed public orator. He travelled much during the long vacations, visiting Spain, Greece, Italy and Poland. His *Peloponnesus* (1858) was an important contribution to the knowledge of the country at that time. In 1853 Clark had taken orders, but left the Church in 1870 after the passing of the Clerical Disabilities Act, of which he was one of the promoters. He also resigned the public oratorship in the same year, and in consequence of illness left Cambridge in 1873. He died at York on the 6th of November 1878. He bequeathed a sum of money to his old college for the foundation of a lectureship in English literature. Although Clark was before all a classical scholar, he published little in that branch of learning. A contemplated edition of the works of Aristophanes, a task for which he was singularly fitted, was never published. He visited Italy in 1868 for the express purpose of examining the Ravenna and other MSS., and on his return began the notes to the *Acharnians*, but they were left in too incomplete a state to admit of publication in book form even after his death (see *Journal of Philology*, viii., 1879). He established the Cambridge *Journal of Philology*, and cooperated with B. H. Kennedy and James Riddell in the production of the well-known *Sabrinae Corolla*. The work by which he is best known is the Cambridge *Shakespeare* (1863—1866), containing a collation of early editions and selected emendations, edited by him at first with John Glover and afterwards with W. Aldis Wright. *Gaspacho* (1855) gives an account of his tour in Spain; his visits to Italy at the time of Garibaldi's insurrection, and to Constantinople in 1863, are described in *Vacation Tourists*, ed. F. Galton, i. and iii.

H. A. J. Munro in *Journal of Philology* (viii. 1879) describes Clark as “the most accomplished and versatile man he ever met” ; see also notices by W. Aldis Wright in *Academy* (Nov. 23, 1878); R. B. H. Kennedy in *Times* (Nov. 16, 1878); *The Times* (Oct. 8, 1878); *Notes and Queries*, 5th series, x. (1878), p. 400.

CLARKE, ADAM (1762—1832), British Nonconformist divine, was born at Moybeg, Co. Londonderry, Ireland, in 1760 or 1762. After receiving a very limited education he was apprenticed to a linen manufacturer, but, finding the employment uncongenial, he resumed school-life at the institution founded by Wesley at Kingswood, near Bristol. In 1782 he entered on the duties of the ministry, being appointed by Wesley to the Bradford (Wilts) circuit. His popularity as a preacher was very great, and his influence in the denomination is indicated by the fact that he was three times (1806, 1814, 1822) chosen to be president of the conference. He served twice on the London circuit, the second period being extended considerably longer than the rule allowed, at the special request of the British and Foreign Bible Society, who had employed him in the preparation of their Arabic Bible. Though ardent in his pastoral work, he found time for diligent study of Hebrew and other Oriental languages, undertaken chiefly for the view of qualifying himself for the great work of his life, his *Commentary on the Holy Scriptures* (8 vols., 1819—1826). In 1802 he published a *Biblical Dictionary* in six volumes, to which he afterwards added a supplement. He was selected by the Records Commission to re-edit Rymer's *Foedera*, a task which after ten years' labour (1808—1818) he had to resign. He also wrote *Memoirs of the Wesley Family* (1823), and edited a large number of religious works. Honours were showered upon him (he was M.A., L.L.D. of Aberdeen), and many distinguished men in church and state were his personal friends. He died in London on the 16th of August 1832.

His *Miscellaneous Works* were published in 13 vols. (1836), and a *Life* (3 vols.) by his son, J. B. B. Clarke, appeared in 1853.

CLARKE, SIR ANDREW (1824—1902), British soldier and administrator, son of Colonel Andrew Clarke, of Co. Donegal, Ireland, governor of West Australia, was born at Southsea, England, on the 27th of July 1824, and educated at King's School, Canterbury. He entered the Royal Military Academy, Woolwich, and obtained his commission in the army in 1844 as second lieutenant in the Royal Engineers. He was appointed to his father's staff in West Australia, but was transferred to be A.D.C. and military secretary to the governor of Tasmania; and in 1847 he went to New Zealand to take part in the Maori War, and for some years served on Sir George Grey's staff. He was then made surveyor-general in Victoria, took a prominent part in framing its new constitution, and held the office of minister of public lands during the first administration (1855—1857). He returned to England in 1857, and in 1863 was sent on a special mission to the West Coast of Africa. In 1864 he was appointed director of works for the navy, and held this post for nine years, being responsible for great improvements in the naval arsenals at Chatham, Portsmouth and Plymouth, and for fortifications at Malta, Cork, Bermuda and elsewhere. In 1873 he was made K.C.M.G., and became governor of the Straits Settlements, where he did most valuable work in consolidating British rule and ameliorating the condition of the people. From 1875 to 1880 he was minister of public works in India; and on his return to England in 1881, holding then the rank of lieutenant-colonel in the army, he was first appointed commandant at Chatham and then inspector-general of fortifications (1882—1886). Having attained the rank of lieutenant-general and been created G.C.M.G., he retired from official life, and in 1886 and 1893 unsuccessfully stood for parliament as a supporter of Mr Gladstone. During his last years he was agent-general for Victoria. He died on the 29th of March 1902.

Both as a technical and strategical engineer and as an Imperial administrator Sir Andrew Clarke was one of the ablest and most useful public servants of his time; and his contributions to periodical literature, as well as his official memoranda, contained valuable suggestions on the subjects of imperial defence and colonial consolidation which received too little consideration at a period when some government were not properly alive to their importance. He is entitled to remain as one of those who first inculcated, from a wide practical experience, the views of imperial administration and its responsibilities, which in his last years he saw accepted by the bulk of his countrymen.

CLARKE, CHARLES COWDEN (1787—1877), English author and Shakespearean scholar, was born at Enfield, Middlesex, on the 15th of December 1787. His father, John Clarke, was a schoolmaster, among whose pupils was John Keats. Charles Clarke taught Keats his letters, and encouraged his love of poetry. He knew Charles and Mary Lamb, and afterwards became acquainted with Shelley, Leigh Hunt, Coleridge and Hazlitt. Clarke became a music publisher in partnership with Alfred Novello, and married in 1828 his partner's sister, Mary Victoria (1809—1868), the eldest daughter of Vincent Novello. In the year after her marriage Mrs Cowden Clarke began her valuable Shakespeare concordance, which was eventually
CLARKE, E. D.—CLARKE, J. F.

issued in eighteen monthly parts (1844-1845), and in volume form in 1845 as The Complete Concordance to Shakespeare, being a Verbally Corrected and Concise Vocabulary to all the Passages in the Dramatic Works of the Poet. This work superseded the Copious Index to . . . Shakespeare (1790) of Samuel Ayscough, and the Complete Verbal Index . . . (1805-1807) of Francis Twiss. Charles Cowden Clarke published many useful books, and edited the text for John Nichol's edition of the British Poets; but his most important work consisted of lectures delivered between 1834 and 1866 on Shakespeare and other literary subjects. Some of the more notable series were published, among them being Shakespeare's Characters, chiefly those subordinate (1865), and Melville's Characters (1865). In 1859 he published a volume of original poems, Carmina Minima. For some years after their marriage the Cowden Clarkes lived with the Novellos in London. In 1849 Vincent Novello with his wife removed to Nice, where he was joined by the Clarkes in 1856. After his death they lived at Genoa at the "Villa Novello." They collaborated in The Shakespeare Key, unlocking the Treasures of his Style . . . (1879), and in an edition of Shakespeare for Messrs Cassell, which was issued in weekly parts, and completed in 1881. It was prefaced by a long Introduction.

Charles Clarke died on the 13th of March 1872 at Genoa, and his wife survived him until the 12th of January 1898. Among Mrs Cowden Clarke's other works may be mentioned The Girlhood of Shakespeare's Heroines (3 vols., 1830-1832), and a translation of Berlioz's Treatise upon Modern Instrumentation and Orchestration (1836). See Recollections of Writers (1898), a joint work by the Clarkes containing letters and reminiscences of their many literary friends; and Mary Cowden Clarke's autobiography, My Long Life (1896). A charming series of letters (1850-1861), addressed by her to an American admirer of her work, Robert Balmano, was edited by Anne Upton Nettleton as Letters to an Enthusiast (Chicago, 1902).

CLARKE, EDWARD DANIEL (1769-1822), English mineralogist and traveller, was born at Willington, Sussex, on the 5th of June 1769, and educated first at Tonbridge. In 1786 he obtained the office of chapel clerk at Jesus College, Cambridge, but the loss of his father at this time involved him in difficulties. In 1790 he took his degree, and soon after became private tutor to Henry Tufton, nephew of the duke of Norfolk. In 1792 he obtained an engagement to travel with Lord Berwick through Germany, Switzerland and Italy. After crossing the Alps, and visiting a few of the principal cities of Italy, including Rome, he went to Naples, where he remained nearly two years. Having returned to England in the summer of 1794, he became tutor in several distinguished families. In 1799 he set out with a Mr Cripps on a tour through the continent of Europe, beginning with Norway and Sweden, whence they proceeded through Russia and the Crimea to Constantinople, Rhodes, and afterwards to Egypt and Palestine. After the capitulation of Alexandria, Clarke was of considerable use in securing for England the statues, sarcophagi, maps, manuscripts, &c., which had been collected by the French savants. Greece was the country next visited. From Athens the travellers proceeded by land to Constantinople, and after a short stay in that city directed their course homewards through Rumelia, Austria, Germany and France. Clarke, who had now obtained considerable reputation, took up his residence in London, and in 1805 obtained his degree of LL.D. shortly after his return in 1805, on account of the valuable donations, including a colossal statue of the Eleusinian Ceres, which he had made to the university. He was also presented to the college living of Harston, near Cambridge, in 1805, to which, four years later, his father-in-law added that of Yeldham. Towards the end of 1808 Dr Clarke was appointed to the professorship of mineralogy in Cambridge, then first instituted. Nor was his perseverance as a traveller otherwise unrewarded. The MSS. which he had collected in the course of his travels were sold to the Bodleian library for £1000; and by the publication of his travels he realized altogether a clear profit of £6595. Besides lecturing on mineralogy and discharging his clerical duties, Dr Clarke eagerly prosecuted the study of chemistry, and made several discoveries, principally by means of the gas blow-pipe, which he had brought to a high degree of perfection. He was also appointed university librarian in 1817, and was one of the founders of the Cambridge Philosophical Society in 1819. He died in London on the 5th of March 1822. The following is a list of his principal works:

Testimony of Authors respecting the Colossal Statue of Ceres in the Public Library, Cambridge (8vo, 1801-1803); The Tomb of Alexander, a Dissertation on the Sarcophagus brought from Alexandria, and now in the British Museum (4to, 1855); A Methodical Distribution of the Mineral Kingdom (fol. Lewis, 1807); A Description of the Greek Marbles brought from the Shores of the Euxine, Archipelago and Mediterranean, and deposited in the University Library, Cambridge (8vo, 1809); Travels in various Countries of Europe, Asia and Africa (4to, 1810-1815; 2nd ed., 1821-1823). See Life and Remains, by Rev. W. Occer (1874).

CLARKE, SIR EDWARD GEORGE (1841— ), English lawyer and politician, son of J. G. Clarke of Moorgate Street, London, was born on the 15th of February 1841. In 1859 he became a writer in the India office, but resigned in the next year, and became a law reporter. He obtained a Tancred law scholarship in 1861, and was called to the bar at Lincoln's Inn in 1864. He joined the home circuit, and was Q.C. in 1890 and a bencher of Lincoln's Inn in 1882. In November 1877 he was successful in securing the acquittal of Chief-Inspector Clarke from the charge brought against certain Scotland Yard officials of conspiracy to defeat justice, and his reputation was assured by his defence of Patrick Stanton in the Penge murder case (1877), and of Mrs Bartlett against the charge of poisoning her husband (1886). Among other notable cases he was counsel for the plaintiff in the libel action brought by Sir William Gordon-Cumming (1890) against Mr and Mrs Lyckett Green and others for slander, charging him with cheating in the game of baccarat (in this case the prince of Wales, afterwards Edward VII., gave evidence), and he appeared for Dr Jameson, Sir John Willoughby and others when they were tried (1896) under the Foreign Enlistment Act. He was knighted in 1886. He was returned as Conservative member for Southwark at a by-election early in 1880, but failed to retain his seat at the general election which followed a month or two later; he stood a seat at Plymouth, however, which he retained until 1900. He was solicitor-general in the Conservative administration of 1886-1892, but declined office under the Unionist government of 1895 when the law officers of the crown were debarred from private practice. The most remarkable, perhaps, of his speeches in the House of Commons was his reply to Mr Gladstone on the second reading of the Home Rule Bill in 1893. In 1899 differences which arose between Sir Edward Clarke and his party on the subject of the government's South African policy led to his resigning his seat. At the general election of 1906 he was returned at the head of the poll for the city of London, but he offended a large section of his constituents by a speech against tariff reform in the House of Commons on the 12th of March, and shortly afterwards he resigned his seat on grounds of health. He published a Treatise on the Law of Extiradition (4th ed., 1903), and also three volumes of his political and forensic speeches.

CLARKE, JAMES FREEMAN (1810—1888), American preacher and author, was born in Hanover, New Hampshire, on the 4th of April 1810. He was prepared for college at the public Latin school of Boston, and graduated at Harvard College in 1830, and at the Harvard Divinity School in 1833. He was then ordained as minister of a Unitarian congregation at Louisville, Kentucky, which was then a slave state. Clarke soon threw himself heart and soul into the national movement for the abolition of slavery, though he was never what was then called in America a "radical abolitionist." In 1836 he returned to Boston, where he and his friends established (1841) the "Church of the Disciples." It brought together a body of men and women active and eager in applying the Christian religion to the social problems of the day, and he would have said that the feature which distinguished it from any other church was that they also were ministers of the highest religious life. Ordination could make no distinction between him and them. Of this church he was the minister from 1841 until 1830 and from 1834 until his death. He was also
secretary of the Unitarian Association and, in 1867-1871 professor of natural religion and Christian doctrine at Harvard. From the beginning of his active life he wrote freely for the press. From 1860 he was editor of the Western Messenger, a magazine intended to carry to readers in the Mississippi Valley simple statements of "liberal religion," involving what were then the most radical appeals as to national duty, especially the abolition of slavery. The magazine is now of value to collectors because it contains the earliest printed poems of Ralph Waldo Emerson, who was Clarke's personal friend. Most of Clarke's earlier published writings were addressed to the immediate need of establishing a larger theory of religion than that espoused by people who were still trying to be Calvinists, people who maintained what a good American phrase calls "hard-shell churches." But it would be wrong to call his work controversial. He was always declaring that the business of the Church is Eirenic and not Polemic. Such books as Orthodoxy: Its Truths and Errors (1866) have been read more largely by members of orthodox churches than by Unitarians. In the great moral questions of his time Clarke was a fearless and practical advocate of the broadest statement of human rights. Without caring much what company he served in, he could always be seen and heard, a leader of unflinching courage, in the front rank of the battle. He published but few verses, but at the bottom he was a poet. He was a diligent and accurate scholar, and among the books by which he is best known is one called Ten Great Religions (2 vols., 1871-1883). Few Americans have done more than Clarke to give breadth to the published discussion of the subjects of literature, ethics and religious philosophy. Among his later books are Every-Day Religion (1886) and Sermons on the Lord's Prayer (1888). He died at Jamaica Plain, Mass., on the 8th of June 1888.

His Autobiography, Diary and Correspondence, edited by Edward Everett Hale, was published in 1891. (E. E. H.)

CLARKE, JOHN SLEEPER (1835-1890), American actor, was born in Baltimore, Maryland, on the 3rd of September 1835, and was educated for the law. He made his first appearance in Boston at Frank Hardy in Paul Pry in 1857. In 1859 he married Asia Booth, daughter of Junius Brutus Booth, and he was associated with his brother-in-law Edwin Booth in the management of the Winter Garden theatre in New York, the Walnut Street theatre in Philadelphia and the Boston theatre. In 1867 he went to London, where he made his first appearance at the St James's as Major Wellington de Boots in Stirling Coynes's Everybody's Friend, rewritten for him and called The Widow's Hunt. His success was so great that he remained in England for the rest of his life, except for four visits to America. Among his favourite parts were Toodles, which ran for 200 nights at the Strand, Dr Pangloss in The Heir-at-law, and Dr Ollapod in The Poor Gentleman. He managed several London theatres, including the Haymarket, where he preceded the Bancrofts. He retired in 1889, and died on the 24th of September 1890. His two sons also were actors.

CLARKE, WILLIAM ANDREW HISLOP (1846-1881), Australian author, was born in London on the 24th of April 1846. He was the only son of William Hislop Clarke, a barrister of the Middle Temple who died in 1863. He emigrated to Australia, where his uncle, James Langton Clarke, was a county court judge. He was at first a clerk in the bank of Australasia, but showed no business ability, and soon proceeded to learn farming at a station on the Wimmera river, Victoria. He was already writing stories for the Australian Magazine, when in 1867 he joined the staff of the Melbourne Argus through the introduction of Dr Robert Lewins. He also became secretary (1872) to the trustees of the Melbourne public library and later (1876) assistant librarian. He founded in 1868 the Yorick Club, which soon numbered among its members the chief Australian men of letters. The most famous of his books is For the Term of his Natural Life (Melbourne, 1874), a powerful tale of an Australian penal settlement, which originally appeared in serial form in a Melbourne paper. He also wrote The Peripatetic Philosopher (1869), a series of amusing papers reprinted from The Australi-
Meanwhile he had been presented by Bishop Moore to the rectory of Drayton near Norwich. As Boyle lecturer, he dealt in 1701 with the Being and Attributes of God, and in 1705 with the Evidence of Natural and Revealed Religion. These lectures, first printed separately, were afterwards published together under the title of A Discourse concerning the Being and Attributes of God, the Obligations of Natural Religion, and the Truth and Certainty of the Christian Revelation, in opposition to Hobbes, Spinoza, the author of the Oracles of Reason, and other Deniers of Natural and Revealed Religion.

In 1706 he wrote a refutation of Dr Henry Dodwell's views on the immortality of the soul, and this drew him into controversy with Anthony Collins. He also wrote at this time a translation of Newton's Optics, for which the author presented him with £500. In the same year through the influence of Bishop Moore, he obtained the rectory of St Benet's, Paul's Wharf, London. Soon afterwards Queen Anne appointed him one of her chaplains in ordinary, and in 1709 presented him to the rectory of St James's, Westminster. He then took the degree of doctor in divinity, defending as his thesis the two propositions: Nihil facit Christianae dogma, in Sacris Scripturis traditum, et rectius ratio divinorum, non dissimulans, et S.n. actum humanum libertatis nulla potest esse religio. During the same year, at the request of the author, he revised Whiston's English translation of the Apostolical Constitutions.

In 1712 he published a carefully punctuated and annotated edition (folio 1712, octavo 1720) of Caesar's Commentaries, with elegant engravings, dedicated to the duke of Marlborough. During the same year he published his celebrated treatise on The Scripture Doctrine of the Trinity. It is divided into three parts. The first contains a collection and exegesis of all the texts in the New Testament relating to the doctrine of the Trinity; in the second the doctrine is set forth at large, and explained in particular and distinct propositions; and in the third the principal passages in the liturgy of the Church of England relating to the doctrine of the Trinity are considered. Whiston informs us that, some time before the publication of this book, a message was sent to him from Lord Godolphin “that the affairs of the public were with difficulty then kept in the hands of those that were for liberty; that it was therefore an unreasonable time for the publication of a book that would make a great noise and disturbance; and that therefore they desired him to forbear till a proper opportunity should offer itself,”—a message that Clarke of course entirely disregarded. The ministers were right in their conjectures; and the work not only provoked a great number of replies, but occasioned a formal complaint from the Lower House of Convocation. Clarke, in reply, drew up an apologetic preface, and afterwards gave several explanations, which satisfied the Upper House; and, on his pleading himself that his future conduct would occasion no trouble, the matter dropped.

In 1715 and 1716 he had a discussion with Leibnitz relative to the principles of natural philosophy and religion, which was at length cut short by the death of his antagonist. A collection of the papers which passed between them was published in 1717 (cf. G. v. LeRoy, Die phils. Probleme in dem Briefwechsel Leibnitz und Clarke, Giessen, 1893). In 1719 he was presented by Nicholas Montagu, 2nd Earl of Sandwich, to the mastership of Wigston's hospital in Leicester. In 1720 he published thirteen sermons of which had not before been printed. In 1727, on the 11th of May, Sir Isaac Newton, he was offered by the court the place of master of the mint, worth on an average from £2,000 to £3,500 a year. This secular preferment, however, he absolutely refused.

In 1728 was published ‘A Letter from Dr Clarke to Benjamin Hoadly, F.R.S., occasioned by the controversy relating to the Proportion of Velocity and Force in Bodies in Motion,” printed in the Philosophical Transactions. In 1729 he published the first twelve books of Homer's Iliad. This edition, dedicated to William Augustus, duke of Cumberland, was highly praised by Bishop Hoadly. On Sunday, the 11th of May 1729, when going out to preach before the judges at Serjeants' Inn, he was seized with a sudden illness, which caused his death on the Saturday following (May 17, 1729).

Soon after his death his brother Dr John Clarke, dean of Sarum, published, from his original manuscripts, An Exposition of the Church Catechism, and ten volumes of the

The Exposition is composed of the lectures which he read every Thursday morning, for some months in the year, at St James's church. In the latter part of his life he revised them with great care, and left them completely prepared for the press. Three years after his death appeared the last twelve books of the Iliad, published by his son Samuel Clarke, the first three of these books and part of the fourth having, as he states, been revised and annotated by his father.

In disposition Clarke was cheerful and even playful. An intimate friend relates that he once found him swimming upon a table. At another time Clarke on looking out at the window saw a grave blockhead approaching the house; upon which he cried out, "Boys, boys, be wise; here comes a fool." Dr Warton, in his observations upon Pope's line,

"Unthought-of frisities cheat us in the wise,"
says, "Who could imagine that Locke was fond of romances; that Newton once studied astrology; that Dr Clarke valued himself on his agility, and frequently amused himself in a private room of his house in leaping over the tables and chairs?"

Philosophy.—Clarke, though in no way an original thinker, was extensively read in theological mathematics, metaphysics and moral philosophy. In the latter part of his life he espoused the Anglican way of thinking, and was known as a supporter of the clergymen of the Church of England. He was a staunch supporter of the royal authority in England, and his religious views were strongly influenced by the political climate of the times. Clarke's writings were characterized by a strong sense of moral obligation, and he believed that the Bible was the ultimate authority for religious and moral conduct.

Clarke's most significant work was his defense of the existence of God and the nature of the universe. He believed in the existence of God and the immortality of the soul, and he developed a comprehensive system of metaphysics and natural philosophy. Clarke was known for his clear and concise style, and his works were widely read and influential in their time. His works continue to be studied and debated by scholars today.
CLARKE, T. S.—CLARSON

Jouffroy, Amédée Jacques, Sir James Mackintosh, Thomas Brown and others. It is said, for example, that Clarke made virtue consist in conformity to the relations of things universally, although the whole tenor of his argument shows him to have in view conformity to such relations only as belong to the sphere of moral agency. It is true that he might have emphasized the relation of moral fitness to the will, and in this respect J. F. Herbart (q.v.) improved on Clarke's statement of the case. To say, however, that Clarke's metaphysics and morality, by failing to establish the moral criterion on a mathematical basis is a mistake. He compared the two subjects for the sake of the analogy.

Though Clarke can thus be defended against this and similar criticism, it is as a whole, and regarded on the attempt to present the doctrines of the Cartesian school in a form which would not shackle the conscience of his time. His work contains a measure of rationalism sufficient to arouse the suspicion of orthodox theologians, without making any valuable addition to, or modification of, the underlying doctrine.

CLARKE, THOMAS SHIELDS (1860—), American artist, was born in Pittsburg, Pennsylvania, on the 25th of April 1860, and graduated at Princeton in 1882. He was a pupil of the Art Students' League, New York, and of the École des Beaux Arts, Paris, under J. L. Gérôme; later he entered the atelier of Dagnan-Bouveret, and, becoming interested in sculpture, worked for a while under Henri M. Chapu. As a sculptor, he received a medal of honour in Madrid for his "The Cider Press," now in the golden Gate Park, San Francisco, California, and he made four caryatides of "The Seasons" for the Appellate Court House, New York. He designed an "Alma Mater" for Princeton University, and a model is in the library. Among his paintings are his "Night Market in Morocco" (Philadelphia Art Club), for which he received a medal at the International Exposition in Berlin in 1892, and his "A Fool's Fool," exhibited at the Salon in 1887 and now in the collection of the Pennsylvanian Academy of Fine Arts, Philadelphia.

CLARKE, WILLIAM BRANWY (1798-1878), British geologist, was born at East Bergholt, in Suffolk, on the 2nd of June 1798. He received his early education at Dedham grammar school, and in 1817 entered Jesus College, Cambridge; he took his B.A. in 1821, was ordained and became M.A. in 1824. In 1821 he was appointed curate of Ramsholt in Suffolk, and he acted in his clerical capacity in other places until 1839. Having become interested in geology through the teachings of Sedgwick, he utilized his opportunities and gathered many interesting facts on the geology of East Anglia which were embodied in a paper "On the Geological Structure and Phenomena of Suffolk" (Trans. Geol. Soc. 1837). He also communicated a series of papers on the geology of S.E. Dorsetshire to the Magazine of Nat. Hist. (1837-1838). In 1839, after a severe illness, he left England for New South Wales, mainly with the object of benefiting by the sea voyage. He remained, however, in that country, and came to be regarded as the "Father of Australian Geology." From the date of his arrival in New South Wales until 1870 he was in clerical charge first of the country from Paramatta to the Hawkesbury, and then of the country of Castlemaine, and finally of Willoughby. He zealously devoted attention to the geology of the country, with results that have been of paramount importance. In 1841 he discovered gold, being the first explorer who had obtained it in situ in the country, finding it both in the detrital deposits and in the quartzites of the Blue Mountains, and then declared his belief in its abundance. In 1849 he made the first actual discovery of tin in Australia, and in 1859 he made known the occurrence of the diamond. He was also the first to indicate the presence of Silurian rocks, and to determine the age of the coal-bearing rocks in New South Wales. In 1860 he announced the discovery of remains of Dinornis in Queensland. He was a trustee of the Australian museum at Sydney, and an active member of the Royal Society of New South Wales. In 1860 he published Researches in the Southern Gold-fields of New South Wales. He was elected F.R.S. in 1876, and in the following year was awarded the Murchison medal by the Geological Society of London. His contributions to Australian scientific journals were numerous. He died near Sydney, on the 17th of June 1878.

CLARKSON, THOMAS (1786-1846), English anti-slavery agitator, was born on the 28th of March 1786, at Wisbeach, in Cambridgeshire, where his father was headmaster of the free grammar school. He was educated at St Paul's school and at St John's College, Cambridge. Having taken the first place among the middle bachelors as Latin essayist, he succeeded in 1878 in gaining a similar honour among the senior bachelors. The subject appointed by the vice-chancellor, Dr Peckhard, was one in which he was himself deeply interested—"Anne liceat invitissim in servitutem dare?" (Is it right to make men slaves against their will?). In preparing for this essay Clarkson consulted a number of works on African slavery, of which the chief was Benezet's Historical Survey of New Guinea; and the atrocities which he had read affected him so deeply that he determined to devote all his time to the abolition of the slave trade, and gave up his intention of entering the Church.

His first measure was to publish, with additions, an English translation of his prize essay (June 1786). He then commenced to search in all quarters for information concerning slavery. He soon discovered that the cause had already been taken up to some extent by others, most of whom belonged to the Society of Friends, and among the chief of whom were William Dillwyn, Joseph Wood and Granville Sharp. With the aid of these gentlemen, a committee of twelve was formed in May 1787 to do all that was possible to effect the abolition of the slave trade. Meanwhile Clarkson had also obtained the sympathy of Wilberforce, Whitbread, Sturge, and several other men of influence. Traveling from port to port, he now commenced to collect a large mass of evidence; and much of it was embodied in his Summary View of the Slave Trade, and the Probable Consequences of its Abolition, which, with a number of other anti-slavery tracts, was published by the committee. Pitt, Grenville, Fox and Burke looked favorably on the movement; in May 1788 Pitt introduced a bill for the abolition of the slave trade, but W. Dobbin brought forward a bill providing that the number of slaves carried in a vessel should be proportional to its tonnage. A number of Liverpool and Bristol merchants obtained permission from the House to be heard by council against the bill, but on the 18th of June it passed the Commons. Soon after Clarkson published an Essay on the Impolicy of the Slave Trade; and for two months he was continuously engaged in travelling that he might meet men who were personally acquainted with the facts of the trade. From their lips he collected a considerable amount of evidence; but only nine could be prevailed upon to promise to appear before the privy council. Meanwhile other witnesses had been obtained by Wilberforce and the committee, and on the 12th of May 1789 the former led a debate on the subject in the House of Commons, in which he was seconded by Burke and supported by Pitt and Fox.

It was now the beginning of the French Revolution, and in the hope that he might arouse the French to sweep away slavery with other abuses, Clarkson crossed to Paris, where he remained six months. He found no favourable attitude in the government, and obtained from him some sympathy but little help. Meanwhile, however, with his assistance, prepared a speech against slavery, to be delivered before the National Assembly, and the Marquis de la Fayette entered enthusiastically into his views. During this visit Clarkson met a deputation of negroes from Santo Domingo, who had come to France to present a petition to the National Assembly, desiring to be placed on an equal footing with the whites; but the storm of the Revolution permitted no substantial success to be achieved. Soon after his return home he engaged in a search, the apparent hopelessness of which finely displayed his unshinking laboriousness and his passionate
enthusiasm. He desired to find some one who had himself witnessed the capture of the negroes in Africa; and a friend having met by chance a man-of-war's man who had done so, Clarkson, though ignorant of the name and address of the sailor, set out in search of him, and actually discovered him. His last tour was undertaken in order to form anti-slavery committees in all the principal towns. At length, in the autumn of 1794, his health gave way, and he was obliged to cease active work. He now occupied his time in writing a History of the Abolition of the Slave Trade, which appeared in 1808. The bill for the abolition of the trade became law in 1807; but it was still necessary to secure the assent of the other powers to its principle. To obtain this was, under pressure of the public opinion created by Clarkson and his friends, one of the main objects of British diplomacy at the Congress of Vienna, and in February 1815 the trade was condemned by the powers. The question of concerted practical measures for its abolition was raised at the Congress of Aix-la-Chapelle in 1818, but without result. On this occasion Clarkson personally presented an address to the emperor Alexander I., who communicated it to the sovereigns of Austria and Prussia. In 1823 the Anti-Slavery Society was formed, and Clarkson was one of its vice-presidents. He was for some time blind from cataract; but several years before his death on the 26th of September 1846, his sight was restored.

Besides the works already mentioned, he published the Portraiture of Quakerism (1806), Memoirs of William Penn (1813), Researches, Abridged from the Authentic Records and Historical Writings relative to the interference of Providence for man's spiritual good, and Strictures on several of the remarks concerning himself made in the Life of Wilberforce, in which his claim as originator of the anti-slavery movement is denied.

See the lives by Thomas Elmes (1876) and Thomas Taylor (1839).

CLARKSVILLE, a city and the county-seat of Montgomery county, Tennessee, U.S.A., situated in the N. part of the state, about 50 m. N.W. of Nashville, on the Cumberland river, at the mouth of the Red river. Pop. (1890) 7924; (1900) 9431, of whom 3004 were negroes; (1910 census) 8548. It is served by the Louisville & Nashville, and the Illinois Central railways, and by passenger and freight steamboat lines on the Cumberland river. The city hall and the public library are among the principal public buildings, and the city is the seat of the Tennessee Odd Fellows' home, and of the South-Western Presbyterian University, founded in 1875. Clarksville lies in the center of the dark tobacco belt—commonly known as the Black Patch—and is an important tobacco market, with an annual trade in that staple of about $4,000,000, most of the product being exported to France, Italy, Austria and Spain. The city is situated in a region well adapted for the growing of wheat, Indian corn, and vegetables, and for the raising of live-stock; and Clarksville is a shipping port for the lumber—chiefly oak, poplar and birch—and the iron-ore of the surrounding country, a branch of the Louisville & Nashville railway extending into the iron district. The city's principal manufactures are flour and grit mill products, chewing and smoking tobacco and snuff, furniture, lumber, iron, and pearl buttons. The value of the factory product in 1905 was $2,210,112, being 32% greater than in 1900. The municipality owns its water-works. Clarksville was first settled as early as 1780, was named in honour of General George Rogers Clark, and was chartered as a city in 1850.

CLASSICS. The term "classics" is derived from the Latin epithet classicus, found in a passage of Aulus Gellius (xix. 8. 15), where, in contrast with a "proletarius." The metaphor is taken from the division of the Roman people into classes by Servius Tullius, those in the first class being classici, all the rest infra classem, and those in the last proletarii. The epithet classicus is accordingly applied (1) generally to an author of the first rank, and (2) more particularly to a Greek or Roman author of that character. Similarly, "the classics" is a synonym for the choicest products of the literature of ancient Greece and Rome. It is to this sense of the word that the following article is devoted in two main divisions: (A) the general history of classical (i.e. Greek and Latin) scholarship, and (B) its place in higher education.

(A) GENERAL HISTORY OF THE STUDY OF THE CLASSICS

We may consider this subject in four principal periods:

(i) the Alexandrian, c. 300-1 B.C.; (ii) the Roman, a.d. c. 549;
(iii) the Middle Ages, c. 530-1350; and (iv) the Modern Age, c. 1350 to the present.

(i) The Alexandrian Age.—The study of the Greek classics begins with the school of Alexandria. Under the rule of Ptolemy Philadelphus (285-247 B.C.), learning found a home in the Alexandrian Museum and in the great Alexandrian Library. The first four librarians were Zenodotus, Eratothenes, Aristophanes of Byzantium, and Aristarchus. Zenodotus produced before 274 the first scientific edition of the Iliad and Odyssey, an edition in which spurious lines were marked, at the beginning, with a short horizontal dash called an obelus. He also drew up select lists of epic and lyric poets. Soon afterwards a classified catalogue of dramatists, epic and lyric poets, legislators, philosophers, historians, orators and rhetoricians, and miscellaneous writers, with a brief biography of each, was produced by the scholar and poet Callimachus (fl. 260). Among the pupils of Callimachus was Eratothenes who, in 234, succeeded Zenodotus as librarian. Apart from his special interest in the history of the city, his chief concern was the study of cartography, the founder of astronomical geography and of scientific chronology; and the first to assume the name of philologos. The greatest philologist of antiquity was, however, his successor, Aristophanes of Byzantium (195), who reduced accentuation and punctuation to a definite system, and used a variety of critical symbols in his recession of the Iliad and Odyssey. He also edited Hesiod and Pindar, Euripides and Aristophanes, besides composing brief introductions to the several plays, parts of which are still extant. Lastly, he established a scientific system of lexicography and drew up lists of the "best authors." Two critical editions of the Iliad and Odyssey were produced by his successor, Aristarchus, who was librarian until 146 B.C. and was the founder of scientific scholarship. His distinguished pupil, Dionysius Thrax (born c. 166 B.C.), drew up a Greek grammar which continued in use for more than three centuries. The most industrious of the successors of Aristarchus was Dionysius Thrax (c. 65 B.C. - A.D. 22), who, in his study of the Homeric poems, aimed at restoring the lost recensions of Homer. He also composed commentaries on the lyric and comic poets and on Thucydides and Demosthenes; part of his commentary on this last author was first published in 1904. He was a teacher in Alexandria (and perhaps also in Rome); and his death, about A.D. 10, marks the close of the Alexandrian age. He was the industrious compiler who gathered up the remnants of the learning of his predecessors and transmitted them to posterity. The poets of that age, including Callimachus and Theocritus, were subsequently expounded by Theon, who flourished under Tiberius, and has been well described as "the Didymus of the Alexandrian poets."

The Alexandrian canon of the Greek classics, which probably had its origin in the lists drawn up by Callimachus, Aristophanes of Byzantium and Aristarchus, included the following authors:

- Epic poets (2): Homer, Hesiod, Pindar, Paranyssis, Antimachus.
- Iambic poets (3): Simonides, Bacchylides, Alcaeus.
- Tragic poets (5): Aeschylus, Sophocles, Euripides, Ion, Acharus.
- Comic poets, Old (7): Epicharmus, Cratinus, Eupolis, Aristophanes, Philectares, Crates, Plato.
- Middle (2): Antiphon, Alexis.
- Lyric poets (4): Callinus, Mimnermus, Philetas, Callimachus.

The latest name in the above list is that of Polybius, who died about 123 B.C. Apollonius Rhodius, Aratus and Theocritus were subsequently added to the "epic" poets. Philosophers, such as Plato and Aristotle, were possibly classed in a separate "canon.

While the scholars of Alexandria were mainly interested in the verbal criticism of the Greek poets, a wider variety of studies was the characteristic of the school of Pergamum, the literary rival of Alexandria. Pergamum was a home of learning for a large part of the 150 years of the Attalid dynasty, 283-133 B.C.

The grammar of the Stoics, gradually elaborated by Zeno, Cleanthes and Chrysippus, supplied a terminology which, in words such as "genitive," "accusative" and "aorist," has become a permanent part of the grammarians' vocabulary; and the study of this grammar found its earliest home in Pergamum.

From about 168 B.C. the head of the Pergamene school was Crates of Mallus, who (like the Stoics) was an adherent of the principle of "anomaly" in grammar, and was thus opposed to Aristarchus of Alexandria, the champion of "analogy." He also opposed Aristarchus, and supported the Stoics, by insisting on an allegorical interpretation of Homer. He was credited with having drawn up the classified lists of the best authors in the Pergamene library. His mission as an envoy to the Roman senate, "shortly after the death of Ennius," in 169 B.C., had a remarkable influence on literary studies in Rome. Meeting with an accident while he was wandering on the Palatine, and being detained in Rome, he passed part of his enforced leisure in giving lectures (possibly on Homer, his favourite author), and thus succeeded in arousing among the Romans a taste for the scholarly study of literature. The example set by Crates led to the production of a new edition of the epic poem of Naevius, and to the public recitation of the Annals of Ennius, and (two generations later) the Satires of Lucilius.

(iii) The Roman Age.—(a) Latin Studies.—In the 1st century B.C. the foremost scholar in Rome was L. Aelius Stilo (c. 154-150 B.C.), who is described by Cicero as profoundly learned in Greek and Latin literature, and as an accomplished critic of Roman antiquities and of ancient authors. Of the plays then passing under the name of Plautus, he recognized twenty-five as genuine. His most famous pupil was Varro (116-27), the six surviving books of whose great work on the Latin language are mainly concerned with the great grammatical controversy on analogy and anomaly—a controversy which also engaged the attention of Cicero and Caesar, and of the elder Pliny and Quintilian. The twenty-one plays of Plautus accepted by Varro are doubtless the twenty now extant, together with the lost Vidularia. The influence of Varro's last work on the nine disciplinae, or branches of study, long survived in the seven "liberal arts" recognized by St Augustine and Martianus Capella, and in the trivium and quadrivium of the middle ages.

Part of Varro's treatise on Latin was dedicated to Cicero (106-43), who was an interpreter of Greek philosophy to his fellow-countrymen enlarged the vocabulary of Latin by his admirable renderings of Greek philosophical terms, and thus ultimately gave us such indispensable words as "species," "quality" and "quantity."

The earliest of Latin lexicons was produced about 10 B.C. by Varrius Flaccus in a work, De Verborum Significatione, which survived in the abridgment by Festus (2nd century A.D.) and in the further abridgment dedicated by Paulus Diaconus to Charles the Great.

Grammar models were diligently studied by Virgil and Horace. Their own poems soon became the theme of criticism and of comment; and, by the time of Quintilian and Junvenal, they shared the fate (which Horace had feared) of becoming textbooks for use in schools.

Recensions of Terence, Lucretius and Persius, as well as Horace and Virgil, were produced by Probus (d. A.D. 88), with critical symbols resembling those invented by the Alexandrian scholars. His contemporary Asconius is best known as the author of an extant historical commentary on five of the speeches of Cicero. In A.D. 88 Quintilian was placed at the head of the first state-supported school in Rome. His comprehensive work on the training of the future orator includes an outline of general education, which had an important influence on the humanistic schools of the Italian Renaissance. It also presents us with a critical survey of the Greek and Latin classics arranged under the heads of poets, historians, orators and philosophers (book x. chap. i.). The lives of Roman poets and scholars were among the many subjects that exercised the literary skill of Hadrian's private secretary, Suetonius. One of his lost works is the principal source of the erudition of Isidore of Seville (d. A.D. 636), whose comprehensive encyclopaedia was a favourite text-book in the middle ages. About the time of the death of Suetonius (A.D. 160) a work entitled the Notices Atticae was begun by Aulus Gellius. The author is an industrious student and a typical scholar, who frequents libraries and is interested in the MSS. of old Latin authors. Early in the 4th century the study of grammar was represented in northern Africa by the Numidium tiro, Nonius Marcellus (fl. 323), the author of an encyclopaedic work in three parts, lexicographical, grammatical and antiquarian, the main value of which lies in its quotations from early Latin literature. About the middle of the same century grammar had a definite place at Rome in the person of Aelius Donatus, the precursor of St Jerome (d. 374), whose grammar book had remained in use throughout the middle ages. The general state of learning in this century is illustrated by Ausonius (c. 310-393), the grammarian and rhetorician of Bordeaux, the author of the Mosella, and the probable inspirer of the memorable decree of Gratian (376), providing for the appointment and the payment of teachers of rhetoric and of Greek and Latin literature in the principal cities of Gaul. His distinguished friend, Q. Aurelius Symmachus, the consul of A.D. 391, aroused in his own immediate circle an interest in Livy, the whole of whose history was still extant. Early in the 5th century other aristocratic Romans interested themselves in the textual criticism of Persius and Martial. Among the contemporaries of Symmachus, the devoted adherent of the old Roman religion, was St. Jerome (d. 420), the most scholarly representative of Christianity in the 4th century, the student of Plautus and Terence of Virgil and Cicero, the translator of the Chronology of Eusebius, and the author of the Latin version of the Bible now known as the Vulgate. St. Augustine (d. 430) confesses to his early fondness for Virgil, and also tells us that, at Rome in the person of Aelius Donatus, the exponent of the Rhetorica ad Herennium, he began his serious study of grammar. He had to study the "liberal arts," and to examine the "antiquities of Varro and the Republica of Cicero. About the same date, and in the same province of northern Africa, Martianus Capella produced his allegorical work on the "liberal arts," the principal, and, indeed, often the only, text-book of the medieval schools.

In the second half of the 5th century the foremost representative of Latin studies in Gaul was Apollinaris Sidonius (fl. 470), whose Letters were modelled on those of the younger Pliny, while his poems give proof of a wide though superficial acquaintance with classical literature. He laments the increasing decline in the classical purity of the Latin language.

An interest in Latin literature lived longest in Gaul, where schools of learning flourished as early as the 1st century a.D. At Autun, Lyon, Toulouse, Nimes, Vienna, Narbonne and Marseilles; and from the 3rd century onwards, at Trier, Poitiers, Besançon and Bordeaux.

About ten years after the death of Sidonius we find Asterius, the consul of 494, critically revising the text of Virgil in Rome. Boethius, who early in life formed the ambitious plan of expounding and reconciling the opinions of Plato and Aristotle, continued in the year of his sole consulsuphip (510) to instruct his fellow-countrymen in the wisdom of Greece. He is a link between the ancient world and the middle ages, having been the last of the learned Romans who understood the language and studied the
literature of Greece, and the first to interpret to the middle ages the logical treatises of Aristotle. He thereby gave the signal for the age-long conflict between Nominalism and Realism, which exercised the keenest intellects among the Schoolmen, while the crowning work of his life, the Consolatio Philosophica (524), was repeatedly expounded and imitated, and reproduced in renderings that were among the earliest literary products of the vernacular languages of modern Europe. His contemporary, Cassiodorus (c. 480–c. 575), after spending thirty years in the service of the Ostrogothic dynasty at Ravenna, passed the last thirty-three years of his long life on the shores of the Bay of Squillace, where he founded two monasteries and diligently trained his inmates to become careful copyists. In his last work he made extracts for their benefit from the pages of Priscian (fl. 512), a transcript of whose great work on Latin grammar was completed at Constantinople by one of that grammarian’s pupils in 527, to be reproduced in a thousand MSS. in the middle ages. More than ten years before Cassiodorus founded his monasteries in the south of Italy, Benedict of Nursia (480–545) had rendered a more permanent service to the cause of scholarship by building, amid the ruins of the temple of Apollo on the crest of Monte Cassino, the earliest of those homes of learning that have lent an unvarying distinction to the Benedictine order. The learned labours of the Benedictines were no part of the original requirements of the rule of St Benedict; but before the founder’s death his favourite disciple had planted a monastery in France, and the name of that disciple is permanently associated with the learned labours of the Benedictines of the Congregation of St Maur (see MAURISTS).

(b) Greek Studies.—Meanwhile, the study of the Greek classics was ably represented at Rome in the Augustan age by Dionysius of Halicarnassus (fl. 30–8 B.C.), the intelligent critic of the ancient Attic orators, whose 1st century of our era is the probable date of the masterpiece of literary criticism known as the treatise On the Sublime by Longinus (q.v.).

The 2nd century is the age of the two great grammarians, Apollonius Dyscolus (the founder of scientific grammar and the creator of the study of Greek syntax) and his son Herodian, the elder part of whose principal work dealt with the subject of Greek accentuation. It is also the age of the lexicographers of Attic Greek, the most important of whom are Phrynichus, Pollux (fl. a.d. 180) and Harpocrate.

In the 4th century Demosthenes was expounded and imitated by the widely influential teacher, Libanius of Antioch (c. 347–c. 393), the pagan preceptor of St Chrysostom. To the same century we may assign the grammarians Theodotus of Alexandria, who, instead of confining himself (like Dionysius Thrax) to the tenses of τόται in actual use, was the first to set forth all the imaginary aorists and futures of that verb, which have thence descended through the Byzantine age to the grammars of the Renaissance and of modern Europe.

In the 5th century we may place Hesychius of Alexandria, the compiler of the most extensive of our ancient Greek lexicons, and Proclus, the author of a chrestomathy, to the extracts from which (as preserved by Photius) we owe almost all our knowledge of the contents of the lost epics of early Greece. In the same century the study of Plato was represented by Synesius of Cyrene (c. 370–c. 413) and by the Neo-platonists of Alexandria and of Athens. The lower limit of the Roman age of classical studies may be conveniently placed in the year 529. In that year the monastery of Monte Cassino was founded in the West, while the school of Athens was closed in the East. The Roman age thus ends in the West with Boethius, Cassiodorus and St Benedict, and in the East with Priscian and Justinian.

(iii.) The Middle Ages.—(a) In the East, commonly called the Byzantine Age, c. 530–1350. In this age, grammatical learning was represented by Choeroboscus, and lexicography by Photius (d. 891), the patriarch of Constantinople, who is also the author of a Bibliotheca reviewing and critiquing the contents of 280 MSS., and incidentally preserving important extracts from the lost Greek historians.

In the time of Photius the poets usually studied at school were Homer, Hesiod, Pindar; certain select plays of Aeschylus (Prometheus, Sepheus, and Persae); Sophocles (Ajax, Electra and Oedipus Tyrannus), and Euripides (Hecuba, Orcestis, Phoenissae, and, next to these, Alcestis, Andromache, Hylas, Medea, Rheus, Troades,) also Aristophanes (beginning with the Plutus), Theocritus, Lycophron, and Dionysius Periegetes. The principal prose authors were Thucydides, parts of Plato and Demosthenes, with Aristote, Plutarch’s Lives, and, above all, Lucian, who is often imitated in the Byzantine age.

One of the distinguished pupils of Photius, Arethas, bishop of Caesarea in Cappadocia (c. 907–932), devised himself with remarkable energy to collecting and expounding the Greek classics. Among the important MSS. still extant that were copied at his expense are the Bodleian Euclid (888) and the Bodleian Plato (893). To the third quarter of the 10th century we may assign the Greek lexicon of Suidas, a combination of a lexicon and an encyclopaedia, the best articles being those on the history of literature.

Meanwhile, during the “dark age” of secular learning at Constantinople (641–850), the light of Greek learning had spread eastwards to Syria and the East. At Baghdad, in the reign of Mamun (813–833), the son of Harun, ‘a great and philosophical works were translated by Syrian Christians from Syriac into Arabic. It was in his reign that Aristotle was first translated into Arabic, and, shortly afterwards, we have Syriac and Arabic renderings of commentators on Aristotle, and of portions of Plato, Hippocrates and Galen; while in the 10th century new translations of Aristotle and his commentators were produced by the Nestorian Christians.

The Arabic translations of Aristotle passed from the East to the West by being transmitted through the Arab dominions in northern Africa to Spain, which had been conquered by the Arabs in the 8th century. In the 12th century Toledo was the centre of the study of Aristotle in the West, and it was from Toledo that the knowledge of Aristotle spread to Paris and to other seats of learning in western Europe.

The 12th century in Constantinople is marked by the name of Tzetzes (c. 895), the author of a mythological, literary and historical miscellany called the Chilias, in the course of which he quotes more than four hundred authors. The prolegomena to his scholia on Aristophanes supply us with valuable information on the Alexandrian libraries. The most memorable name, however, among the scholars of this century is that of Eustathius, whose philological studies at Constantinople preceded his tenure of the archbishopric of Thessalonica (1175–1192). The opening pages of his commentaries on the Iliad and the Odyssey dwell with enthusiasm on the abiding influence of Homer on the literature of Greece.

While the Byzantine MSS. of the 11th century (such as the Laurentian MSS. of Aeschylos and Sophocles, and the Ravenna MS. of Aristophanes) maintain the sound traditions of the Alexandrian and Roman ages, those of the times of the Palaeologoi give proof of a frequent tampering with the metres of the ancient poets in order to bring them into conformity with theories recently invented by Moschopulus and Triclinius. The scholars of this time are the immediate predecessors of the earliest representatives of the Revival of Learning in the West. One of these later Byzantines the first in order of date is the monk Planudes (d. 1350), who devoted his knowledge of Latin to producing excellent translations of Caesar’s Gallic War as well as Ovid’s Metamorphoses and Heroides, and the classic work of Boethius; he also compiled (in 1302) the only Greek anthology known to scholars before the recovery in 1607 of the earlier and fuller anthology of Cephalas (fl. 917).

The scholars of the Byzantine age cannot be compared with the great Alexandrians, but they served to maintain the continuity of tradition by which the Greek classics selected by the critics of Alexandria were transmitted to modern Europe.

(b) In the West (c. 530–c. 1350).—At the portal of the middle ages stands Gregory the Great (c. 540–604), who had little (if any) knowledge of Greek and had no sympathy with the secular
side of the study of Latin. A decline in grammatical learning is exemplified in the three Latin historians of the 6th century, Jordanes, Gildas and Gregory of Tours (d. 594), who begins his history of the Franks by lamenting the decay of Latin literature in Gaul. The historian of Tours befriended the Latin poet, Venantius Fortunatus (d. c. 600), who is still remembered as the writer of the three well-known hymns beginning Salve festa dies, Vexilla regis prodeunt, and Pange lingua gloriosi proelium ceraminis. The decadence of Latin early in the 7th century is exemplified by the fantastic grammarian Virgilius Maro, who also illustrates the transition from Latin to Provençal, and from quantitative to accentual forms of verse.

While Latin was declining in Gaul, even Greek was not unknown in Ireland, and the Irish passion for travel led to the spread of Greek learning in the west of Europe. The Irish monk Columban, shortly before his death in 615, founded in the neighbourhood of Pavia the monastery of Bobbio, to be the repository of many Latin MSS. which were ultimately dispersed among the libraries of Rome, Milan and Turin. About the same date his fellow-traveller, Gallus, founded above the Lake of Constance the monastery of St Gallen, where Latin MSS. were preserved until their recovery in the age of the Renaissance. During the next twenty-five years Isidore of Seville (d. 636) produced in his Origines an encyclopaedic work which gathered up for the middle ages much of the learning of the ancient world.

In Italy a decline in the knowledge of Greek in the 6th and 7th centuries led to an estrangement between the Greek and Latin Churches. The year 690 is regarded as the date of the temporary extinction of Greek in Italy, but, in the first quarters of the 8th and the 9th centuries, the iconoclastic decrees of the Byzantine emperors drove many of the Greek monks and their lay adherents to the south of Italy, and even to Rome itself. In Ireland we find Greek characters used in the Book of Armagh (c. 807); and, in the same century, a Greek psalter was copied by an Irish monk, Stigand of Lichfield (d. 858). The harder task of knowledge of Latin literature. In England, sixty years after the death of Augustine, the Greek archbishop of Canterbury, Theodore of Tarsus (d. 690) founded a school for the study of Greek, and with the help of an African monk named Hadrian made many of the English monasteries schools of Greek, and Latin learning, so that, in the time of Bede (d. 735), some of the scholars who still survived were "as familiar with Greek and Latin as with their mother-tongue." Among those who had learned their Greek at Canterbury was Aldhelm (d. 709), "the first Englishman who cultivated classical learning with any success." While Aldhelm is known as "the father of Anglo-Latin verse," Latin prose was the literary medium used by Bede in his celebrated Ecclesiastical History of England (731). Nine years after the death of Bede (735), Boniface, "the apostle of Germany," sanctioned the founding of Fulda (744), which soon rivalled St Gallen as a school of learning. Alcuin (d. 804), who was probably born in the year of Bede's death, tells us of the wealth of Latin literature preserved in the library at York. Through the invitation of Charles the Great, he became associated with the revival of learning which marks the reign of that monarch, by presiding over the School of the Palace (782–790), and by exercising a healthy influence as abbot of St Martin's at Tours (796–804). Among the friends of Alcuin and the advisers of Charles was Theodulfus, bishop of Orleans and abbot of Fleury (d. 821), who is memorable as an accomplished Latin poet, and as the initiator of free education. Einhard (d. 840), in his classic life of Charles the Great, models his style on that of Suetonius, and shows his familiarity with Caesar and Livy and Cicero, while Rabanus Maurus (d. 856), who long presided over Einhard's school of Fulda, was the first to introduce Priscian into the schools of Germany. His pupil, Walafrid Strabo, the abbot of Reichenau (d. 849), had a genuine gift for Latin poetry, a gift agreeably exemplified in his poem on the plants in the monastic garden. If the 6th century was an age of interest in the Latin classics, he is a precursor of the humanists of the Renaissance. Under Charles the Bald (d. 877) there was a certain revival of interest in literature, when John the Scot (Erigena) became, for some thirty years (c. 845–875), the head of the Palace School. He was familiar with the Greek fathers, and was chosen to execute a Latin rendering of the writings of "Dionysius the Areopagite," the patron saint of France. In the preface the translator praises the king for prompting him not to rest satisfied with the literature of the West, but to have recourse to the "most pure and copious waters of the Greeks." In the next generation Remi of Auxerre was the first to open a school in Paris (900). Virgil is the main authority quoted in Remi's Commentary on Donatus, which remained in use until the Renaissance. During the two centuries after John the Scot, the study of Greek declined in France. In England the 9th century closes with Alfred, who, with the aid of the Welsh monk, Asser, produced a series of free translations from Latin texts, including Boethius and Orosius and Bede, and the Curia Pastoralis of Gregory the Great.

In the 10th century learning flourished at Aachen under Bruno, brother of Otto I. and archbishop of Cologne (953–965), who had himself learned Greek from certain Eastern monks at the imperial court, and who called an Irish bishop from Trier to teach Greek at the imperial capital. He also encouraged the transcription of Latin MSS., which became models of style to Widukind of Corvey, the imitator of Sallust and Livy. In the same century the monastery of Gandersheim, south of Hanover, was the retreat of the learned nun Hrotswita, who celebrated the exploits of Otho in leonine hexameters, and composed in prose six moral and religious plays in imitation of Terence. One of the most prominent personages of the century was Gerbert of Aurillac, who, after teaching at Tours and Fleury, became abbot of Bobbio, archbishop of Reims, and ultimately pope under the name of Silvester II. (d. 1003). He frequently quotes from the speeches of Cicero, and it has been surmised that the survival of school specimens of his work due to the influence of Gerbert. The most original hellenist of this age was Luitprand of Cremona (d. 972), who acquired some knowledge of Greek during his repeated missions to Constantinople. About the same time in England Oswald of York, who had himself been educated at Fleury, invited Abbo (d. 1004) to instruct the monks of the abbey recently founded at Ramsey, near Huntingdon. At Ramsey he wrote for his pupils a scholarly work dealing with points of prosody and pronunciation, and exhibiting an accurate knowledge of Virgil and Horace. During the same half-century, Ellfric, the abbot of Eynsham (d. c. 1030), aided Bishop Æthelwold in making Winchester famous as a place of education. It was there that he began his Latin Grammar, his Glossary (the earliest Latin–English dictionary in existence), and his Colloquium, in which Latin is taught in a conversational manner.

In France, the most notable teacher in the first quarter of the 11th century was Fulbert, bishop of Chartres (d. 1029). In and after the middle of that century the Norman monastery of Bec flourished under the rule of Lanfranc and Anselm, both of whom had begun their career in northern Italy, and closed it at Canterbury. Meanwhile, in Germany, the styles of Sallust and Livy were being happily imitated in the Annales of Lambeth of Hersfeld (d. 1077). In Italy, where the study of Latin literature seems never to have entirely died out, young nobles and students preparing for the priesthood were not infrequently learning Latin together, in private grammar schools under liberal clerics, such as Anselm of Biscate (fl. 1050), who describes himself as divided in his allegiance between the saints and the muses. Learning flourished at Monte Cassino under the rule of the Abbot Desiderius (afterwards Pope Victor III.). In this century that famous monastery had its classical chronicler in Leo Marsicanus, and its Latin poet in Alfanus, the future archbishop of Salerno.

The Schoolmen devoted most of their attention to Aristotle, and we may here briefly note the successive stages in their gradually increasing knowledge of his works. Until 11th or the first two of the five parts of the Organon were known, and those solely in Latin translations from the original. After that date two more became known; the whole was familiar to John...
of Salisbury in 1159; while the *Physics* and *Metaphysics* came into notice about 1200. Plato was mainly represented by the Latin translation of the *Timaeus*. Abelard (d. 1142) was acquainted with no Greek works except in Latin translations, but he has left his mark on the history of European education. The wide popularity of his brilliant lectures in the "schools" of Paris made this the resort of the many students who were ultimately organized as a "university" (c. 1170). John of Salisbury attended Abelard's lectures in 1136, and, after spending two years in the study of logic in Paris, passed three more in the scholarly study of Latin literature at Chartres, where a sound and healthy tradition, originally due to Bernard of Chartres (d. 1120), was still perpetuated by his pupils. In that school the study of "figures of speech" was treated as merely introductory to that of the classical texts. Stress was laid on the sense as well as the style of the author studied. Discussions on set subjects were held, select passages from the classics learned by heart, while written exercises in prose and verse were founded on the best ancient models. In the general scheme of education the authority followed was Quintilian. John of Salisbury (d. 1180), the ripest product of this school, is the most learned man of his time. His favourite author is Cicero, and in all the Latin literature accessible to him he is the best-read scholar of his age. Among Latin scholars of the next generation we have Gualdras Cambrensis (d. c. 1222), the author of topographical and historical writings on Ireland and Wales, and of other works teeming with quotations from the Latin classics. During the middle ages Latin prose never dies out. It is the normal language of literature. In England it is used by many chroniclers and historians, the best known of whom are William of Malmesbury (d. 1142) and Matthew Paris (d. 1250). In Italy Latin verse had been felicitously applied to historic themes by William of Apulia (fl. 1100) and other Latin poets (1085-1247). In the 12th century England claims at least seven Latin poets, one of these being her only Latin epic poet, Joseph of Exeter (d. 1210), whose poem on the Trojan war is still extant. The Latin versifier, John of Garlandia, an Englishman who lived mainly in France (fl. 1204-1252), produced several Latin vocabularies which were still in use by the schoolboys of Erasmus. The Latin poets of French birth include Gautier and Alain de Lille (d. c. 1203), the former being the author of the *Alexandres*, and the latter that of the *Anti-Claudianus*, a poem familiar to Chaucer.

During the hundred and thirty years that elapsed between the early translations of Aristotle executed at Toledo about 1150 and the death in 1281 of William of Moerbeke, the translator of the *Rhetoric* and the *Politics*, the knowledge of Aristotle had been greatly extended in Europe by means of translations, first from the Arabic, and, next, from the original Greek. Aristotle had been studied in England by Grosseteste (d. 1253), and expounded abroad by the great Dominican, Albertus Magnus (d. 1280), and his famous pupil, Thomas Aquinas (d. 1274). Among the keenest critics of the Schoolmen and of the recent translations of Aristotle was Roger Bacon (d. 1294), whose *Opus majus* has been recognized as the *Encyclopaedia* and the *Organon* of the 13th century. His knowledge of Greek, as shown in his *Greek Grammar* (first published in 1902), was clearly derived from the Greeks of his own day. The medieval dependence on the authority of Aristotle gradually diminished. This was partly due to the recovery of some of the lost works of ancient literature, and the transition from the middle ages to the revival of learning was attended by a general widening of the range of classical studies and by a renewed interest in Plato.

The classical learning of the middle ages was largely second-hand. It was often derived from glossaries, from books of elegant extracts, or from comprehensive encyclopedias. Among the compilers of these last were Isidore and Hrabanus, William of Conches and Honorius of Autun, Bartholomaeus Anglicus (fl. 1250), Vincent of Beauvais (d. 1264), and, lastly, Brunetto Latini (d. 1290), the earlier contemporary of Dante. For Aristotle, as interpreted by Albertus Magnus and Thomas Aquinas, Dante has the highest regard. To the Latin translations of Aristotle and to his interpreters he refers in more than three hundred passages, while the number of his references to the Latin translation of the *Timaeus* of Plato is less than ten. His five great pagan poets are Homer, Virgil, Horace, Ovid, Lucan; Statius he regards as a "Christian" converted by Virgil's *Fourth Eclogue*. His standard authors in Latin prose are Cicero, Livy, Pliny, Frontinus and Orosius. His knowledge of Greek was practically nil. Latin was the language of his political treatise, *De Monarchia*, and even that of his defence of the vulgar tongue, *De Vulgari Eloquio*. He is, in a limited sense, a precursor of the Renaissance, but he is far more truly to be regarded as the crowning representative of the spirit of the middle ages.

(iv.) The Modern Age.—(a) Our fourth period is ushered in by the age of the Revival of Learning in Italy (c. 1350-1527). Petrarch (1304-1374) has been well described as "the first of modern men." In contrast with the Schoolmen of the middle ages, he has no partiality for Aristotle. He was interested in Greek, and, a full century before the fall of Constantinople, he was in possession of MSS. of Homer and Plato, though his knowledge of the language was limited to the barest rudiments. For that knowledge, scanty as it was, he was indebted to Leontius Pilatus, with whose aid Boccaccio (1315-1375) became "the first of modern men" to study Greek to some purpose during the three years that Leontius spent as his guest in Florence (1360-1363). It was also at Florence that Greek was taught in the next generation by Chrysoloras (in 1396-1400). Another generation passed, and the scholars of the East and West met at the council of Florence (1439) One of the envoys of the Greeks, Gemistus Pletho, then inspired Cosimo dei Medici with the thought of founding an academy for the study of Plato. The academy was founded, and, in the age of Lorenzo, Plato and Plotinus were translated into Latin by Marsilio Ficino (d. 1499). The *Apology* and *Crito*, the *Phaedo*, *Phaedrus*, and *Gorgias* of Plato, as well as speeches of Demosthenes and Aeschines, with the *Oeconomics*, *Ethics* and *Politics* of Aristotle, had already been translated by Leonardo Bruni (d. 1444); the *Rhetoric* by Filelfo (1430), and Plato's *Republic* by Decembrio (1439). A comprehensive scheme for translating the principal Greek prose authors into Latin was carried out at Rome by the founder of the manuscript collections of the Vatican, Nicholas V. (1447-1455), who had belonged to the literary circle of Cosimo at Florence. The translation of Aristotle was entrusted to three of the learned Greeks who had already arrived in Italy, Trazapontius, Gaza and Bessarion, while other authors were undertaken by Italian scholars such as Guarino, Valla, Decembrio and Perotti. Among the scholars of Italian birth, probably the only one in this age who rivalled the Greeks as a public expositor of their own literature was Politian (1454-1504), who lectured on Homer and Aristotle in Florence, translated Herodotus, and was specially interested in the Latin authors of the Silver Age and in the text of the *Pandects* of Justinian. It will be observed that the study of Greek had been resumed in Florence half a century before the fall of Constantinople, and that the principal works of Greek prose had been translated into Latin before that event.

Meanwhile, the quest of MSS. of the Latin classics had been actively pursued. Petrarch had discovered Cicero's Speech *pro Archia* at Liége (1333) and the *Letters to Atticus* and *Quintus* at Verona (1345). Boccaccio had discovered Martial and Ausonius, and had been the first of the humanists to be familiar with Varro and Tacitus, while Salutati had recovered Cicero's letters *Ad Familiares* (1389). During the council of Constance, Poggio, the papal secretary, spent in the quest of MSS. the interval between May 1415 and November 1417, during which he was left at leisure by the vacancy in the apostolic see.

Thirteen of Cicero's speeches were found by him at Cluny and Langres, and elsewhere in France or Germany; the commentary of Asconius, a complete Quintilian, and a large part of Valerius Flaccus were discovered at St Gallen. A second expedition to that monastery and to others in the neighbourhood led to the recovery of Lucretius, Manilius, Silicus Italicus and Ammianus.
Marcellinus, while the Siloe of Statius were recovered shortly afterwards. A complete MS of Cicero, De Oratore, Brutus and Orator, was found by Bishop Landrani at Lod (1421). Cornelius Nepos was discovered by Traversari in Padua (1434). The Agiolo, Germania and Dialogue of Tacitus reached Italy from Germany in 1455, and the early books of the Annals in 1508. P帘y's Panegyric was discovered by Aurispa at Mainz (1433), and his correspondence with Trajan by Fra Giocondo in Paris about 1500.

Greek MSS were brought from the East by Aurispa, who in 1423 returned with no less than two hundred and thirty-eight, including the celebrated Laurentian MS of Aeschylus, Sophocles and Apollonius Rhodius. A smaller number was brought from Constantinople by Filelfo (1427), while Quintus Smyrnaeus was discovered in south Italy by Bessarion, who presented his own collection of MSS to the republic of Venice and thus led to the foundation of the library of St Mark's (1468). As the emissary of Lorenzo, Janus Lascaris paid two visits to the East, returning from his second visit in 1492 with two hundred MSS from Mount Athos.

The Renaissance theory of a humanistic education is illustrated by several treatises still extant. In 1592 Vergere addressed to the first treatise which methodically maintains the claims of Latin as an essential part of a liberal education. Eight years later, he was learning Greek from Chrysoloras. Among the most distinguished pupils of the latter was Leonardo Bruni, who, about 1405, wrote "the earliest humanistic tract on education expressly addressed to a lady." He here urges that the foundation of all true learning is "a sound and thorough knowledge of Latin," and draws up a course of reading, in which history is represented by Livy, Sallust, Curtius, and Caesar; oratory by Cicero; and poetry by Virgil. The same year saw the birth of Maffeo Vegio, whose early reverence for the muse of Virgil and whose later devotion to the memory of Monica had left their mark on the educational treatise which he wrote a few years before his death in 1458. The authors he recommends include "Aesop" and Sallust, the tragedies of Seneca and the epic poets, especially Virgil, whom he interprets in an allegorical sense. He is in favour of an early simultaneous study of a wide variety of subjects, to be followed later by the special study of one or two. Eight years before the death of Vegio, the Sylvis Piconolius (Pius II.) had composed a brief treatise on education in the form of a letter to Ladislaus, the young king of Bohemia and Hungary. The Latin poets to be studied include Virgil, Lucan, Statius, Ovid's Metamorphoses, and (with certain limitations) Horace, Juvenal and Persius, as well as Plautus, Terence and the tragedies of Seneca; the prose authors recommended are Cicero, Livy and Sallust. The first great school of the Renaissance was that established by Vittorino da Feltre at Mantua, where he resided for the last twenty-two years of his life (1424-1446). Among the Latin authors studied were Virgil and Lucan, with selections from Horace, Ovid and Juvenal, besides Cicero and Quintilian, Sallust and Curtius, Caesar and Livy. The Greek authors were Homer, Hesiod, Pindar and the dramatists, with Herodotus, Xenophon and Plato, Isocrates and Demosthenes, Plutarch and Arrian.

Meanwhile, Guarino had been devoting five years to the training of the eldest son of the marquis of Ferrara. At Ferrara he spent the last thirty years of his long life (1370-1460), producing textbooks of Greek and Latin grammar, and translations from Snellius and Plutarch. His method may be gathered from his son's treatise, De Ordine Docendi et Studendi. In that treatise the essential marks of an educated person are, not only ability to write Latin verse, but also, a point of "at least equal importance," "familiarity with the language and literature of Greece." "Without a knowledge of Greek, Latin scholarship itself is, in any real sense, impossible" (1450).

By the fall of Constantinople in 1453, "Italy (in the eloquent phrase of Carducci) became sole heir and guardian of the ancient civilization," but its fall was in no way necessary for the revival of learning, which had begun a century before. Bessarion, Theodorus Gaza, Georgius Trepezuntius, Argypolus, Chal- condyles, all had reached Italy before 1453. A few more Greeks fled to Italy after that date, and among these were Janus Lascaris, Murusus and Calligees. All three were of signal service in devoting their knowledge of Greek to perpetuating and popularizing the Greek classics with the aid of the newly-invented art of printing. That art had been introduced into Italy by the German printers, Sweynheym and Pannartz, who had worked under Fust at Mainz. At Subiaco and at Rome they had produced in 1465-1471 the earliest editions of Cicero, De Oratore and the Letters, and eight other Latin authors.

The printing of Greek began at Milan with the Greek grammar of Constantine Lascaris (1476). At Florence the earliest editions of Homer (1488) and Isocrates (1493) had been produced by Demetrius Chalcondyles, while Janus Lascaris was the first to edit the Greek anthology, Apollonius Rhodius, and parts of Euripides, Callimachus and Lucian (1494-1496). In 1494-1515 Aldus Manutius published at Venice no less than twenty-seven editiones princeps of Greek authors and of Greek works of reference, the authors including Aristotle, Theophrastus, Theocritus, Aristophanes, Thucydides, Sophocles, Herodotus, Euripides, Demosthenes (and the minor Attic orators), Pindar, Theocritus, Sallust, Livy, etc. The scholar-printer was largely aided by Musurus, who also edited the Aldine Pausianias (1516) and the Elymologicum printed in Venice by another Greek immigrant, Calligees (1499).

The Revival of Learning in Italy ends with the sack of Rome (1527). Before 1525 the study of Greek had begun to decline in Italy, but meanwhile an interest in that language had been transmitted to the lands beyond the Alps.

In the study of Latin the principal aim of the Italian humanists was the imitation of the style of their classical models. In the case of poetry, this imitative spirit is apparent in Petrarch's Africa, and in the Latin poems of Politian, Pontano, Sannazaro, Vida and many others. Petrarch was not only the imitator of Virgil, who had been the leading name in Latin letters throughout the middle ages; it was the influence of Petrarch that gave a new prominence to Cicero. The imitation of Cicero was carried on with varying degrees of success by humanists such as Gasparino da Barzizza (d. 1451), who introduced a new style of rhetoric into Latin by his Discorsi, and discussed the importance of a rhetorical structure in the composition of Ciceronian prose (1496); and by the accomplished secretaries of Leo X., Beno and Sadoletto. Both of these papal secretaries were mentioned in complimentary terms by Erasmus in his celebrated dialogue, the Ciceronianus (1528), in which no less than one hundred and six Ciceronian scholars of all nations are briefly and brilliantly reviewed, the slavish imitation of Cicero denounced, and the law laid down that "to speak with propriety we must adapt ourselves to the age in which we live—an age that differs entirely from that of Cicero." One of the younger Ciceronianists criticized by Erasmus was Longolius, who had died at Padua in 1532. The case of the Ciceronianists was defended by the elder Scaliger in 1531 and 1536, and by Etienne Dolet in 1555, and the controversy was continued by other scholars down to the year 1610. Meanwhile, in Italy, a strict type of Ciceronianism was represented by Paulus Manutius (d. 1574), and a freer and more original form of Latinity by Marcello (d. 1585).

Before touching on the salient points in the subsequent centuries, in connexion with the leading nations of Europe, we may briefly note the cosmopolitan position of Erasmus (1466-1536), who, although he was a native of the Netherlands, was far more closely connected with France, England, Italy, Germany and Switzerland, than with the land of his birth. He was still a school-boy at Deventer when his high promise was recognized by Rudolf Agricola, "the first (says Erasmus) who brought from Italy some breath of a better culture." Late in 1549 Erasmus spent some two months at Oxford, where he met Colet; it was in London that he met More and Linacre and Grocyn, who had already ceased to lecture at Oxford. At Paris, in 1500, he was fully conscious that "without Greek the ampest
knowledge of Latin was imperfect”

In France the most effective of the early teachers of Greek was Janus Lascaris (1495–1503). Among his occasional pupils was Budaues (d. 1540), who prompted Francis I. to found in 1539 the incorporation of the Royal Society of Letters in Greek, as well as Latin, under the name of the Collège de France. In the study of Greek one of the earliest links between Italy and Germany was Rudolf Agricola, who had learned Greek under Gaza at Ferrara. It was in Paris that his younger contemporary Reuchlin acquired part of that proficiency in Greek which attracted the notice of Argyropulus, whose admiration of Reuchlin is twice recorded by Melanchthon, who soon afterwards was pre-eminent as the “praeceptor” of Germany.

In the age of the revival the first Englishman who studied Greek was a Benedictine monk, William of Selling (d. 1494), who paid two visits to Italy. At Canterbury he inspired with his own love of learning his nephew, Linacre, who joined him on one of those visits, studied Greek at Florence under Politian and Chalcondyles, and apparently stayed in Italy from 1485 to 1499. His translation of a treatise of Galen was printed at Cambridge in 1521 by Sibber, who, in the same year and place, was the first to use Greek type in England. Greek had been first taught to some purpose at Oxford by Grocyn on his return from Italy in 1491. One of the younger scholars of the day was William Llyve, who picked up his Greek as Rhodes on his way to Palestine and became the first high-master of the school founded by Colet at St Paul’s (1510).

(b) That part of the Modern Period of classical studies which succeeds the age of the Revival in Italy may be subdivided into three periods distinguished by the names of the nations most prominent in each.

1. The French period. It begins with the foundation of the Royal Readers by Francis I. in 1530, and it may perhaps be regarded as extending to 1700.

This period is marked by a many-sided erudition rather than by any special cult of the form of the classical languages. It is the period of the great polyhistors of France. It includes Budaues and the elder Scaliger, who settled in France in 1520, with Turnebus and Laminbus, and the learned printers Robertus and Henricus Stephanus, while among its foremost names are those of the younger (and greater) Scaliger, Casaubon and Salmusius. Of these, Casaubon ended his days in England (1614); Scaliger, by leaving France for the Netherlands in 1533, for a time at least transferred the supremacy in scholarship from the land of his birth to that of his adoption. The last sixteen years of his life (1593–1609) were spent at Leiden, which was also for more than twenty years (1631–1653) the home of Salmusius, and for thirteen (1579–1592) that of Lipsius (d.1606). In the 17th century the erudition of France is best represented by “Henricus Valesius,” Du Cange and Mabillon. In the same period Italy was represented by Muretus, who had left France in 1563, and by her own sons, Nizolius, Victorius, Bobetell and Sigonius, followed in the 17th century by R. Fabretti. The Netherlands, in the 17th, claim W. Canter as well as Lipsius, and, in the 17th, G. J. Vossius, Johannes Meursius, the elder and younger Heinssius, Hugo Grotius, J. F. Gronovius, J. G. Graevius and P. Perizonius. Scotland, in the 16th, is represented by George Buchanan; England by Sir John Cheke, Roger Ascham, and Sir Henry Savile, and, in the 17th, by Thomas Gataker, Thomas Stanley, Henry Dodwell, and Joshua Barnes; Germany by Janus Gruter, Ezechiel Spanheim and Chr. Cellarius, the first two of which were also connected with other countries.

We have already seen that a strict imitation of Cicero was one of the characteristics of the Italian humanists. In and after the middle of the 16th century a correct and pure Latinity was promoted by the educational system of the Jesuits; but with the growth of the vernacular literatures Latin became more and more exclusively the language of the learned. Among the most conspicuous Latin writers of the 17th century are G. J. Vossius and the Heinssius, with Salmusius and his great adversary, Milton. Latin was also used in works on science and philosophy, such as Sir Isaac Newton’s Principia (1687), and many of the works of Leibniz (1646–1716). In botany the custom followed by John Ray (1627–1705) in his Historia Plantarum and in other works was continued in 1760 by Linnaeus in his Systema Naturae. The last important work in English theology written in Latin was George Bull’s Defensio Fidei Nicensae (1683). The use of Latin in diplomacy died out towards the end of the 17th century; but, long after that date negotiations with the German empire were conducted in Latin, and Latin was the language of the debates in the Hungarian diet down to 1825.

2. During the 18th century the classical scholarship of the Netherlands was under the healthy and stimulating influence of Bentley (1662–1742), who marks the beginning of the English and Dutch period, mainly represented in Holland by Bentley’s younger contemporary and correspondent, Tiberius Hemsterhuyys (1653–1706), and the latter scholar’s great pupil David Ruhnken (1723–1798). It is the age of historical and literary, as well as verbal, criticism. Both of these were ably represented in the first half of the century by Bentley himself, while, in the twenty years between 1739 and 1803, the verbal criticism of the tragic poets of Athens was the peculiar province of Richard Porson (1759–1808), who was in the same year as P. A. Wolf. Among other representatives of England were Jeremiah Markland and Jonathan Toup, Thomas Tyrwhitt and Thomas Tying, Samuel Parr and Sir William Jones; and of the Netherlands, the two Burmanns and L. Kuster, Arnold Drakenborch and Wesseling, Lodewyk Valckenier and Daniel Wytenbach (1746–1829). Germany is represented by Fabricius and J. M. Gesner, J. A. Ernesti and J. J. Reiske, J. Winkelmann and Chr. G. Heyne; France by B. de Montfaucon and J. B. G. Dilloison; Alsace by French subjects of German origin, R. F. Bruncan and J. Schweghauer; and Italy by E. Forcellini and Ed. Corsini.

3. The German period begins with F. A. Wolf (1759–1824), whose Prolegomena to Homer appeared in 1795. He is the founder of the systematic and encyclopaedic type of scholarship embodied in the comprehensive term Alteritumswissenschaft, or “a scientific knowledge of the old classical world.” The tradition of Wolf was ably continued by August Böckh (d. 1867), one of the leaders of the historical and antiquarian school, brilliantly represented in the previous generation by B. G. Niebuhr (d. 1831).

In contrast with this school we have the critical and grammatical school of Gottfried Hermann (d. 1848). During this period, while Germany remains the most productive of the nations, scholarship has been more and more international and cosmopolitan in its character.

19th Century.—We must here be content with simply recording the names of a few of the more prominent representatives of

The 10th century in Germany was marked by the organization of the great series of Greek and Latin inscriptions, and by the foundation of the Archaeological Institute in Rome (1829), which was at first international in its character. The Athenian Institute was founded in 1874. Schools at Athens and Rome were founded by France in 1825 and 1873, by the United States of America in 1882 and 1895, and by England in 1878 and 1901; and periodicals are published by the schools of all these four nations. An interest in Greek studies (and especially in art and archaeology) has been maintained in England by the Hellenic Society, founded in 1879, with its organ the Journal of Hellenic Studies. A further interest in Greek archaeology has been awakened in all civilized lands by the excavations of Troy, Mycenae, Tiryns, Epidaurus, Sparta, Olympia, Dodona, Delphi, Delos and of important sites in Crete. The extensive discoveries of papyri in Egypt have greatly extended our knowledge of the administration of that country in the times of the Ptolemies, and have materially added to the existing remains of Greek literature. Scholars have been enabled to realize in their own experience some of the enthusiasm that attended the recovery of lost classics during the Revival of Learning. They have found themselves living in a new age of editions principes, and have eagerly welcomed the first publication of Aristotle's Constitution of Athens (1891), Herondas (1891) and Bacchylides (1897), as well as the Persicae of Timotheus of Miletus (1903), with some other works of Pindar (1907) and other epistles of Menander (1907).

The first four of these were first edited by F. G. Kenyon, Timotheus by van Wilamowitz-Möllendorff, Menander partly by J. Nicole and G. Lefebre and partly by B. P. Grenfell and A. S. Hunt, who have also produced fragments of the Paean of Pindar and many other classical texts (including a Greek continuation of Thucydides and a Latin epitome of part of Livy) in the successive volumes of the Oxyrhynchus papyri and other kindred publications.

AUTHORITIES.—For a full bibliography of the history of classical philology, see E. Hübner, Grundriss zu Vorlesungen über Geschichte und Enciclopaedia der klassischen Philologie (2nd ed., 1889); and for a bibliography of C. F. G. P. Talman, Les Histoires d'Egypte (2 vols., 1889-1891; and nouvelle tirage 1907), and other authors.

THE STUDY OF THE CLASSES IN SECONDARY EDUCATION

After the Revival of Learning the study of the classics owed much to the influence and example of Vittorino da Feltre, Budaeeus, Erasmus and Melanchthon, who were among the leading representatives of that revival in Italy, France, England and Germany.

1. In England, the two great schools of Winchester (1382) and Eton (1440) had been founded during the life of Vittorino, but before the revival had reached Britain. The first school which came into being under the immediate influence of humanism was that founded at St Paul's by Dean

1 See also the article Schools.
Colet (1510), the friend of Erasmus, whose treatise De pu eris institutae (1529) has its English counterpart in the "Governor of Sir Thomas Elyot (1531). The highmaster of St. Paul's was to be "learned in good and clean Latin, and also in Greek, if such may be gotten." The master and the second master of Shrewsbury (founded 1551) were to be "well able to make a Latin verse, and learned in the Greek tongue." The influence of the revival extended to many other schools, such as Christ's Hospital (1552), Westminster (1560), and Merchant Taylors' (1601); Repton (1557), Rugby (1567) and Harrow (1571).

At the grammar school of Stratford-on-Avon, about 1571-1577, Shakespeare presumably studied Terence, Horace, Ovid, and the Bucolics of Baptist Mantuanus (1502). In the early plays he quotes Ovid and Seneca. Similarly, in Titus Andronicus (iv. 2) he says, of Integer vitae: "'Tis a verse in Horace; I know it well: I read it in the grammar long ago." In Henry VI. part ii. sc. 7, when Jack Cade charges Lord Say with having "most traitorously corrupted the youth of the realm in erecting a grammar-school," Lord Say replies that "ignorance is the curse of God, knowledge the wing with which we fly to heaven." In the Taming of the Shrew (i. 157) a line is quoted as from Terence (Andria, 74): "redme te captum quam quaeas minimam." This is taken verbatim from Lilye's contribution to the Breviis Institutione, originally composed by Colet, Erasmus and Lilye for St. Paul's School (1527), and ultimately adopted as the Early text-books.

Eton Latin Grammar. The Westminster Greek Grammar of Grant (1575) was succeeded by that of Camden (1595), founded mainly on a Paduan text-book, and apparently adopted in 1596 by Sir Henry Savile at Eton, where it long remained in use as the Eton Greek Grammar, while at Westminister it was superseded by that of Busby (1663). The text-books to be used at Harrow in 1590 included Hesiod and some of the Greek orators and historians.

In one of the Paston Letters (i. 301), an Eton boy of 1466 quotes two Latin verses of his own composition. Nearly a century later, on New Year's Day, 1560, forty-four boys of the school presented Latin verses to Queen Elizabeth. The queen's former tutor, Roger Ascham, in his Scholemaster (1570), agrees with his Strassburg friend, J. Sturm, in making the imitation of the Latin classics the main aim of instruction. He is more original when he insists on the value of translation and retranslation for acquiring a mastery over Latin prose composition, and when he protests against compelling boys to converse in Latin too soon. Ascham's influence is apparent in the Positions of Mulcaster, who in 1581 insists on instruction in English before admission to a grammar-school, while he is distinctly in advance of his age in urging the foundation of a special college for the training of teachers.

Cleland's Institution of a Young Nobleman (1607) owes much to the Italian humanists. The author follows Ascham in protesting against compulsory Latin conversation, and only slightly modifies his predecessor's method of teaching Latin prose. When Latin grammar has been mastered, he bids the teacher lead his pupil "into the sweet fountain and spring of all Arts and Science," that is, Greek learning which is "as profitable for the understanding as the Latin tongue for speaking." In the study of ancient history, "deeds not words" are the prime interest. "In Plutarch pleasure is so mixed and confounded with profit, that I esteem the reading of him as a paradise for a curious spirit to walk in at all time." Bacon in his Advancement of Learning (1605) notes it as "the first distemper of learning when men study words and not matter." (I. iv. 3); he also observes that the Jesuits "have much quickened and strengthened the state of learning" (I. vi. 13). He is on the side of reform in education; he waves the humanist aside with the words: vetustas cessit, ratio vivit. Milton, in his Tractate on Education (1644), advances further on Bacon's lines, protesting against the length of time spent on instruction in language, denouncing merely verbal knowledge, and recommending the study of a large number of classical authors for the sake of their subject-matter, and with a view to their bearing on practical life. His ideal place of education is an institution combining a school and a university. Sir William Petty, the economist (1623-1687), urged the establishment of ergastula literaria for instruction of a purely practical kind. Locke, who had been educated at Winchester and had lectured on Greek at Oxford (1660), nevertheless almost completely eliminated Greek from the scheme which he unfolded in his Thoughts on Education (1693). With Locke, the moral and practical qualities of virtue and prudence are of the first consideration. Instruction, he declares, is but the least part of education; his aim is to train, not men of letters or men of science, but practical men armed for the battle of life. Latin was, above all, to be learned through use, with as little grammar as possible, but with the reading of easy Latin texts, and with no repetition, no composition. Greek he absolutely proscribes, reserving a knowledge of that language to the learned and the lettered, and to professional scholars.

Throughout the 18th century and the early part of the 19th, the old routine went on in England with little variety, and with no sign of expansion. The range of studies was widened, however. Sir R. Rugge in 1794-1842 by Thomas Arnold, whose interest in ancient history and geography, as a necessary part of classical learning, is attested by his edition of Thucydides; while his influence was still further extended when those who had been trained in his traditions became head masters of other schools.

During the rest of the century the leading landmarks are the three royal commissions known by the names of their chairmen: (1) Lord Clarendon's on nine public schools, Eton, Winchester, Westminster, Charterhouse, Harrow, Rugby, Shrewsbury, St. Paul's and Merchant Taylors' (1861-1864), resulting in the Public Schools Act of 1868; (2) Lord Taunton's on 78 endowed schools (1864-1867), followed by the act of 1869; and (3) Mr. Bryce's on secondary education (1894-1895).

A certain discontent with the current traditions of classical training found expression in the Essays on a Liberal Education (1867). The author of the first essay, C. S. Parker, closed his review of the reforms instituted in Germany and France by adding that in England there had been but little change. The same volume included a critical examination of the "Theory of Classical Education" by Henry Sidgwick, and an attack on compulsory Greek and Latin verse composition by F. W. Farrar. The claims of verse composition have since been judiciously defended by the Hon. Edward Lyttelton (1897), while a temperate and effective restatement of the case for the classics may be found in Sir Richard Jebb's Romanes Lecture on "Humanism in Education" (1899).

The question of the position of Greek in secondary education has from time to time attracted attention in connexion with the requirement of Greek in Responsions at Oxford, and in the Previous Examination at Cambridge.

In the Cambridge University Reporter for November 9, 1870, it was stated that, "in order to provide adequate encouragement for the study of Modern Languages and Natural Science," the commissioners for endowed schools had determined on the establishment of a modern school, to which Greek would be excluded. The commissioners feared that, so long as Greek was a sine qua non at the universities, these schools would be cut off from direct connexion with the universities, while the universities would in some degree lose their control over a portion of the higher culture of the nation. On the 9th of March 1871 a syndicate recommended that, in the Previous Examination, French and German (taken together) should be allowed in place of Greek; on the 27th of April this recommendation (which only affected candidates for honours or for medical degrees) was rejected by 51 votes to 48.

All the other proposals and votes relating to Greek in the Previous Examination in 1870-1873, 1878-1880, and 1891-1892 are set forth in the Cambridge University Reporter for November 11, 1904, pp. 202-205. In November 1903 a syndicate was
appointed to consider the studies and examinations of the university, their report of November 1904 on the Previous Examination was fully discussed, and the speeches published in the Reporter for December 17, 1904. In the course of the discussion Sir Richard Jebb drew attention to the statistics collected by the master of Emmanuel, Mr. W. Chawner, showing that, out of 86 head masters belonging to the Head Masters’ Conference whose replies had been published, “about 56 held the opinion that the exemption from Greek for all candidates for a degree would endanger or altogether extinguish the study of Greek in the vast majority of schools, while about 21 head masters held a different opinion.” On the 3rd of March 1905 a proposal for accepting either French or German as an alternative for either Latin or Greek in the Previous Examination was rejected by 1359 to 1052 votes, and on the 26th of May 1906 proposals distinguishing between students in letters and students in science, and (inter alia) requiring the latter to take either French or German for either Latin or Greek in the Previous Examination, were rejected by 746 to 211.

Meanwhile, at Oxford a proposal practically making Greek optional with all undergraduates was rejected, in November 1902, by 189 votes to 166; a preliminary proposal permitting students of mathematics or natural science to offer one or more modern languages in lieu of Greek was passed by 164 to 162 in February 1904, but on the 29th of November the draft of a statute to this effect was thrown out by 200 to 164. In the course of the controversy three presidents of the Royal Society, Lord Kelvin, Lord Lister and Sir W. Huggins, expressed the opinion that the proposed exemption was not beneficial to science students.

Incidentally, the question of “compulsory Greek” has stimulated a desire for greater efficiency in classical teaching. In December 1903, a year before the most important of the public discussions at Cambridge, the Classical Association was founded in London. The aim of that association is “to promote the development, and maintain the well-being, of classical studies, and in particular (a) to impress upon public opinion the claim of such studies to an eminent place in the national scheme of education; (b) to improve the practice of classical teaching by free discussion of its scope and methods; (c) to encourage investigation and call attention to new discoveries; (d) to create opportunities of friendly intercourse and co-operation between all lovers of classical learning in this country.”

The question of the curriculum and the time-table in secondary education has occupied the attention of the Classical Association, the British Association and the Education Department of Scotland. The general effect of the recommendations already made would be to begin the study of foreign languages with French, and to postpone the study of Latin to the age of twelve and that of Greek to the age of thirteen. At the Head Masters’ Conference of December 1907 a proposal to lower the standard of Greek in the entrance scholarship examinations of public schools was lost by 10 votes to 16, and the “British Association report” was adopted with reservations in 1908. In the case of secondary schools in receipt of grants of public money (about 700 in England and 100 in Wales in 1907–1908), “the curriculum and time-table must be approved by the Board of Education.” The Board has also a certain control over the curriculum of schools under the Endowed Schools Acts and the Charitable Trusts Acts, and also over that of schools voluntarily applying for inspection with a view to being recognized as efficient.

Further efficiency in classical education has been the aim of the movement in favour of the reform of Latin pronunciation. In 1871 this movement resulted in Munro and Palmer’s Syllabus of Latin Pronunciation. The reform was carried forward at University College, London, by Professor Key and by Professor Robinson Ellis in 1873, and was accepted at Shrewsbury, Marlborough, Liverpool College, Christ’s Hospital, Dulwich, and the City of London school. It was taken up anew by the Cambridge Philological Society in 1886, by the Modern Languages Association in 1901, by the Classical Association in 1904–1905, and the Philological Society of Oxford and Cambridge in 1906. The reform was accepted by the various bodies of head masters and assistant masters in December 1906–January 1907, and the proposed scheme was formally approved by the Board of Education in February 1907.

2. In France it was mainly with a view to promoting the study of Greek that the corporation of Royal Readers was founded by Francis I. in 1530 at the prompting of Francis I. of Budaecus. In the university of Paris, which was originally opposed to this innovation, the statutes of 1508 prescribed the study of Homer, Hesiod, Findar, Theocritus, Plato, Demosthenes and Isocrates (as well as the principal Latin classics), and required the production of three exercises in Greek or Latin in each week.

From the middle of the 16th century the elements of Latin were generally learned from unattractive abridgments of the grammatical more or less the French scholar, van Pauwren or Despautère (d. 1620), which, in its original folio editions of 1537–1538, was an excellent work. The unhappy lot of those who were compelled to learn their Latin from the current abridgments was lamented by Lecture of a Royalist in a striking passage describing the gloomy forest of le pays de Despautère (Guyot, quoted in Sainte-Beuve’s Port-Royal, iii. 420). The first Latin grammar written in French was that of Père de Condon of the Oratoire (c. 1642), which was followed by the Port-Royal Method in the Lactate and Claude Lancelot (1644), and by the grammar composed by Bossuet for the dauphin, and also used by Fénélon for the instruction of the duc de Bourgogne. In the second half of the 17th century the rules of grammar and rhetoric were simplified, and the time withdrawn from the practice of composition (especially verse composition) transferred to the explanation and the study of authors.

Richelieu, in 1640, formed a scheme for a college in which Latin was to have a subordinate place, while room was to be found for the study of history and science, Greek, and French and modern languages. Bossuet, in educating the dauphin, added to the ordinary classical routine the extended series of the “Delphin Classics” the study of history and of science. A greater originality in the method of teaching the ancient languages was exemplified by Fénélon, whose views were partially reflected by the Abbé Fleury, who also desired the simplification of grammar, the diminution of composition, and even the suppression of Latin verse. Of the ordinary teaching of Greek in his day, Fleury wittily observed that most boys “learned just enough of that language to have a pretext for saying for the rest of their lives that Greek was a subject easily forgotten.”

In the 18th century Rollin, in his Tractés des études (1726), agreed with the Port-Royalists in demanding that Latin grammars should be written in French, that the rules should be simplified and explained by a sufficient number of examples, and that a more important place should be assigned to translation than to composition. The supremacy of Latin was the subject of a long series of attacks in the same century. Even at the close of the previous century the brilliant achievements of French literature had prompted La Bruyère...
to declare in *Des ouvrages de l'esprit* (about 1680), "We have at last thrown off the yoke of Latinism"; and, in the same year, Jacques Spon claimed in his correspondence the right to use the French language in discussing points of archaeology.

Meanwhile, in 1553, notwithstanding the opposition of the university of Paris, the Jesuits had succeeded in founding the *Collegium Claramontanum*. After the accession of Henry IV. they were expelled from Paris and other important towns in 1594, and not allowed to return until 1609, when they found themselves confronted once more by their rival, the university of Paris. They opened the doors of their schools to the Greek and Latin classics, but they represented the ancient masterpieces dissevered from their original historic environment, as impersonal models of taste, as isolated standards of style. They did much, however, for the cultivation of original composition modelled on Cicero and Virgil. They have been charged with paying an exaggerated attention to form, and with neglecting the subject-matter of the classics. This neglect is attributed to their anxiety to avoid the "pagan" element in the ancient literature. Intensely conservative in their methods, they kept up the system of using Latin in their grammars (and in their oral instruction) long after it had been abandoned by others.

The use of French for these purposes was a characteristic of the "Little Schools" of the Jansenists of Port-Royal (1643–1660). The text-books prepared for them by Lancelot included not only the above-mentioned Latin grammar (1644) but also the *Méthode grecque* of 1655 and the *Jardin des racines grecques* (1657), which remained in use for two centuries and largely superseded the grammar of Clenardus (1636) and the *Tirocinium* of Père Labbe (1648). Greek began to decline in the university about 1650, at the very time when the Port-Royalists were aiming at its revival. During the brief existence of their schools their most celebrated pupils were Tillemont and Racine.

The Jesuits, on the other hand, claimed Corneille and Molîère, as well as Descartes and Bossuet, Fontenelle, Montesquieu and Voltaire. Of their Latin poets the best-known were Denis Petau (d. 1659), René Rapin (d. 1687) and N. E. Sanadon (d. 1732). In 1762 the Jesuits were suppressed, and more than one hundred schools were thus deprived of their teachers. The university of Paris, which had prompted their suppression, and the parliament, which had carried it into effect, made every endeavour to replace them. The university took possession of the *Collegium Claramontanum*, then known as the *Collegé Louis-le-Grand*, and transformed it into an école normale. Many of the Jesuit schools were transferred to the congregations of the Oratoire and the Benedictines, and to the secular clergy. On the eve of the Revolution, out of a grand total of 562 classical schools, 384 were in the hands of the clergy and 178 in those of the congregations.

The expulsion of the Jesuits gave a new impulse to the attacks directed against all schemes of education in which Latin held a prominent position. At the moment when the university of Paris was, by the absence of its rivals, placed in complete control of the education of France, she found herself driven to defend the principles of classical education against a crowd of assailants. All kinds of devices were suggested for expediting the acquisition of Latin; grammar was to be set aside; Latin was to be learned as a "living language"; much attention was to be devoted to acquiring an extensive vocabulary; and, "to save time," composition was to be abolished. To facilitate the reading of Latin texts, the favourite method was the use of interlinear translations, originally proposed by Locke, first popularized in France by Dumarsais (1722), and in constant vogue down to the time of the Revolution.

Early in the 18th century Rollin pleaded for the "utility of Greek," while he described that language as the heritage of the university of Paris. In 1753 Berthier feared that in thirty years no one would be able to read Greek. In 1768 Rolland declared that the university, which held Greek in high honour, nevertheless had reason to lament that her students learnt little of the language, and he traced this decline to the fact that attendance at lectures had ceased to be compulsory. Greek, however, was still recognized as part of the examination held for the appointment of schoolmasters.

During the 18th century, in Greek as well as in Latin, the general aim was to reach the goal as rapidly as possible, even at the risk of missing it altogether. On the eve of the Revolution, France was enjoying the study of the institutions of Greece in the attractive pages of the *Voyage du jeune Anacharsis* (1780), but the study of Greek was menaced even more than that of Latin. For fifty years before the Revolution there was a distinct dissatisfaction with the routine of the schools. To meet that dissatisfaction, the teachers had accepted new subjects of study, had improved their methods, and had simplified the learning of the dead languages. But even this was not enough. In the study of the classics, as in other spheres, it was revolution rather than evolution that was loudly demanded.

The Revolution was soon followed by the long-continued battle of the "Programmes." Under the First Republic the schemes of Congress, April 1790, and J. Lakanal (February 1795) were superseded by that of P. C. F. Daunou (October 1795), which divided the pupils of the "central schools" into three groups, according to age, with corresponding subjects of study: (1) twelve to fourteen,—drawing, natural history, Greek and Latin, and a choice of modern languages; (2) fourteen to sixteen,—mathematics, physics, chemistry; (3) over sixteen,—general grammar, literature, history and constitutional law.

In July 1801, under the consulate, there were two courses, (1) nine to twelve,—elementary knowledge, including elements of Latin; (2) above twelve,—a higher course, with two alternatives, "humanistic" studies for the "civil," and purely practical studies for the "military" section. The law of the 1st of May 1802 brought the lycées into existence, the subjects being, in Napoleon's own phrase, "mainly Latin and mathematics."

At the Restoration (1814) the military discipline of the lycées was replaced by the ecclesiastical discipline of the "Royal Colleges." The reaction of 1815–1821 in favour of classics was followed by the more liberal programme of Vatimesnil (1829), including, for those who had no taste for a classical education, certain "special courses" (1830), which were the germ of the *enseignement spécial* and the *enseignement moderne*.

Under Louis Philippe (1830–1848), amid all varieties of administration there was a consistent desire to hold the balance fairly between all the conflicting subjects of study. After the revolution of 1848 the difficulties raised by the excessive number of subjects were solved by H. N. H. Fortoul's expedient of "bifurcation," the alternatives being letters and science. In 1863, under Napoleon III., Victor Duruy encouraged the study of history, and also did much for classical learning by founding the Ecole des Hautes Études. In 1872, under the Third Republic, Jules Simon found time for hygiene, geography and modern languages by abolishing Latin verse composition and reducing the number of exercises in Latin prose, while he insisted on the importance of studying the inner meaning of the ancient classics. The same principles were carried out by Jules Ferry (1880) and Paul Bert (1881–1882). In the scheme of 1890 the Latin course of six years began with ten hours a week and ended with four; Greek was begun a year later with two hours, increasing to six and ending with four.

The commission of 1890, under the able chairmanship of M. Alexandre Ribot, published an important report, which was followed in 1902 by the scheme of M. Georges Leygues. The preamble includes a striking tribute to the advantages that France had derived from the study of the classics:

"L'étude de l'antiquité grecque et latine a donné au génie français une mesure, une clarté et une élégance incomparables. C'est par elle que notre philosophie, nos lettres et nos arts ont brillé d'un si
vif éclat; c'est par elle que notre influence morale s'est exercée en souveraine dans le monde. Les humanités doivent être protégées contre toute atteinte et fortémissé. Elles font partie du patrimoine national.

L'esprit classique n'est pas incompatible avec l'esprit moderne. Il est de tous les temps, parce qu'il est le culte de la raison claire et libre, la recherche de la beauté harmonieuse et simple dans toutes les manifestations de la pensée.

By the scheme introduced in these memorable terms the course of seven years is divided into two cycles, the first cycle (of four years) having two parallel courses: (1) without Greek or Latin, and (2) with Latin, and with optional Greek at the beginning of the third year. In the second cycle (of three years) those who have been learning both Greek and Latin, and those who have been learning neither, continue on the same lines as before; whereas those who have been learning Latin only may either (1) discontinue it in favour of modern languages and science, or (2) continue it with either. As an alternative to the second cycle, which normally ends in the examination for the baccalauréat, there is a shorter course, mainly founded on modern languages or applied science and ending in a public examination without the baccalauréat. The baccalauréat, however, has been condemned by the next minister, M. Briand, who prefers to crown the course with the award of a school diploma (1907).

(1840-1858); G. de Papin, Education et instruction, 4 vols., (1888); and H. I. Johnson, "Present State of Classical Studies in France," in Classical Review (December 1907). See also the English Education Department's Special Reports on Education in France (1896). The earlier literature is best represented in England by M. M. Arnold's Schools and Universities in France (1868; new edition 1892) and A French Etun (1864).

3. The history of education in Germany since 1500 falls into three periods: (a) the age of the Revival of Learning and the German Reformation (1500-1650), (b) the age of French influence (1650-1800), and (c) the 19th century.

(a) During the first twenty years of the 16th century the reform of Latin instruction was carried out by setting aside the old medieval grammars, by introducing new manuals of classical literature, and by prescribing the study of classical authors and the imitation of classical models. In all these points the lead was first taken by south Germany, and by the towns along the Rhine down to the Netherlands. The old schools and universities were being quietly interpenetrated by the new spirit of humanism, when the sky was suddenly darkened by the clouds of religious conflict. In 1525-1535 there was a marked depression in the classical studies of Germany. Erasmus, writing to W. Pirckheimer in 1528, exclaimed: "Wherever the spirit of scholasticism prevails, learning goes to the ground." Such a fate was, however, averted by the intervention of Melanchthon (d. 1560), the praeceptor Germaniae, who was the embodiment of the spirit of the new Protestant type of education, with its union of evangelical doctrine and humanistic culture. Under his influence, new schools rapidly rose into being at Magdeburg, Eisenach and Nuremberg (1521-1526). More than forty years of academic activity he not only provided manuals of Latin and Greek grammar and many other text-books that long remained in use, but he also formed for Germany a well-trained class of learned teachers, who extended his influence throughout the land. His principal ally as an educator and as a writer of text-books was Camerarius (d. 1574). Precepts of style, and models taken from the best Latin authors, were the means whereby a remarkable skill in the imitation of Cicero was attained at Staufen by the young scholar and later publisher of Johannes von Sturmm (d. 1580), who had himself been influenced by the De disciplinis of J. L. Vives (1531), and in all his teaching aimed at the formation of a sapiens etque eloquens pietas. Latin continued to be the living language of learning and of literature, and a correct and elegant Latin style was regarded as the mark of an educated person. Greek was taught in all the great schools, but became more and more confined to the study of the Greek Testament. In 1530 it was proposed in Brunswick to banish all "profane" authors from the schools, and in 1589 a competent scholar was instructed to translate the sacred epic on the kings of Israel as a substitute for the works of the "pagan" poets. In 1637, when the doubts of Scaliger and Heinsius as to the purity of the Greek of the New Testament prompted the rector of Hamburg to introduce the study of classical authors, any reflection on the style of the Greek Testament was bitterly resented.

The Society of Jesus was founded in 1540, and by 1600 most of the teachers in the Catholic schools and universities of Germany were Jesuits. The society was "dissolved" in 1773, but survived its dissolution. In accordance with the Ratio Studiorum of Aquaviva (1599), which long remained unaltered and was only partially revised by J. A. Roethaen (1831), the main subjects of instruction were the litterae humaniores diversarum linguarum. The chief place among these was naturally assigned to Latin, the language of the society and of the Roman Church. The Latin grammar in use was that of the Jesuit rector of the school at Lisbon, Alvarez (1572).

As in the Protestant schools, the principal aim was the attainment of eloquentia. A comparatively subordinate place was assigned to Greek, especially as the importance attributed to the Vulgate weakened the motive for studying the original text. It was recognized, however, that Latin itself (as Vivès had said) was "in no small need of Greek," and that, "unless Greek was learnt in boyhood, it would hardly ever be learnt at all." The text-book used was the Institutiones linguae Graecae of the German Jesuit, Jacob Getser, of Ingolstadt (c. 1590), and the reading in the highest class included portions of Demosthenes, Isocrates, Plato, Thucydides, Homer, Hesiod, Pindar, Gregory of Nazianzus, Basil and Chrysostom. The Catholic and Protestant schools of the 17th century succeeded, as a rule, in giving a command over a correct Latin style and a taste for literary form and for culture. Latin was still the language of the law-courts and of a large part of general literature. Between Luther and Lessing there was no great writer of German prose.

(b) In the early part of the period 1650-1800, while Latin continued to hold the foremost place, it was ceasing to be Latin of the strictly classical type. Greek fell still further into the background; and Homer and Demosthenes gradually gave way to the Greek Testament. Between 1650 and 1775 there was a great gap in the production of new editions of the principal Greek classics. The spell was only partially broken by J. A. Ernesti's Homer (1759 f.) and Chr. G. Heyne's Pindar (1773 f.).

The peace of Westphalia (1648) marks a distinct epoch in the history of education in Germany. Thenceforth, education became more modern and more secular. The long wars of religion in Germany, as in France and England, were followed by a certain indiscipline as to disputed points of theology. But the modern and secular type of education that now supervened was opposed by the pietism of the second half of the 17th century, represented at the newly-founded university of Halle (1694) by A. H. Francke, the professor of Greek (d. 1727), whose influence was far greater than that of Chr. Cellarius (d. 1707), the founder of the first philological Seminar (1697). Francke's contemporary, Chr. Thomasius (d. 1728), was never weary of attacking scholarship of the old humanistic type and everything that savoured of antiquarian pedantry, and it was mainly his influence that made German the language of university lectures and of scientific and learned literature. A modern education is also the aim of the general introductions to the nova methodus of Leibniz, where the study of Greek is recommended, so that for grammar of the Greek Testament (1666). Meanwhile, Ratinius (d. 1635) had in vain pretended to teach Hebrew, Greek and Latin in the space of six months (1612), but he had the merit of maintaining that the study of a language should begin with the study of an author. Comenius (d. 1671) proposed to teach Latin by drilling his
pupils in a thousand graduated phrases distributed over a hundred instructive chapters, while the Latin authors were banished because of their difficulty and their "paganism" (1631). One of the catchwords of the day was to insist on a knowledge of things instead of a knowledge of words, on "realism" instead of "verbalism."

Under the influence of France the perfect courtier became the ideal in the German education of the upper classes of the 17th and 18th centuries. A large number of aristocratic schools (Ritter-Akademien) were founded, beginning with the Collegium Illustre of Tübingen (1589) and ending with the Hohe Karlshule of Stuttgart (1775). In these schools the subjects of study included mathematics and natural sciences, geography and history, and modern languages (especially French), with riding, fencing and dancing; Latin assumed a subordinate place, and classical composition in prose or verse was not considered a sufficiently courtly accomplishment. The youthful aristocracy were thus withdrawn from the old Latin schools of Germany, but the aristocratic schools vanished with the dawn of the 19th century, and the ordinary public schools were once more frequented by the young nobility.

(c) The Modern Period.—In the last third of the 18th century two important movements came into play, the "naturalism" of Rousseau and the "new humanism." While Rousseau sought his ideal in a form of education and of culture that was in close accord with nature, the German apostles of the new humanism were convinced that they had found that ideal completely realized in the old Greek world. Hence the aim of education was to make young people thoroughly "Greek," to fill them with the "Greek" spirit, with courage and keenness in the quest of truth, and with a devotion to all that was beautiful. The link between the naturalism of Rousseau and the new humanism is to be found in J.G. Herder, whose passion for all that is Greek inspires him with almost a hatred of Latin. The new humanism was a kind of revival of the Renaissance, which had been retarded by the Reformation in Germany and by the Counter-Reformation in Italy, or had at least been degraded to the dull classicism of the schools. The new humanism agreed with the Enlightenment. In its unreserved recognition of the old classical world as a period of civilization, while the Renaissance aimed at reproducing the Augstant age of Rome, the new humanism found its golden age in Athens. The Latin Renaissance in Italy aimed at recovering and verbally imitating the ancient literature; the Greek Renaissance in Germany sought inspiration from the creative originality of Greek literature with a view to producing an original literature in the German language. The movement had its effect on the schools by discarding the old classical routine of verbal imitation, and giving a new prominence to Greek and to German.

The new humanism found a home in Göttingen (1783) in the days of J. M. Gesner and C. G. Heyne. It was represented at Leipzig by Gesner's successor, Ernesti (d. 1781); and at Halle by F. A. Wolf, who in 1783 was appointed professor of education by Zedlitz, the minister of Frederick the Great. In literature, its leading names were Winckelmann, Lessing and Voss, and Herder, Goethe and Schiller. The tide of the new movement had reached its height about 1800. Goethe and Schiller were convinced that the old Greek world was the highest revelation of humanity; and the universities and schools of Germany were reorganized in this spirit by F. A. Wolf and his illustrious pupil, Wilhelm von Humboldt. In 1809-1810 Humboldt was at the head of the educational section of the Prussian Home Office, and, in the brief interval of a year and a half, gave to the general system of education the direction which it followed (with slight exceptions) throughout the whole century. In 1810 the examen pro facultate docendi first made the profession of a schoolmaster independent of that of a minister of religion. The new scheme drawn up by J. W. Sivern recognized four principal co-ordinated branches of learning: Latin, Greek, German, mathematics. All four were studied throughout the school, Greek being begun in the fourth of the nine classes, that corresponding to the English "third form." The old Latin school had only one main subject, the study of Latin style (combined with a modicum of Greek). The new gymnasia aimed at a wider education, in which literature was represented by Latin, Greek and German, by the side of mathematics and natural science, history and religion. The uniform employment of the term Gymnasium for the highest type of a Prussian school dates from 1812. The leaving examination (Abgangsprüfung), instituted in that year, required Greek translation at sight, with Greek prose composition, and ability to speak and to write Latin. In 1818-1840 the leading spirit on the board of education was Johannes Schulze, and a complete and comprehensive system of education continued to be the ideal kept in view. Such an education, however, was found in practice to involve a prolongation of the years spent at school and a correspondingly later start in life. It was also attacked on the ground that it led to "overwork." This attack was partially met by the scheme of 1837. Schulze's period of prominence in Berlin closely corresponded to that of Herbart at Königsberg (1809-1833) and Göttingen (1833-1841), who insisted that for eight years there was no better text-book than the Greek Odyssey, and this school scheme of 1824, which was brought into practice at Hanover by his distinguished pupil, Ahrens.

The Prussian policy of the next period, beginning with the accession of Friedrich Wilhelm IV. in 1840, was to lay a new stress on religious teaching, and to obviate the risk of overwork resulting from the simultaneous study of all subjects by the encouragement of specialization in a few. Ludwig Wiese's scheme of 1856 insisted on the retention of Latin verse as well as Latin prose, and showed less favour to natural science, but it awakened little enthusiasm, while the attempt to revive the old humanistic Gymnasium led to a demand for schools of a more modern type, which issued in the recognition of the Realgymnasium (1859).

In the age of Bismarck, school policy in Prussia had for its aim an increasing recognition of modern requirements. In 1875 Wiese was succeeded by Bonitz, the eminent Aristotelian scholar, who in 1849 had introduced mathematics and natural science into the schools of Austria, and had substituted the wide reading of classical authors for the prevalent practice of speaking and writing Greek. The "school scheme of 1882" that natural science recovered its former position in Prussia, and the hours spent in each week to Latin were diminished from 86 to 77. But neither of the two great parties in the educational world was satisfied, and great expectations were aroused when the question of reform was taken up by the German emperor, William II., in 1890. The result of the conference of December 1890 was a compromise between the conservatism of a majority of its members and the forward policy of the emperor. The scheme of 1892 reduced the number of hours assigned to Latin from 77 to 62, and laid special stress on the German essay; but the modern training given by the Realgymnasium was still unrecognized as an avenue to a university education. A conference held in June 1900, in which the speakers included Mommsen and von Wilamowitz, Harnack and Diels, was followed by the "Kiel Decree" of the 26th of November. In that decree the emperor urged the equal recognition of the classical and the modern Gymnasium, and emphasized the importance of giving more time to Latin and to English in both. In the teaching of Greek, "useless details" were to be set aside, and special care devoted to the connexion between ancient and modern culture, while, in all subjects, attention was to be paid to the classic precept: mulsum, non multa.

By the scheme of 1901 the pupils of the Realgymnasium, the Oberrealschule and the Gymnasium were admitted to the university on equal terms in virtue of their leaving-certificates, but Greek and Latin were still required for students of classics or divinity.

For the Gymnasium the aim of the new scheme is, in Latin, "to supply boys with a sound basis of grammatical training, with a view to their understanding the more important classical
writers of Rome, and being thus introduced to the intellectual life and culture of the ancient world; and, in Greek, "to give them a sufficient knowledge of the language with a view to their obtaining an acquaintance with some of the Greek classical works which are distinguished both in matter and in style, and thus gaining an insight into the intellectual life and culture of Ancient Greece." In consequence of these changes Greek is now studied by a smaller number of boys, but with better results, and a new lease of life has been won for the classical Gymnasium.

Lastly, by the side of the classical Gymnasium, we now have the "German Reform Schools" of two different types, that of Altona (dating from 1878) and that of Frankfort-on-the-Main (1892). The leading principle in both is the postponement of the time for learning Latin. Schools of the Frankfort type take French as their only foreign language in the first three years of the course, and aim at achieving in six years as much as has been achieved by the Gymnasium in nine; and it is maintained that, in six years, they succeed in mastering a larger amount of Latin literature than was attempted a generation ago, even in the best Gymnasium of the old style. It may be added that in all the German Gymnasien, where the time is given to classics than in the corresponding schools in England.

Russell, German Higher Schools (New York, 1904); E. C. Capron, The Universities of Germany (1874, reprinted from Schools and Universities on the Continent, 1865).

(4) In the United States of America the highest degree of educational development has been subsequent to the Civil War.

The study of Latin begins in the "high schools," the average age of admission being fifteen and the normal course extending over four years. Among classical teachers an increasing number would prefer a longer course extending over five or six years, and some of these would assign to the elementary school the first two of the proposed six years of Latin study. Others are content with the late learning of Latin and prefer that it should be preceded by a thorough study of modern languages (see Prof. B. I. Wheeler, in Baumeister's Handbuch, 1897, ii. 2, pp. 583-586).

It was mainly owing to a pamphlet issued in 1871 by Prof. G. M. Lane, of Harvard, that a reformed pronunciation of Latin was adopted in all the colleges and schools of the United States. Some misgivings on this reform found expression in a work on the Teaching of Latin, published by Prof. C. E. Bennett of Cornell in 1901, a year in which it was estimated that this pronunciation was in use by more than 96% of the Latin pupils in the secondary schools.

Some important statistics as to the number studying Latin and Greek in the secondary schools were collected in 1900 by a committee of twelve educational experts representing all parts of the Union, with a view to a uniform course of instruction being pursued in all classical schools. They had the advantage of the co-operation of Dr W. T. Harris, the U.S. commissioner of education, and they were able to report that, in all the five groups into which they had divided the states, the number of pupils pursuing the study of Latin and Greek showed a remarkable advance, especially in the most progressive states of the middle west. The number learning Latin had increased from 100,144 in 1890 to 314,856 in 1890-1900, and those learning Greek from 12,860 to 24,860. Thus the number learning Latin at the later date was three times, and the number learning Greek twice, as many as those learning Latin or Greek ten years previously. But the total number in 1900 was 639,048; so that, notwithstanding this progress of the number learning Greek in 1900 was only about one twenty-fifth of the total number, while the number learning Latin was as high as half.

The position of Greek as an "elective" or "optional" subject (notably at Harvard), an arrangement regarded with approval by some eminent educational authorities and with regret by others, probably has some effect on the high schools in the small number of those who learn Greek, and in their lower rate of increase, as compared with those who learn Latin. Some evidence as to the quality of the study of those languages in the schools is supplied by English commissioners in the Reports of the Mostly Commission. Thus Mr Papillon considered that, while the teaching of English literature was admirable, the average standard of Latin and Greek teaching and attainment in the upper classes was "below that of an English public school"; he felt, however, that the secondary schools of the United States had a "greater variety of the curriculum to suit the practical needs of life," and that they existed, not "for the select few," but "for the whole people" (pp. 250 f.).

CLASSIFICATION (Lat. classis, a class, probably from the root kal-, -cla-, as in Gr. καλέω, clamo, a logical process, common to all the special sciences and to knowledge in general, consisting in the collection under a common name of a number of objects which are alike in one or more respects. The process consists in observing the objects and abstracting from their various qualities that characteristic which they have in common. This characteristic constitutes the definition of the "class" to which they are regarded as belonging. It is this process by which we arrive first at "species" and then at "genus," i.e. at all scientific generalization. Individual things, regarded as such, constitute a mere aggregate, unconnected with one another, and so far unexplained; scientific knowledge consists in systematic classification. Thus if we observe the heavenly bodies individually we can state merely that they have been observed to have certain motions through the sky, that they are luminous, and so on; like.

If, however, we compare them one with another, we discover that, whereas all partake in the general movement of the heavens, some have a movement of their own. Thus we arrive at a system of classification according to motion, by which fixed stars are differentiated from planets. A further classification according to other criteria gives us stars of the first magnitude and stars of the second magnitude, and so forth. We thus arrive at a systematic understanding expressed in laws by the application of which accurate forecasts of celestial phenomena can be made. Classification in the strict logical sense consists in discovering the casual interrelation of natural objects; it thus differs from what is often called "artificial" classification, which is the preparation, e.g. of statistics for particular purposes, administrative and the like.

Of the systems of classification adopted in physical science, only one requires treatment here, namely, the classification of
the sciences as a whole, a problem which has from the time of Aristotle attracted considerable attention. Its object is to delimit the sphere of influence of the positive sciences and show how they are mutually related. Of such attempts three are especially noteworthy, those of Francis Bacon, Auguste Comte and Herbert Spencer.

Bacon's classification is based on the subjective criterion of the various faculties which are specially concerned. He thus distinguished History (natural, civil, literary, ecclesiastical) as the province of memory, Philosophy (including Theology) as that of reason, and Poetry, Fables and the like, as that of imagination. This classification was made the basis of the Encyclopédie. Comte adopted an entirely different system based on an objective criterion. Having first enunciated the theory that all science passes through three stages, theological, metaphysical and positive, he neglects the two first, and divides the last according to the "things to be classified," in view of their real affinity and natural connexions, into six, in order of decreasing generality and increasing complexity—mathematics, astronomy, physics, chemistry, physiology and biology (including psychology), and sociology. This he conceives to be not only the logical, but also the historical, order of development, from the philosophical (including mathematics) to the biological. Sociology is thus the highest, most complex, and most positive of the sciences. Herbert Spencer, condemning this division as both incomplete and theoretically unsound, adopted a three-fold division into (1) abstract science (including logic and mathematics) dealing with the universal forms under which all knowledge of phenomena is possible, (2) abstract-concrete science (including mechanics, chemistry, physics), dealing with the elements of phenomena themselves, i.e., laws of forces as deducible from the persistence of forces, and (3) concrete science (e.g., astronomy, biology, sociology), dealing with "phenomena themselves in their totalities," the universal laws of the continuous redistribution of Matter and Motion, Evolution and Dissolution.

Beside the above three systems several others deserve brief mention. In Greece at the dawn of systematic thought the physical sciences were few in number; none the less philosophers were not agreed as to their true relation. The Platonic school adopted a triple classification, physics, ethics and dialectics; Aristotle's system was more complicated, nor do we know precisely how he subdivided his three main classes, theoretical, ethical and practical. The former includes Physics, Geography and Mathematics; the second class covered ethics and politics, the latter of which was often regarded by Aristotle as including ethics; the third includes the useful and the imitative sciences; the first includes metaphysics and physics. As regards pure logic Aristotle sometimes seems to include it with metaphysics and physics, sometimes to regard it as ancillary to all the sciences.

Thomas Hobbes (Leviathan) drew up an elaborate paradigm of the sciences, the first stage of which was a dichotomy into "Natural Philosophy" ("consequences from the accidents of bodies natural") and "Polities and Civill Philosophy" ("consequences from accidents of Politique bodies"). The former includes Physics, Geography and Mathematics; the latter divides into the rights and duties of sovereign powers, and those of the subject.

Jeremy Bentham and A. M. Ampère both drew up elaborate systems based on the principle of dichotomy, and beginning from the distinction of mind and body. Bentham invented an artificial terminology which is rather curious than valuable. The science of the body was Somatology, that of the mind Pneumatology. Physics (including mathematics and Physics) and Psychiatry (including psychology). Posology includes Morphoscopic (geometry) and Alemorphic (arithmetic). See further Bentham's Chrestomathia and works quoted under Bentham, Jeremy.

Carl Wundt criticized most of these systems as taking too little account of the real facts, and preferred a classification based on the standpoint of the various sciences towards their subject-matter. His system may, therefore, be described as conceptional. It distinguishes philosophy, which deals with facts in their widest universal relations, from the special sciences, which consider facts in the light of a particular relation or set of relations. All these systems have a certain value, and are interesting as throwing light on the views of those who invented them. It will be seen, however, that none can lay claim to unique validity. The fundamenta divisionis, though in themselves more or less logical, are quite arbitrarily chosen, generally as being germane to a preconceived philosophical or scientific theory.

CLASTIDIUM—Claude, J., German philosopher, was born at Solingen, in Westphalia, on the 24th of February 1622. After travelling in France and England, he studied the Cartesian philosophy under John Raey at Leiden. He became (1649) professor of philosophy and theology at Herborn, but subsequently (1651), in consequence of the jealousy of his colleagues, accepted an invitation to a similar post at Duisburg, where he died on the 31st of January 1665. Clauber was one of the earliest teachers of the new doctrines in Germany and an exact and methodical commentator on his master's writings. His theory of the connexion between the soul and the body is in some respects analogous to that of Malebranche; but he is not therefore to be regarded as a true forerunner of Occasionalism, as he uses "Occasion" for the stimulus which directly produces a mental phenomenon, without postulating the intervention of God (H. Müller, J. Clauberg und seine Stellung im Cartesismus). His view of the relation of God to his creatures is held to be indebted to the theories of Maupertuis, that all the phenomena of the Universe exist only through the continuous creative energy of the Divine Being, and are no more independent of his will than are our thoughts independent of us,—or rather less, for there are thoughts which force themselves upon us whether we will or not. For metaphysics Clauber suggested the names ontosopy or ontology, the latter being afterwards adopted by Wolff. He also devoted considerable attention to the German languages, and his research in this direction attracted the favourable notice of Leibnitz. His chief works are: De conjunctione animae et corporis humani; Exercitationes centum de cognitione Dei et nostri; Logica vetus et nova; Initiatio philosophi, seu Dubitatio Cartesiana; a commentary on Descartes' Méditations; and Ars eymologica Teutonum.

A collected edition of his philosophical works was published at Amsterdam (1691), with a life by H. C. Hennin; see also E. Zeller, Geschichte der deutschen Philosophie seit Leibnitz (1873).

CLAUDIUS—Claude, Jean (1619—1687), French Protestant divine, was born at La Sauvetat-du-Dropt near Agen. After studying at Montauban, he entered the ministry in 1645. He was for eight years the spiritual leader of the Protestants in the Protestant college of Nîmes; but in 1661, having successfully opposed a scheme for re-unifying Catholics and Protestants, he was forbidden to preach in Lower Languedoc. In 1662 he obtained a post at Montauban similar to that which he had lost; but after four years he was removed from this also. He next became pastor at Charenton near Paris, where he engaged in controversies with Pierre Nicole (Réponse aux deux traités intitulés la persévérance de la foi, 1665), Antoine Arnauld (Réponse au livre de M. Arnauld, 1670), and J. B. Bossuet (Réponse au livre de M. l'évêque de Meaux, 1683).
On the revocation of the edict of Nantes he fled to Holland, and received a pension from William of Orange, who commissioned him to write an account of the persecuted Huguenots (Plaist des protestants cruellement opprimés dans le royaume de France, 1686). The book was translated into English, but by order of James II. both the translation and the original were publicly burnt by the common hangman on the 5th of May 1686, as containing “expressions scandalous to His Majesty the king of France.” Other works by him were Réponse au livre de P. Noutet sur la eucharistie (1668); Œuvres posthumes (Amsterdam, 1688), containing the Traité de la composition d’un sermon, translated into English in 1778.

CLAUSE OF LORRAINE, or CLAUDE GÉLÉE (1600-1682), French landscape-painter, was born of very poor parents at the village of Châmage in Lorraine. When he was discovered that he had no progress at school, he was apprenticed, it is commonly said, to a pastry-cook, but this is extremely dubious. At the age of twelve, being left an orphan, he went to live at Freiburg on the Rhine with an elder brother, Jean Gélee, a wood-carver of moderate ability, and full of clownishness and foliage. He afterwards rambled to Rome to seek a livelihood; but from his clownishness and ignorance of the language, he failed to obtain permanent employment. He next went to Naples, to study landscape painting under Godfrey Waals, a painter of much repute. With him he remained two years; then he returned to Rome, and was domesticated until April 1625 with another landscape-painter, Augustin Tassi, who hired him to grind his colours and to do all the household drudgery.

His master, hoping to make Claude serviceable in some of his greatest works, advanced him in the rules of perspective and the elements of design. Under his tuition the mind of Claude began to expand, and he devoted himself to artistic study with great eagerness. He exerted his utmost industry to explore the true principles of painting by an incessant examination of nature; and for this purpose he made his studies in the open fields, where he very frequently remained from sunrise till sunset, watching the effect of the shifting light upon the landscape. He generally sketched whatever he thought beautiful or striking, marking every tinge of light with a simple pencil; from these sketches he afterwards worked up his pictures. Leaving Tassi, he made tours in Italy, France and Germany, including his native Lorraine, suffering numerous misadventures by the way. Karl Dervent, painter to the duke of Lorraine, kept him as assistant for a year; and he painted at Nancy the architectural subjects on the ceiling of the Carmelite church. He did not, however, relish this employment, and in 1627 returned to Rome. Here, painting two landscapes for Cardinal Bentivoglio, he earned the protection of Pope Urban VIII. and from about 1637 he rapidly rose into celebrity. Claude was acquainted not only with the facts, but also with the laws of nature; and the German painter Joachim von Sandrart relates that he used to explain, as they walked together through the fields, the causes of the different appearances of the same landscape at different hours of the day, from the reflections or refrations of light, or from the morning and evening dews or vapours, with all the precision of a natural philosopher. He elaborated his pictures with great care; and if any performance fell short of his ideal, he altered, erased and repainted it several times over. His works are full of life and colour; the sun is reflected full of lustre, and every object harmoniously illuminated. His distances and colouring are delicate, and his tints have a sweetness and variety till then unprecedented. He frequently gave an uncommon tenderness to his finished trees by glazing. His figures, however, are very indifferent; but he was so conscious of his deficiency in this respect, that he usually engaged other artists to paint them for him, among whom were Courtois and Filippo Lauri.Indeed, he was wont to say that he sold his landscapes and gave away his figures. In order to avoid a repetition of the same subject, and also to detect the very numerous spurious copies of his works, he made tinted outline drawings (in six paper books prepared for this purpose) of all those pictures which were transmitted to different countries; and on the back of each drawing he wrote the name of the purchaser. The book he named Libri di ser. This valuable work (now belonging to the duke of Devonshire) has been engraved and published, and has always been highly esteemed by students of the art of landscape. Claude, who had suffered much from gout, died in Rome at the age of eighty-two, on the 21st (or perhaps the 23rd) of November 1682, leaving his wealth, which was considerable, between his only surviving relatives, a nephew and an adopted daughter (unto née).

Many choice specimens of his genius may be seen in the National Gallery and in the Louvre; the landscapes in the Altiern and Colonna palaces in Rome are also of especial celebrity. A list has been printed showing no less than 92 examples in the various public galleries of Europe. He himself regarded a landscape which he painted in the Villa Madama, being a cento of various views with great abundance and variety of leafage, and a composition of Esther and Ahasuerus, as his finest works; the former he refused to sell, although Clement IX. offered to cover its surface with gold pieces. He etched a series of twenty-eight landscapes, fine impressions of which are greatly prized. Full of rugged beauty, and deeply sensitized to the graces of nature, Claude was long deemed the leader of landscape painters, and he must always be accounted a prime leader in the formation of art, and in his day a great enlarger and refiner of his province.

Claude was a man of amiable and simple character, very kind to his pupils, a patient and unwearyed worker; in his own sphere of study, his mind was stored (as we have seen) with observation and knowledge, but he continued an unlettered man till his death. Famous and highly patronized though he was in all his later years, he seems to have been very little known to his brother artists, with the single exception of Sandrart. This painter is the chief direct authority for the facts of Claude’s life (Academia Artis Pictoriae, 1683); Baldinucci, who obtained information from some of Claude’s immediate survivors, relates various incidents to a different effect (Notissi dei professori del disegno).

See also Victor Cousin, Sur Claude Gélee (1853); M. F. Sweetser, Claude Lorrain (1878); Lady Dilke, Claude Lorrain (1884).

(W. M. R.)

CLAUDET, ANTOINE FRANÇOIS JEAN (1797-1867), French photographer, was born at Lyons on the 24th of August 1797. Having acquired a share in L. M. Daguerre’s invention, he was one of the first to practise daguerreotype portraiture in England, and he improved the sensitizing process by using chlorine in addition to iodine, thus gaining greater rapidity of action. In 1848 he produced the photometer, an instrument designed to measure the intensity of photogenic rays; and in 1849 he brought out the fogimeter, for securing a perfect focus in photographic portraiture. He was elected a fellow of the Royal Society in 1853, and in 1858 he produced the stereomicroscope, in reply to a challenge from Sir David Brewster. He died in London on the 27th of December 1867.

CLAUDIUS, CLAUDIUS, Latin epic poet and panegyrist, flourished during the reign of Arcadius and Honorius. He was an Egyptian by birth, probably an Alexandrian, but it may be conjectured from his name and his mastery of Latin that he was of Roman extraction. His own authority has been assumed for the assertion that his first poetical compositions were in Greek, and that he had written nothing in Latin before A.D. 395; but this seems improbable, and the passage (Carm. Min. xii. 13) which is taken to prove it does not necessarily bear this meaning. In that year he appears to have come to Rome, and made his début as a Latin poet by a panegyric on the consulate of Olybrius and Probinus, the first brothers not belonging to the imperial family who had ever simultaneously filled the office of consul. This piece proved the precursor of the series of panegyrical poems which compose the bulk of his writings. In Birt’s edition a complete chronological list of Claudian’s poems is given, and also in J. B. Bury’s edition of Gibbon (iii. app. i. p. 485), where the dates given differ slightly from those in the present article.

In 396 appeared the encomium on the third consulschip of the emperor Honorius, and the epic on the downfall of Rufinus, the
unworthy minister of Arcadius at Constantinople. This revolution was principally effected by the contrivance of Stilicho, the great general and minister of Honorius. Claudian's poem appears to have obtained his patronage, or rather that of his wife Serena, by whose interposition the poet was within a year or two enabled to contract a wealthy marriage in Africa (Epist. 2). Previously to this event he had produced (358) his panegyric on the fourth consulship of Honorius, his epitaphium on the marriage of Honorius to Stilicho's daughter, Maria, and his poem on the Gildonic war, celebrating the repression of a revolt in Africa. To these succeeded his piece on the consulship of Manlius Theodorus (399), the unfinished or mutilated invective against the Byzantine prime minister Eutropius in the same year, the epic on Stilicho's first consulship and on his repulse of Alaric (400 and 403), and the panegyric on the sixth consulship of Honorius (404). From this time all trace of Claudian is lost, and he is generally supposed to have perished with his patron Stilicho in 408. It may be conjectured that he must have died in 404, as he could hardly otherwise have omitted to celebrate the greatest of Stilicho's achievements, the destruction of the barbarian host led by Radagaisus for the following year. On the other hand, he may have survived Stilicho, as has been conjectured by the second book of his epic on the Rape of Proserpine (which Birt, however, assigns to 395-397), he speaks of his disuse of poetry in terms hardly reconcilable with the fertility which he displayed during his patron's lifetime. From the manner in which Augustine alludes to him in his De civitate Dei, it may be inferred that he was no longer living at the date of the composition of that work, between 415 and 428.

Besides Claudian's chief poems, his lively Fescennines on the emperor's marriage, his panegyricon on Serena, and the Gigantomachio, a fragment of an unfinished Greek epic, may also be mentioned. Several poems expressing Christian sentiments are undoubtedly spurious. Claudian's paganism, however, neither prevented his celebrating Christian rulers and magistrates nor his enjoying the distinction of a court laureate. It is probable that he was nominally a Christian, like his patron Stilicho and Ausonius, although at heart attached to the old religion. The very decided statements of Orosius and Augustine as to his heathenism may be explained by the pagan style of Claudian's political poems. We have only the two strophai of the ambiguous poem on the alleged statue in the forum, and Pomponius Laetus discovered in the 15th century an inscription (C.I.L. vi. 1710) on the pedestal, which, formerly considered spurious, is now generally regarded as genuine.

The position of Claudian—the last of the Roman poets—is unique in literature. It is sufficiently remarkable that, after nearly three centuries of torpor, the Latin muse should have experienced any revival in the age of Honorius, nothing less than amazing that this revival should have been the work of a foreigner, most surprising of all that a just and enduring celebrity should have been gained by official panegyrics on the generally uninteresting transactions of an inglorious epoch. The first of these particulars bespeaks Claudian's taste, rising superior to the prevailing barbarism, the second his command of language, the third his rhetorical skill. As remarked by Gibbon, “he was endowed with the rare and precious talent of raising the meanest, of adorning the most barren, and of diversifying the most similar topics.” This gift is especially displayed in his poem on the restoration of Stilicho, where the punishment of a public offender is exalted to the dignity of an epic subject by the magnificence of diction and the ostentation of supernatural machinery. The noble exordium, in which the fate of Rufinus is propounded as the vindication of divine justice, places the subject at once on a dignified level; and the council of the infernal powers has afforded a hint to Tasso, and through him to Milton. The inevitable monotony of the panegyrics on Honorius is relieved by just and brilliant expatiation on the duties of a sovereign. In his celebration of Stilicho's victories Claudian found a subject more worthy of his powers, and some passages, such as the description of the flight of Alaric, and of Stilicho's arrival at Rome, and the felicitous parallel between his triumphs and those of Marius, rank among the brightest ornaments of Latin poetry. Claudian's panegyric, however lavish and regardless of veracity, is in general far less offensive than usual in his age, a circumstance attributable partly to his more refined taste and partly to the genuine merit of his patron Stilicho.

He is a valuable authority for the history of his times, and is rarely to be convicted of serious inaccuracy in his facts, whatever may be thought of the colouring he chooses to impart to them. He was animated by true patriotic feeling, in the shape of a reverence for Rome as the source and symbol of law, order and civilization. Outside the sphere of actual life he is less successful; his Rape of Proserpine, though the beauties of detail are as great as usual, betrays his deficiency in the creative power requisite for dealing with a purely ideal subject. This denotes the rhetorician rather than the poet, and in general it may be said that his especial gifts of vivid natural description, and of copious illustration, derived from extensive but not cumbering erudition, are far more adequate to eloquence as to poetry. In the general cast of his mind and character of his writings, and especially in his faculty for bestowing enduring interest upon occasional themes, we may fairly compare him with Dryden, remembering that while Dryden exulted in the energy of a vigorous and last resort, Claudian was cramped by an artificial diction, confined to the literal classics.

The editio princeps of Claudian was printed at Vicenza in 1482; the editions of J. M. Gesner (1759) and P. Burmann (1760) are still valuable for their notes. The first critical edition was that of L. Feussler (1779), which supplied a detailed transcript of the text. We also have the exhaustive work of T. Birt, with bibliography, in Monumenta Germaniae Historica (8 vols., 1892-1897). There is a separate edition with commentary and verse translation of Il Rapo di Proserpina, by L. Garces de Diez (1889); the satire In Eumomachiam is discussed by T. Birt in Zwei politische Säûren des Altertumswissenschaft, 2nd series (1875-1879), and his edition is applied to the first political satire of the age in the Roman Poets (1875).

CLAUDIUS [TIBERIUS CLAUDIUS DRUSUS NEBI GERMANICUS], Roman emperor a.d. 41-54, son of Drusus and Antonia, nephew of the emperor Tiberius, and grandson of Livia, the wife of Augustus, was born at Lugdunum (Lyons) on the 15th of August, 10 B.C. During his boyhood he was treated with contempt, owing to his weak and timid character and his natural infirmities; the fact that he was regarded as littlc better than an imbecile saved him from death at the hands of Caligula. He chiefly devoted himself to literature, especially history, and until his accession he took no real part in public affairs, though Caligula honoured him with the dignity of consul. He was four times married: to Plautia Urgulanilla, whom he divorced because he suspected her of designs against his life; to Adelia Petina, also divorced; to the infamous Valeria Messalina (q.v.); and to his niece Agrippina.

In a.d. 41, on the murder of Caligula, Claudius was seized by the praetorians, and declared emperor. The senate, which had entertained the idea of restoring the republic, was obliged to acquiesce. One of Claudius's first acts was to proclaim an amnesty for all except Cassius Chaerea, the assassin of his predecessor, and one or two others. After the discovery of a conspiracy against him in 42, he fell completely under the influence of Messalina, who had married him as an adulteress; she was most infernal and Narsissus, who must be held responsible for acts of cruelty which have brought undeserved odium upon the emperor. There is no doubt that Claudius was a liberal-minded man of kindly nature, anxious for the welfare of his people. Humane regulations were made in regard to freedmen, slaves, widows and orphans; the police system was admirably organized; commerce was put on a sound footing; the provinces were governed in a spirit of liberality; the rights of citizens and admission to the senate were extended to communities outside Italy. The speech of Claudius delivered (in the year 48) in the senate in support of the petition of the Aeduians that their senators should have the jus petendorum honorum (claim of
admission to the senate and magistracies) at Rome has been partly preserved on the fragment of a bronze tablet found at Lyons in 1524; an imperial edict concerning the citizenship of the Aequians (15th of March 46) was found in the southern Tyrol in 1869 (C.I.L. v. 5050). Claudia was especially fond of building. He completed the great aqueduct (Aqua Claudia) begun by Caligula, drained the Locus Fucinus, and built the harbour of Ostia. Nor were his military operations unsuccessful. Mauretanias was made a Roman province; the conquest of Britain was begun; his distinguished general Domitius Corbulus (q.v.) gained considerable successes in Germany and the East. The intrigues of Narcissus caused Messallina to be put to death by order of Claudia, who took as his fourth wife his niece Agrippina, a woman as criminal as any of her predecessors. She prevailed upon him to set aside his own son Britannicus in favour of Nero, her son by a former marriage; and in 44, to make Nero's position secure, she put the emperor to death by poison. The apotheosis of Claudia was the subject of a lampoon by Seneca called *apo lokomumiosis*, the "pumpkinification" of Claudia.

Claudius was a prolific writer, chiefly on history, but his works are lost. He wrote (in Greek) a history of Carthage and a history of Etruria: (in Latin) a history of Rome from the death of Caesar, an autobiography, and an essay in defence of Cicero against the attacks of Asinius Gallus. He also introduced three new letters into the Latin alphabet: ọ for the consonantal V, ʃ for BS and PS, ʃ for the intermediate sound between I and U.

**Authorities.—**Ancient: the *Annals* of Tacitus, Suetonius and Dio Cassius. Modern: H. Lehmann, *Claudius und seine Zeit*, with introductory chapter on the ancient authorities (1858); Lucien Double, *L'Empereur Claude* (1876); A. Ziegler, *Die politische Seite der Regierung des Kaisers Claudius* (1885); H. F. Pelham in *Quarterly Review* (April 1908), where certain administrative and political changes introduced by Claudia, for which he was attacked by his contemporaries, are discussed and defended; Mervale, *Hist. of the Romans under the Empire*, chs. 49, 50; H. Schiller, *Geschichte der römischen Kaiserzeit*, i. pt. 1; H. Furneaux's ed. of the *Annals of Tacitus* (introduction).

**CLAUDIUS,** the name of a famous Roman gens. The by-form *Clodius,* in its origin a mere orthographical variant, was regularly used for certain Claudia in later republican times, but otherwise the two forms were used indifferently. The gens contained a patrician and a plebeian family; the chief representatives of the former were the Pulchri, of the latter the Marcelli (see *Marcellus*). The following members of the gens deserve particular mention.

1. **APPIDUS SABINIUS INREGILLENSIUS, or REGILLENSIUS, CLAUDIUS,** so called from Regillum (or Regilli) in Sabine territory, founder of the Claudian gens. His original name was Attus or Attius Claudia. About 504 B.C. he settled in Rome, where he and his followers formed a tribe. In 495 he was consul, and his cruel enforcement of the laws of debtor and creditor, in opposition to his kinsman colleague, P. Servilius Priscus, was one of the chief causes of the "cessation" of the plebs to the Sacred Mount. On several occasions he displayed his hatred of the people, although it is stated that he subsequently played the part of mediator.

2. **CLAUDIUS, APPIDUS, surnamed CRASSUS, a Roman patrician, consul in 471 and 451 B.C., and in the same and following year one of the decemvirs. At first he was conspicuous for his aristocratic pride and bitter hatred of the plebeians. Twice they refused to fight under him, and fled before their enemies. He retaliated by decimating the army. He was banished, but soon returned, and again became consul. In the same year (451) he was made one of the decemviri who had been appointed to draw up a code of written laws. When it was decided to elect decemvirs for another year, he who had formerly been looked upon as the champion of the aristocracy, suddenly came forward as the friend of the people, and was himself re-elected together with several plebeians. But no sooner was the new body in office, than it treated both patricians and plebeians with equal violence, and refused to resign at the end of the year. Matters were brought to a crisis by the affair of Virginia. Enamoured of the beautiful daughter of the plebeian centurion Virginius, Claudia attempted to seize her by an abuse of justice. One of his clients, Marcus Claudia, swore that she was the child of a slave belonging to him, and had been stolen by the childless wife of the centurion. Virginius was summoned from the army, and on the day of trial was present to expose the conspiracy. Nevertheless, judgment was given according to the evidence of Marcus, and Claudia commanded Virginius to be given up to him. In despair, her father seized a knife from a neighbouring stall and plunged it in her side. A general insurrection was the result; and the people seceded to the Sacred Mount. The decemvirs were finally compelled to resign and Appius Claudia died in prison, either by his own hand or by that of the executioner. For a discussion of the character of Appius Claudia, see Mommsen's appendix to vol. i. of his *History of Rome.* He holds that Claudia was never the leader of the patrician party, but a patrician demagogue who ended by becoming a tyrant to patricians as well as plebeians. The decemvirate, one of the triumphs of the plebs, could hardly have been abolished by that body, but would naturally have been overthrown by the patricians. The revolution which ruined Claudia was a return to the rule of the patricians represented by the Horatii and Valerii.

Livy iii. 32-58; Dion. Halie. x. 59. xi. 3.

3. **CLAUDIUS, APPIDUS, surnamed CAECUS, Roman patrician and author. In 312 B.C. he was elected censor without having passed through the office of consul. His censorship—which he retained for five years, in spite of the lex Aemilia which limited the tenure of that office to eighteen months—was remarkable for the actual or attempted achievement of several great constitutional changes. He filled vacancies in the senate with men of low birth, in some cases even the sons of freedmen (Diod. Sic. xx. 36; Livy ix. 30; Suetonius, *Claudius*, 24). His most important political innovation was the abolition of the old free birth, free hold basis of suffrage. He enrolled the freedmen and their descendants in the senatorial and in the tribes, and, instead of assigning them to the four urban tribes, he distributed them through all the tribes and thus gave them practical control of the elections. In 304, however, Q. Fabius Rullianus limited the landless and poorer freedmen to the four urban tribes, thus nullifying the effect of Claudia's arrangement. Appius Claudia transferred the charge of the public worship of Hercules in the Forum Boarium from the Petitan gens to a number of public slaves. He further invaded the exclusive rights of the patricians by directing his secretary Gnaeus Flavius (whom, though a freedman, he made a senator) to publish the *legis actiones* (methods of legal practice) and the list of *dies fasti* (or days on which legal business could be transacted). Lastly, he gained enduring fame by the construction of a road and an aqueduct, which—a thing unheard of before—he called by his own name (Livy ix. 29; Frontinus, *De Aquis*, 153; Diod. Sic. xx. 36). In 307 he was elected consul for the first time. In 298 he was interned in 296, as consular, by the army in Samnium, and although, with his colleague, he gained a victory over the Etruscans and Samnites, he does not seem to have specially distinguished himself as a soldier (Livy x. 10). Next year he was praetor, and he was once dictator. His character, like his namesake the decemvir's, is not easy to define. In spite of his political reforms, he opposed the admission of the plebeians to the consulship and priestly offices; and, although these reforms might appear to be democratic in character and calculated to give preponderance to the lowest class of the people, his probable aim was to strengthen the power of the magistrates (and lessen that of the senate) by founding it on the popular will, which would find its expression in the urban inhabitants and could be most easily influenced by the magistrate. He was already blind and too feeble to walk, when Cines, the minister of Pyrrhus, visited him, but so vigorously did he oppose every concession that all the eloquence of Cines was in vain, and the Romans forgot past misfortunes in the inspiration of Claudius's patriotism (Livy x. 13; Justin xviii. 2; Plutarch, *Pyrrhus*, 19). The story of his blindness, however, may be merely a method of
CLAUDIUS, M. A.—CLAUSEL

accounting for his cognomen. Tradition regarded it as the punishment of his transference of the cult of Hercules from the Pottit.

Appius Claudius Cæcus is also remarkable as the first writer mentioned in Roman literature. His speech against peace with Pyrrhus was the first that was transmitted to writing, and thereby laid the foundation of the art of composition. He was the author of a collection of aphorisms in verse mentioned by Cicero (of which a few fragments remain), and of a legal work entitled De Usurpationibus. It is very likely also that he was concerned in the drawing up of the Legis Actiones published by Flavius. The famous dictum “Every man is the architect of his own fortune” is attributed to him. He also interested himself in grammatical questions, distinguished the two sounds R and S in writing, and did away with the letter Z.

See Mannsman’s appendix to his Roman History (vol. i.); treatises by V. Siebert and F. Gerlach (1872), dealing especially with the censorship of Claudius.

4. CLAUDIUS, PUBLIUS, surnamed Pulcher, son of (3). He was the first of the gens who bore this surname. In 249 he was consul and appointed to the command of the fleet in the first Punic War. Instead of continuing the siege of Lilybaemon, he decided to attack the Carthaginians in the harbour of Drepanum, and was completely defeated by the Carthaginians, which he could not do before the battle. “Let them drink then,” said the consul, and ordered them to be thrown into the sea. Having been recalled and ordered to appoint a dictator, he gave another instance of his high-handedness by nominating a subordinate official, M. Claudius Glicia, but the nomination was at once overruled. Claudius himself was accused of high treason and heavily fined. He had to pay 246, in which year his sister Claudia was fined for publicly expressing a wish that her brother Publius could rise from the grave to lose a second fleet and thereby diminish the number of the people. He was suspected of having committed suicide.

Liv. Epit., 19; Polybius i. 49; Cicero, De Divinatione, i. 16, ii. 8; Valerius Maximus i. 4, viii. 1.

5. CLAUDIUS, APPIUS, surnamed Pulcher, Roman statesman and author. He served under his brother-in-law Lucullus in Asia (22 B.C.) and was commissioned to deliver the ultimatum to Tigranes, which gave him the choice of war with Rome or the surrender of Mithradates. He was praetor in 56 B.C., praetor in Sardinia, and in 54 consul with L. Domitius Ahenobarbus. Through the influence of Pompey, he became reconciled to Cicero, who had been greatly offended because Claudius had indirectly opposed his return from exile. In this and certain other transactions Claudius seems to have acted from avaricious motives,—a result of his early poverty. In 53 he entered upon the governorship of Cilicia, in which capacity he seems to have been rapacious and tyrannical. During this period he carried on a correspondence with Cicero, whose letters to him form the third book of the Epistolae ad Familiales. Claudius resented the appointment of Cicero as his successor, avoided meeting him, and even issued orders after his arrival in the province. On his return to Rome Claudius was impeached by P. Cornelius Dolabella on the ground of having violated the sovereign rights of the people. This led him to make advances to Cicero, since it was necessary to obtain witnesses in his favour from his old province. He was acquitted, and a charge of bribery against him also proved unsuccessful. In 50 he was censor, and expelled many of the members of the Senate, amongst them the historian Sallust on the ground of immorality. His connexion with Pompey brought upon him the enmity of Caesar, at whose march on Rome he fled from Italy. Having been appointed by Pompey to the command in Greece, in obedience to an ambiguous oracle he crossed over to Euboea, where he died about 48, before the battle of Pharsalus. Claudius was of a distinctly religious turn of mind, as is shown by the interest he took in sacred buildings (a temple at Eleusis, the sanctuary of Amphiarous and Orpheus). He wrote a work on augury, the first book of which he dedicated to Cicero. He was also extremely superstitious, and believed in invocations of the dead. Cicero had a high opinion of his intellectual powers, and considered him a great orator (see Orelli, Onomasticon Romanum).

A full account of all the Claudii will be found in Pauly-Wissowa’s Realencyclopädie der classischen Altertumswissenschaft, ii. 2 (1889).

CLAUDIUS, MARCUS AURELIUS, surnamed Gothicus, Roman emperor A.D. 168–270, belonged to an obscure Illyrian family. On account of his military ability he was placed in command of an army by Decius; and Valerian appointed him general on the Illyrian frontier, and ruler of the provinces of the lower Danube. During the reign of Gallienus, he was called to Italy in order to crush Aureolus; and on the death of the emperor (268) he was chosen as his successor, in accordance, it was said, with his express desire. Shortly after his accession he routed the Alamanni on the Lacus Benacus (some doubt is thrown upon this); in 269 a great victory over the Goths at Naisus in Moesia gained him the title of Gothicus. In the following year he died of the plague at Sirnium, in his fifty-sixth year. He enjoyed great popularity, and appears to have been a man of ability and character.

His life was written by Trebellius Pollio, one of the Scriptores Historiae Augustae; see also Zosimus i. 40–43, the histories of Th. Bernhardt and H. Schiller, and special dissertations by A. Ducker on the life of Claudius (1868) and the defeat of the Alamanni (Annalen der phil. hist. Gesellschaft der Natur- und Altertumskunde, 1870); Homo, De Claudio Gothico (1900); Pauly-Wissowa, Realencyclopaedie, ii. 2458 ff. (Henzac).

CLAUDIUS, MATTHIAS (1740–1815), German poet, otherwise known by the name of Plume of Asmus, was born on 15th of August 1740 at Reinfeld, near Lübeck, and studied at Jena. He spent the greater part of his life in the little town of Wandsbeck, near Hamburg, where he earned his first literary reputation by editing from 1771 to 1775, a newspaper called the Wandsbecker Bote (Wandsbeck Messenger), in which he published a large number of prose essays and poems. They were written in pure and simple German, and appealed to the popular taste; in many there was a vein of extravagant humour or even burlesque, while others were full of quiet meditations and solemn sentiment.

In his later days, perhaps through the influence of Klopstock, with whom he had formed an intimate acquaintance, Claudius became strongly pietistic, and the graver side of his nature showed itself. In 1814 he removed to Hamburg, to the house of his son-in-law, the publisher Friedrich Christoph Perthes, where he died on the 21st of January 1815.

Claudius’s collected works were published under the title of Asmus omnia sua secum portans, oder Sämtliche Werke des Wandsbecker Botes (8 vols., 1775–1821; 13th edition, by C. Redlich, 2 vols., 1843). His biography has been written by Wilhem Herlet (4th ed., 1878). See also M. Schneider in, M. Claudius, seine Weltanschauung und Lebensweisenheit (1898).

CLAUSEL (more correctly Clauzel), BERTRAND, COUNT (1772–1842), marshal of France, was born at Mirepoix (Ariège) on the 12th of December 1772, and served in the first campaign of the French Revolutionary Wars as one of the volunteers of 1791. In 1795, having distinguished himself repeatedly in the war against the Austrians, he was placed in command of the eastern Pyrenees (1793–1794), Clausel was made a general of brigade. In this rank he served in Italy in 1798 and 1799, and in the disastrous campaign of the latter year he won great distinction at the battles of the Tribbia and of Novi. In 1802 he served in the expedition to S. Domingo. He became a general of division in December 1802, and after his return to France he was in almost continuous military employment there until in 1806 he was sent to the army of Naples. Soon after this Napoleon made him a grand officer of the Legion of Honour. In 1808–1809 he was with Marmont in Dalmatia, and at the close of 1809 he was appointed to a command in the army of Portugal under Masséna.

Clausel took part in the Peninsula campaigns of 1808 and 1811, including the Torres Vedras campaign, and under Marmont he did excellent service in re-establishing the discipline, efficiency and mobility of the army, which had suffered severely in the retreat from Torres Vedras. In the Salamanca campaign (1812) the result of Clausel’s work was shown in the marching powers
CLAUSEN—CLAUSEWITZ

of the French, and at the battle of Salamanka, Clause, who had succeeded to the command on Marmont being wounded, and had himself received a severe wound, drew off his army with the greatest skill, the retreat the Burgos being conducted by him in such a way that the Prussians failed to make the slightest impression, and had themselves in the end to retire from the siege of Burgos (1812). Early in 1813 Clause was made commander of the Army of the North in Spain, but he was unable to avert the great disaster of Vittoria. Under the supreme command of Soult he served through the rest of the Peninsular War without varying distinction. On the first restoration in 1814 he submitted unwillingly to the Bourbons, and when Napoleon returned to France, he hastened to join him. During the Hundred Days he was in command of an army defending the Pyrenean frontier. Even after Waterloo he long refused to recognize the restored government, and he escaped to America, being condemned to death in absence. He took the first opportunity of returning to aid the Liberals in France (1820), sat in the chamber of deputies from 1827 to 1830, and after the revolution of 1830 was at once given a military command. At the head of the army of Alsace, Clause made a successful campaign, but the French and English had then acquired the habit of intervention, which desired to avoid complications in Algeria. At the same time he was made a marshal of France (February 1831). For some four years thereafter he urged his Algerian policy upon the chamber of deputies, and finally in 1835 was reappointed commander-in-chief. But after several victories, including the taking of Mascara in 1835, the marshal met with a severe repulse at Constantine in 1836. A change of government in France was primarily responsible for the failure, but public opinion attributed it to Clause, who was recalled in February 1837. He thereupon retired from active service, and, after vigorously defending his conduct before the deputies, he ceased to take part in public affairs. He lived in complete retirement up to his death at Securrieu (Garonne) on the 21st of April 1842.

CLAUSEN, GEORGE (1827– ). English painter, was born in London, the son of a decorative artist. He attended the design classes at the South Kensington school from 1840–43 with great success. He then worked in the studio of Edwin Long, R.A., and subsequently in Paris under Bougieruan and Robert-Fleury. He became one of the foremost modern painters of landscape and of peasant life, influenced to a certain extent by the impressionists with whom he shared the view that light is the real subject of landscape art. His pictures excel in rendering the appearance of things under flickering outdoor sunlight, or in the shady shelter of a barn or stable. His “Girl at the Gate” was acquired for the nation by the Chantrey Trustees and is now at the National Gallery of British Art (Tate Gallery). He was elected a associate of the Royal Academy in 1865, and as professor of painting gave a memorable series of lectures to the students of the schools,—published as Six Lectures on Painting (1904) and Aims and Ideals in Art (1906).

CLAUSEWITZ, KARL VON (1780–1813). Prussian general and military writer, was born at Burg, near Magdeburg, on the 1st of June 1780. His family, originally Polish, had settled in Germany at the end of the previous century, caring that they should become a nation, he was appointed to the Rhine cavalry in 1793–1794, receiving his commission at the siege of Mainz. On his return to garrison duty he set to work so zealously to remedy the defects in his education caused by his father’s poverty, that in 1801 he was admitted to the Berlin Academy for young officers, then directed by Scharnhorst. Scharnhorst, attracted by his pupil’s industry and force of character, paid special attention to his training, and profoundly influenced the development of his mind. In 1803, on Scharnhorst’s recommendation, Clausewitz was made “adjutant” (aide-de-camp) to Prince August, and he served in this capacity in the campaign of Jena (1806), being captured along with the prince by the French at Frenzla. A prisoner in France and Switzerland for the next two years, he returned to Prussia in 1808; and for the next three years, as a departmental chief in the ministry of war, as a teacher in the military school, and as military instructor to the crown prince, he assisted Scharnhorst in the famous reorganization of the Prussian army. In 1810 he married the countess Marie von Brühl.

On the outbreak of the Russian war in 1812, Clausewitz, like many other Prussian officers, took service with his country’s nominal enemy. This step he justified in a memorial, published for the first time in the Leben Gneisenau’s by Pertz (Berlin, 1868). At first adjutant to General Phull, who had himself been a Prussian officer, he served later under Pahlen at Witepsk and Smolensk, and from the final Russian position at Kaluga he was sent to the army of Wittgenstein. It was Clausewitz who negotiated the convention of Tauroggen, which separated the cause of Yorck’s Prussians from that of the French, and began the War of Liberation (see Yorck von Wartenburg; also Blumenthal’s Die Konvention von Tauroggen, Berlin, 1901). As a Russian officer he superintended the formation of the Landwehr of East Prussia (see Stein, Baron vom), and in the campaign of 1813 served as chief of staff to Count Wallmoden. He conducted the fight at Göhrde, and after the armistice, with Gneisenau’s permission, published an account of the campaign (Der Feldzug von 1813 bis zum Waffenstillstand in der Zeit 1813). This was long attributed to Clausewitz himself. After the peace of 1814 Clausewitz re-entered the Prussian service, and in the Waterloo campaign was present at Ligny and Wavre as General Thielsman’s chief of staff. This post he retained till 1818, when he was promoted major-general and appointed director of the Allgemeine Kriegsschule. Here he remained till in 1830 he was made chief of the 3rd Artillery Inspection at Breslau. Next year he became chief of staff to Field-marshall Gneisenau, who commanded an army of observation on the Polish frontier. After the dissolution of this army Clausewitz returned to his army duties; but on the 18th of November 1831 he died at Breslau of cholera, which had proved fatal to his chief also, and a little previously, to his old Russian commander Diebitsch on the other side of the frontier.

His collected works were edited and published by his widow, who was aided by some officers, personal friends of the general. In the history: Of the two volumes of Hinterlassene Werke über Krieg und Kriegführung (Berlin, 1832–37, later edition called Clausewitz’s Gesammte Werke, Berlin, 1874) the first three contain Clausewitz’s masterpiece, Vom Kriege, an exposition of the philosophy of war which is absolutely unrivalled. He produced no “system” of strategy, and his critics styled his work “negative” and asked “Qu’est-ce qu’il fendre?” What he had “founded” was that modern strategy which, by its hold on the Prussian mind, carried the Prussian army to victory in 1866 and 1870 over the “systematic” strategists Krismanic and Bazaine, and his philosophy of war became, not only in Germany but in many other countries, the essential basis of all serious study of the art of war. The English and French translations (Graham, On War, London, 1853; Neuen, La Guerre, Paris, 1849–1852; or Vatry, Théorie de la grande guerre, Paris, 1860), with the German original, place the work at the disposal of students of most nationalities. The remaining volumes deal with military history: vol. 1, the Italian campaign of 1796–97; vol. 5 and 6, the campaigns of 1799 and 1800 in Switzerland and Italy; vol. 7, the years of 1812, 1813 to the armistice, and 1814; vol. 8, the Waterloo Campaign; vol. 9 and 10, papers on the campaigns of Gustavus Adolphus, Turenne, Luxembourg, Münnich, John Sobieski, Frederick the Great, Ferdinand of Brunswick, &c. He also wrote Über das Leben und den Charakter von Scharnhorst (printed in Ranke’s Historisch-politischer Zeitchrift, 1832). A manuscript on the catastrophe of 1806 long remained unpublished. It was used by v. Höpfner in his history of that war, and eventually published by the Great General Staff in 1888 (French translation, 1903). Letters from Clausewitz to his wife were published in Zeitschrift für preussische Landesgeschichte (1876). His name is borne by the 28th Field Artillery regiment of the German army.

CLAUDIOUS, RUDOLF JULIUS EMANUEL (1822–1888), German physicist, was born on the 2nd of January by 1822 at Köslin, in Pomerania. After attending the Gymnasium at Stettin, he studied at Berlin University from 1840 to 1844. In 1845 he took his degree at Halle, and in 1850 was appointed professor of physics in the royal artillery and engineering school at Berlin. Late in the same year he delivered his inaugural lecture as Privatdocent in the university. In 1855 he became an ordinary professor at Zürich Polytechnic, accepting at the same time a professorship in the university of Zürich. In 1867 he moved to Würzburg as professor of physics, and two years later was appointed to the same chair at Bonn, where he died on the 24th of August 1888. During the Franco-German War he was at the head of an ambulance corps composed of Bonn students, and received the Iron Cross for the services he rendered at Vionville and Gravelotte. The work of Clausius, who was a mathematical physicist rather than an experimental physicist, was concerned with many of the most abstruse problems of molecular physics. By his restatement of Carnot’s principle he put the theory of heat on a truer and sounder basis, and he deserves the credit of having made thermodynamics a science; he established the second law of thermodynamics in a paper contributed to the Berlin Academy in 1850, in the well-known form, “Heat cannot of itself pass from a colder to a hotter body.” His results he applied to an exhaustive development of the theory of the steam-engine, laying stress in particular on the conception of entropy. The kinetic theory of gases owes much to his labours, Clerk Maxwell calling him its principal founder. It was he who raised it, on the basis of the dynamical theory of heat, to the level of a theory, and he carried out many numerical determinations in connexion with it, e.g. of the mean free path of a molecule. To Clausius also was due an important advance in the theory of electrolysis, and he put forward the idea that molecules in electrolytes are continually interchanging atoms, the electric force not causing, but merely directing, the interchange. This view found little favour until 1857, when it was taken up by S. A. Arrhenius, who made it the basis of the theory of electrolytic dissociation. In addition to many scientific papers he wrote Die Potentiel-Funktion und das Potential, 1864, and Abhandlungen über die mechanische Wärmetheorie, 1864–67.

CLAUSTHAL, or KLAUSTHAL, a town of Germany, in the Prussian Harz, lying on a bleak plateau, 1860 ft. above sea-level, 50 m. by rail W.S.W. of Halberstadt. Pop. (1903) 8,955. Clausthal is the chief mining town of the Upper Harz Mountains, and practically forms one town with Zellerfeld, which is separated from it by a small stream, the Zellbach. The streets are broad, opportunity for improvement having been given by fires in 1844 and 1854; the houses are mostly of wood. There is an Evangelical and a Roman Catholic church, and a gymnasion. Clausthal has a famous mining college with a mineralogical museum, and a dissectum. Its chief mines are silver and lead, but it also smelts copper and a little gold. Four or five sanatoria are in the neighbourhood. The museum of the Upper Harz is at Zellerfeld.

Clausthal was founded about the middle of the 12th century in consequence probably of the erection of a Benedicite monastery (closed in 1431), remains of which still exist in Zellerfeld. At the beginning of the 16th century the dukes of Brunswick made a new settlement here, and under their directions the mining, which had been begun by the monks, was carried on more energetically. The first church was built at Clausthal in 1527. In 1864 the control of the mines passed into the hands of the state.

CLAVECIN, the French for clavichord or harpsichord (Ger. Clavicytherium or Pianoforte; Sp. clavicordo; Ital. clavicembalo), a keyboard musical instrument in which the strings were plucked by means of a plectrum consisting of a quill mounted upon a jack.

See Pianoforte; Harpsichord.

CLAVICEMBALO, or GRAVICEMBALO (from Lat. clavis, key, and cymbalum, cymbal; Eng. clavicytherium, clavicembalum; Flemish, clavinsbal; Span. claviscimbano), a keyboard musical instrument with strings plucked by means of small quill or leather plectra. “Cymbal” (Gr. κύμβαλλον, from κύμβας, a hollow vessel) was the old European term for the dulcimer, and hence its place in the formation of the word clavicembalo.

See Pianoforte; Spinet; Virginal.

CLAVIDIA, or CLAVICHORD (Fr. manuichorde; Ger. Clavi- chord; Ital. manicord; Span. manicordo), a medieval stringed keyboard instrument, a forerunner of the pianoforte (p.r.), its strings being set in vibration by a bow freely or a brass bracket instead of a hammer as in the modern instrument. The clavichord, derived from the dulcimer by the addition of a keyboard, consisted of a rectangular case, with or without legs, often very elaborately ornamented with paintings and gilding. The earliest instruments were small and portable, being placed upon a table or stand. The strings, of finely drawn brass, steel or iron wire, were stretched almost parallel with the keyboard over the narrow belly or soundboard resting on the soundboard bridges, often three in number, and wound as in the piano round wrest or tuning pins set in a block at the right-hand side of the soundboard and attached at the other end to hitch pins. The bridges served to direct the course of the strings and to conduct the sound waves to the soundboard. The scaling, or division of the strings determining their vibrating length, was effected by the position of the tangents. These tangents, small wedge-shaped blades of brass, beaten out at the top, were inserted in the end of the arm of the keys. As the latter were depressed by the fingers the tangents rose to strike the strings and stop them at the proper length from the bridge. Thus the string was set in vibration between the point of impact and the bridge, just as long as the key was pressed down. The key being released, the vibrations were instantly stopped by a list of cloth acting as damper and interwoven among the strings behind the line of the tangents.

There were two kinds of clavichords—the fretted or unison and the fretless or bund-frei. The term “fretted” was applied to those clavichords which, instead of being provided with a string or set of strings in unison for each note, had one set of strings acting for three or four notes, the arms of the keys being twisted in order to bring the contact of the tangent into the acoustically correct position under the string. The “fretless” were chromatically-scaled instruments. The first bund-frei clavichord is attributed to Daniel Faber of Crailsheim in Saxony. The importance of the new construction increased the size of the instrument, each pair of unison strings requiring a key and tangent of its own, and led to the introduction of the system of tuning by equal temperament upheld by J. S. Bach. Clavichords were made with pedals.

The tone of the clavichord, extremely sweet and delicate, was characterized by a tremulous hesitancy, which formed its great charm while rendering it suitable only for the private music room or study. Between 1883 and 1803 renewed attention was drawn to the instrument by A. J. Hipkin’s lectures and recitals on keyboard instruments in London, Oxford and Cambridge; and Arnold Dolmetsch reintroduced the art of making clavichords in 1894.

CLAVICYTHERIUM, a name usually applied to an upright spinet (p.r.), the soundboard and strings of which were vertical instead of horizontal, being thus perpendicular to the keyboard; but it would seem that the clavicytherium proper is distinct from the upright spinet in that its strings are placed horizontally. In the early clavicytherium there was, as in the spinet, only one string (of gut) to each key, set in vibration by means of a small quill or leather plectrum mounted on a jack which acted as in the spinet and harpsichord (p.r.). The clavicytherium or keyed

---

1 The words clavicorde, clavicordo and clavicordio, respectively French, Italian and Spanish, were applied to a different type of instrument, the spinet (p.r.).

CLAVIE—CLAVIVO, R. G. DE

cythera or creta, names which in the 14th and 15th centuries had been applied somewhat indiscriminately to instruments having strings over a soundboard and plucked by fingers or plectrum, was probably of Italian 1 or possibly of south German origin. Sebastian Virdung, writing early in the 16th century, describes the clavicymherium as a new invention, having gut strings, and gives an illustration of it. (See PIANOFORTE.) A certain amount of uncertainty exists as to its exact construction, due to the extreme rarity of unrestored specimens extant, and to the almost total absence of trustworthy practical information.

In a unique specimen with two keyboards dating from the 16th or 17th century, which is in the collection of Baron Alexandre Kraus, 2 what appears to be vibrating strings stretched over a soundboard perpendicular to the keyboard are in reality the wires forming part of the mechanism of the action. The arrangement of this mechanism is the distinctive feature of the clavicymherium, for the wires, unlike the strings of the upright spinet, increase in length from left to right, so that the upright harp-shaped back has its higher side over the treble of the keyboard instead of over the bass. The vibrating strings of the clavicymherium in the Kraus Museum are stretched horizontally on two boards fixed on the other. The first, serving for the lower register, is of the well-known trapezoid shape and lies over the keyboards; it has 30 wire strings in pairs of unisons corresponding to the 15 lowest keys. The second psalterium resembles the kanoon of the Arabs, and has 36 strings in courses of 3 unisons corresponding to the next 12 keys, and 88 very thin strings in courses of 4, completing the 49 keys; the compass thus has a range of four octaves from C to C. The quills of the jacks belonging to the two keyboards are of different length and thickness. The jacks, which work as in the spinet, are attached to the perpendicular wires, disposed in parallel rows, one for each keyboard.

There is a very fine specimen of the so-called clavicymherium (upright spinet) in the Donaldson museum of the Royal College of Music, London, acquired from the Correr collection at Venice in 1883. 4 The instrument is undated, but A. J. Hipkins 5 placed it early in the 16th or even at the end of the 15th century. There is German writing on the inside of the back, referring to some agreement at Ulm. The case is of pine-wood, and the natural keys of box-wood. The jacks have the early steel springs, and in 1883 traces were found in the instrument of original brass plelta, all of which points to a very early date.

A learned Italian, Nicolo Vicentino, 6 living in the 16th century, describes an archicimbalo of his own invention, at which the performer had to stand, having four rows of keys designed to obtain a complete mesotonic pure third tuning. This was an attempt to reintroduce the ancient Greek musical system. This instrument was probably an upright harpsichord or clavicembalo.

For the history of the clavicymherium considered as a forerunner of the pianoforte see PIANOFORTE.

CLAVIE, BURNING THE, an ancient Scottish custom still observed at Burghhead, a fishing village on the Moray Firth, near Forres. The "clavie" is a bonfire of casks split in two, lighted on the 13th of January, corresponding to the New Year of the old calendar. One of these casks is joined together again by a huge nail (Lat. clavis; hence the term). It is then filled with tar, lighted and carried flaming round the village and finally up to a headland upon which stands the ruins of a Roman altar, locally called "the Douro." It here forms the nucleus of the bonfire, which is built up of split casks. When the burning tar-barrel falls in pieces, the people scramble to get a lighted

1 Meserene, Harmonie universelle (Paris, 1630), p. 113, calls the clavicymherium "une nouvelle forme d'épinette dont on use en Italie," and states that the action of the jacks and levers is parallel from back to front.

piece with which to kindle the New Year's fire on their cottage hearth. The charcoal of the clavie is collected and is put in pounds of the cottage chimneys, to keep spirits and witches from coming down.

CLAVIÈRE, ÉTIENNE (1735—1793), French financier and politician, was a native of Geneva. As one of the democratic leaders there he was obliged in 1782 to take refuge in England, upon the armed interference of France, Sardinia and Berne in favour of the aristocratic party. There he met other Swiss, among them Marat and Étienne Dumont, but their schemes for a new Geneva in Ireland—which the government favoured—were given up when Necker came to power in France, and Clavière, with most of his comrades, went to Paris. There in 1789 he and Dumont allied themselves with Mirabeau, secretly collaborating for him on the Courrier de Provence and also in preparing the speeches which Mirabeau delivered as his own. It was mainly by his use of Clavière that Mirabeau sustained his reputation as a financier. But Clavière also published some pamphlets under his own name, and through these and his friendship with J. P. Brissot, whom he had met in London, he became minister of finance in the Girondist ministry, from March to 24 July, 1792. After the fall of August he was again given charge of the finances in the provisional National council, though with but indifferent success. He shared in the fall of the Girondists, was arrested on the 2nd of June 1793, but somehow was left in prison until the 8th of December, when, on receiving notice that he was to appear on the next day before the Revolutionary Tribunal, he committed suicide.

CLAVIJO, RUY GONZALEZ DE (d. 1412), Spanish traveller of the 15th century, whose narrative is the first important one of its kind contributed to Spanish literature, was a native of Madrid, and belonged to a family of some antiquity and position. On the return of the ambassadors Pelayo de Sotomayor and Hernan Sanchez de Palauellos from the court of Timur, Henry III. of Castile determined to send another embassy to the new lord of Western Asia, and for this purpose he selected Clavijo, Gomez de Salazar (who died on the outward journey), and a master of theology named Fray Alonso Paez de Santa Maria. They sailed from St Mary Fort near Cadiz on the 2nd of May 1403, touched at the Balearic Isles, Gatta and Rhodes, spent some time at Constantinople, sailed along the south coast of the Black Sea to Trebizond, and proceeded inland by Erzerum, the Ararat region, Tabriz, Sultanieh, Teheran and Meshed, to Samarkand, where they were well received by the conqueror. Their return was at last accomplished, in part after Timur's death, and with countless difficulties and dangers, and they landed in Spain on the 1st of March 1406. Clavijo proceeded at once to the court, at that time in Alcalca de Henares, and served as chamberlain till the king's death (in the spring of 1406—1407); he then returned to Madrid, and lived there in opulence till his own death on the 2nd of April 1412. He was buried in the chapel of the monastery of St Francis, which he had rebuilt at great expense.

There are two leading MSS. of Clavijo's narrative—(a) London, British Museum, Additional MSS., 16,613 fols. 1, n. 125, v. (b) Madrid, National Library, 1418 and two old editions of the original Spanish—(1) by Gonzalo Argote de Molina (Seville, 1852). (2) by Antonio de Sancha (Madrid, 1782), both having the misleading titles, apparently invented by Molina, of Historia del gran Tamerlan, and Historia de Tamerlan (the latter at the beginning of the text itself); a better sub-title is added, viz. Historia y narracion del viaje y relacion de la embasada que Ruy Gonzales de Clavijo le hizo. Both editors, and especially Sancha, supply general explanatory dissertations. The Spanish text has also been published, translated into Russian, in vol. xxviii. (pp. 1-455) of the Publications of the Russian Imperial Academy of Sciences (Section of Russian Language, &c.), edited by I. I. Sreznevski (1881). An English version, by Sir Clements Markham, was issued by the Hakluyt Society (London, 1892), and also in the Annals of the Foreign and Colonial Commission of the British Empire (1873—90), and in Sreznevski's Annales Instituti Russici in the Russian edition of 1881. A short account of Clavijo's life is given by Alvarez y Baena in the Hijos de Madrid, vol. ix. See also C. R. Beazley, Dawn of Modern Geography, iii. 332-56.
CLAVIJO Y FAJARDO—CLAY, HENRY

CLAVIJO Y FAJARDO, José (1730-1866), Spanish publicist, was born at Lanzarote (Canary Islands) in 1730. He settled in Madrid, became editor of El Pensador, and by his campaign against the public performance of autos sacramentales secured their prohibition in 1765. In 1770 he was appointed director of the royal theatres, a post which he resigned in order to take up the editorship of the Mercurio histórico y político de Madrid; at the time of his death in 1806 he was secretary to the Cabinet of Natural History. He had in abundance the courage, perseverance and gift of pungent expression which form the equipment of the aggressive journalist, but his work would long since have been forgotten were it not that it put an end to a peculiarly national form of dramatic exposition, and that his love affair with one of Beaumarchais' sisters suggested the theme of Goethe's first publication, Clavigo.

CLAY, CASSIUS MARCELLUS (1802-1903), American politician, was born in Madison county, Kentucky, on the 16th of October 1810. He was the son of Green Clay (1752-1826), a Kentucky soldier of the war of 1812 and a relative of Henry Clay. He was educated at Centre College, Danville, Kentucky, and at Yale, where he graduated in 1821. Influenced to some extent by William Lloyd Garrison, he became an advocate of the abolition of slavery, and on his return to his native state, at the risk of social and political ostracism, he gave utterance to his belief. He studied law, but instead of practising devoted himself to a political career. In 1835, 1837 and 1840 he was elected as a Whig to the Kentucky legislature, where he advocated a system of gradual emancipation, and secured the establishment of a public school system, and a much-needed reform in the jury system. In 1841 he was defeated on account of his abolition views. In 1844 he delivered campaign speeches for Henry Clay throughout the North. In 1845 he established, at Lexington, Kentucky, an anti-slavery publication known as The True American, but in the same year his office and press were wrecked by a mob, and he removed the publication office to Cincinnati, Ohio. During this and the earlier period of his career his zeal and hot temper involved him in numerous personal encounters and several duels, in all of which he bore himself with a reckless bravery. In the Mexican War he served as a captain of a Kentucky company of militia, and was taken prisoner, while reconnoitring, during General Scott's advance on the City of Mexico. He left the Whig party in 1850, and as an anti-slavery candidate for governor of Kentucky polled 5000 votes. In 1856 he joined the Republican party, and wielded considerable influence as a Southern representative in its councils. In 1860 he was a leading candidate for the vice-presidential nomination. In 1861 he was sent by President Lincoln as minister to Russia; in 1862 he returned to America to accept a commission as major-general of volunteers, but in March 1863 he was reappointed to his former post at St Petersburg, where he remained until 1866. Disapproving of the Republican policy of reconstruction, he left the party, and in 1872 was one of the organizers of the Liberal-Republican revolt, and was largely instrumental in securing the nomination of Horace Greeley for the presidency. In the political campaigns of 1876 and 1880 he supported the Democratic candidate, but rejoined the Republican party in the campaign of 1884. He died at Whitehall, Kentucky, on the 22nd of July 1903. See his autobiography, The Life, Memoirs, Writings, and Speeches of Cassius Marcellus Clay (Cincinnati, 1860); and The Writings of Cassius Marcellus Clay (edited with a "Memoir" by Horace Greeley, New York, 1848).

CLAY, CHARLES (1801-1893), English surgeon, was born at Bredbury, near Stockport, on the 27th of December 1801. He began his medical education at Kinder Wood in Manchester (where he used to attend John Dalton's lectures on chemistry), and in 1821 went to Edinburgh to continue his studies there. Qualifying in 1823, he began a general practice in Ashton-under-Lyne, but in 1839 removed to Manchester to practise as an operative and consulting surgeon. It was there that, in 1842, he first performed the operation of ovariotomy with which his name is associated. On this occasion it was perfectly successful, and when in 1865 he published an analysis of 111 cases he was able to show a mortality of only slightly above 30%. Although his merits in this matter have sometimes been denied, his claim to the title "Father of Ovariometry" is now generally conceded, and it is admitted that he deserves the credit not only of having shown how that operation could be made a success, but also of having played an important part in the advance of abdominal surgery for which the 19th century was conspicuous. In spite of the claims of a heavy practice, Clay found time for the pursuit of geology and archaeology. Among the books of which he was the author were a volume of Geological Sketches of Manchester (1830) and a History of the Currency of the Isle of Man (1840), and his collections included over a thousand editions of the Old and New Testaments and a remarkably complete series of the silver and copper coins of the United States. He died at Poulton-le-Fylde, near Preston, on the 19th of September 1893.

CLAY, FREDERIC (1838-1889), English musical composer, the son of James Clay, M.P., who was celebrated as a player of the piano and a writer on that subject, was born in Paris on the 3rd of August 1813. He studied music under W. B. Molique in Paris and Moritz Hauptmann at Leipzig. With the exception of a few songs and two cantatas, The Knights of the Cross (1866) and Lalla Rookh (1877), the latter of which contained his well-known song "I'll sing thee songs of Araby," his compositions were all written for the stage. Clay's first public appearance was made with an opera entitled Court and Cottage, the libretto of which was written by Tom Taylor. This was produced at Covent Garden in 1862, and was followed by Constance (1865), Ages Ago (1869), and Princess Toto (1875), to name only three of many works which have long since been forgotten. The last two, which were written to libretti by W. S. Gilbert, are among Clay's most tuneful and most attractive works. He wrote part of the music for Babil and Bijou (1872) and The Black Crook (1873), both of which were produced at the Alhambra. He also furnished incidental music for a revival of Twelfth Night and for the production of James Albery's Oriana. His last works, The Merry Duchess (1883) and The Golden Ring (1883), the latter written for the reopening of the Alhambra, which had been burned to the ground the year before, showed an advance upon his previous work, and rendered all the more regrettable the stroke of paralysis which crippled his physical and mental energies during the last few years of his life. He died at Great Marlow on the 24th of November 1889.

CLAY, HENRY (1777-1852), American statesman and orator, was born in Hanover county, Virginia, on the 12th of April 1777, and died in Washington on the 29th of June 1852. Few public characters in the United States have been the subject of more heated controversy. His enemies denounced him as a pretender, a selfish intriguer, and an abandoned profligate; his supporters placed him among the sages and sometimes even among the saints. He was an arranger of measures and leader of political forces, not an originator of ideas and systems. His public life covered nearly half a century, and his name and fame rest entirely upon his own merits. He achieved his success despite the road of his life, the scars of his early instruction was but; he "read books," talked well, and so, after his admission to the bar at Richmond, Virginia, in 1797, and his removal next year to Lexington, Kentucky, he quickly acquired a reputation and a lucrative income from his law practice.

Thereafter, until the end of life, and in a field where he met, as either friend or foe, John Quincy Adams, Gallatin, Madison, Monroe, Webster, Jackson, Calhoun, Randolph and Benton, his political activity was wellnigh ceaseless. At the age of twenty-two (1799), he was elected to a constitutional convention in Kentucky; at twenty-six, to the Kentucky legislature; at twenty-nine, while yet under the age limit of the United States constitution, he was appointed to an unexpired term (1806-1807) in the United States Senate, where, contrary to custom, he at once plunged into business, as though he had been there all his life. He again served in the Kentucky legislature
CLAY, HENRY

(1808-1860), was speaker of its lower house, and achieved distinction by preventing an intense and widespread anti-British feeling from excluding education from the common law from the Kentucky code. A year later he was elected to another unexpired term in the United States Senate, serving in 1810-1811. At thirty-four (1811) he was elected to the United States House of Representatives and chosen speaker on the first day of the session. One of the chief sources of his popularity was his activity in Congress in promoting the war with Great Britain in 1812, while as one of the peace commissioners he reluctantly signed the treaty of Ghent on the 24th of December 1814. During the fourteen years following his first election, he was re-elected five times to the House and to the speakership; retiring for one term (1821-1823) to resume his law practice and retrieve his fortunes. He thus served as speaker in 1811-1814, in 1815-1820 and in 1823-1825. Once he was unanimously elected by his constituents, and once nearly defeated for having at the previous session voted to increase congressional salaries. He was a warm friend of the Spanish-American revolutionists (1818) and of the Greek insurgents (1824). From 1825 to 1830 he served as secretary of state in President John Quincy Adams's cabinet, and in 1831 he was elected to the United States Senate where he served until 1842, and after that to the vice-presidency until his death.

From the beginning of his career he was in favour of internal improvements as a means of opening up the fertile but inaccessible West, and was opposed to the abuse of official patronage known as "the spoils system." The most important of the national questions with which Clay was associated, however, were the various phases of slavery politics and protection to home industries. The most prominent characteristics of his public life were his predisposition to "compromises" and "pacifications" which generally failed of their object, and his passionate patriotic devotion to the Union.

His earliest championship of protection was a resolution introduced by him in the Kentucky legislature (1808) which favoured the wearing by its members of home-made clothes; and one in the United States Senate (April 1810), on behalf of home-grown and home-made supplies for the United States navy, but only to the point of making the nation independent of foreign supply. In 1816 he advocated the Dallas tariff, in which the duties ranged from 25 to 35 per cent on the products which could satisfy the home demand; the avowed purpose being to build up certain industries for safety in time of war. In 1824 he advocated high duties to relieve the prevailing distress, which he pictured in a brilliant and effective speech. Although the distress was caused by the reactionary effect of a disordered currency and the inflated prices of the war of 1812, he ascribed it to the country's dependence on foreign supply and foreign markets. Great Britain, he said, was a shining example of the wisdom of a high tariff. No nation ever flourished without one. He closed his principal speech on the subject in the House of Representatives with a glowing appeal in behalf of what he called "The American System." In spite of the opposition of Webster and other prominent statesmen, Clay succeeded in enacting a tariff which the people of the Southern states denounced as a "tariff of abominations." As it oversold the revenue, in 1832 he vigorously favoured reducing the tariff rates on all articles not competing with American products. His speech in behalf of the measure was for years a protection text-book; but the measure itself reduced the revenue which the country needed to pay such serious threats of nullification and secession in South Carolina, that, to prevent bloodshed and to forestall a free trade measure from the next Congress, Clay brought forward in 1833 a compromise gradually reducing the tariff rates to an average of 20%. To the Protectionists this was "like a crash of thunder in winter"; but it was received with such favour by the country generally, that its author was hailed as "The Great Pacifier," as he had been thirteen years before at the time of the Missouri Compromise (see below).

As, however, the discontent with the tariff in the South was only a symptom of the real trouble there—the sensitiveness of the slave-power,—Clay subsequently confessed his serious doubts of the policy of his interference.

He was only twenty-two, when, as an opponent of slavery, he vainly urged an emancipation clause for the new constitution of Kentucky, and he never ceased regretting that its failure put his state, in improvements and progress, behind its free neighbours. In 1820 he congratulated the new South American republics on having abolished slavery, but the same year the threats of the Southern states to destroy the Union led him to advocate the "Missouri Compromise," which, while keeping slavery out of all the rest of the territory acquired by the "Louisiana Purchase" north of Missouri's southern boundary line, permitted it in that state. Then, greeted with the title of "The Great Pacifier" as a reward for his success, he retired temporarily to private life, with a larger stock of popularity than he had ever had before. Although at various times he had helped to strengthen the law for the recovery of fugitive slaves, declining as secretary of state to aid Great Britain in the further suppression of the slave trade, and demanding the return of fugitives from Canada, yet he heartily supported the colonizing of the slaves in Africa, because slavery was the "deepest stain upon the character of the country," opposition to which could be expressed except by "boiling down the moral lights around," and "eradicating from the human soul the light of reason and the law of liberty." When the slave power became more aggressive, in and after the year 1831, Clay defended the right of petition for the abolition of slavery in the District of Columbia, and opposed Calhoun's bill forbidding the use of the mails to "abolition newspapers and documents. He was lukewarm toward recognizing the independence of Texas, lest it should aid the increase of slave territory, and generally favoured the freedom of speech and press as regards the question of slavery; yet his various concessions and compromises resulted, as he himself declared, in the abolitionists denouncing him as a slaveholder, and the slaveholders as an abolitionist. In 1839, only twelve months after opposing the pro-slavery demands, he prepared an elaborate speech, in order to set himself right with the South," which, before its delivery, received pro-slavery approval. While affirming that he was "no friend of slavery" he held abolition and the abolitionists responsible for the hatred, strife, disruption and carnage that menaced the nation. In response, Calhoun, and Clay denounced by Calhoun and the moral lights around, and "eradicating from the human soul the light of reason and the law of liberty." It was in reference to this speech that he made the oft-quoted remark that he "would rather be right than be president." While a candidate for president in 1844, he opposed in the "Raleigh letter" the annexation of Texas on many grounds except that of its increasing the slave power, thus displeaseing both the men of anti-slavery and those of pro-slavery sentiments. In 1847, after the conquest of Mexico, he made a speech against the annexation of that country or the acquiring of any foreign territory for the spread of slavery. Although in 1849 he again vainly proposed emancipation in Kentucky, he was unanimously elected to the United States Senate, where in 1850 he temporarily pacified both sections of the country by successfully offering, for the sake of the "peace, concord and harmony of these states," a measure or series of measures that became known as the "Compromise of 1850." It admitted California as a free state, organized Utah and New Mexico as Territories without reference or anxiety, and enacted a more efficient fugitive slave law. In spite of great physical weakness he made several earnest speeches in behalf of these measures to save the Union.

Another conspicuous feature of Clay's public career was his absorbing and rightful, but constantly ungratified, ambition to be president of the United States. His name in connexion therewith was mentioned comparatively early, and in 1824, with W. H. Crawford, Andrew Jackson, and John Quincy Adams, he was a candidate for that office. There being no choice by the people, and the House of Representatives having elected Adams, Clay was accused by Jackson and his friends of making a corrupt bargain whereby, in payment of his vote and influence
for Adams, he was appointed secretary of state. This made Jackson's lifelong enemy, and ever after kept Clay busy explaining and denying the allegation. In 1832 Clay was unanimously nominated for the presidency by the National Republicans; Jackson, by the Democrats. The main issue was the policy of continuing the United States Bank, which in 1811 Clay had opposed, but in 1816 and always subsequently warmly favoured. A majority of the voters approved of Jackson's fight against what Clay had once denounced as a dangerous and unconstitutional monopoly. Clay made the mistake of supposing that he could arouse popular enthusiasm for a moneyed corporation in its contest with the great military "hero of New Orleans." In 1830 he was a candidate for the Whig nomination, but by a secret ballot his enemies defeated him in the party convention, held in December of that year, and nominated William Henry Harrison. The result threw Clay into paroxysms of rage, and he violently complained that his friends always used him as their candidate when he was sure to be defeated, and betrayed him when he or any one could have been elected. In 1844 he was nominated by the Whigs against James K. Polk, the Democratic candidate. By an audacious fraud that represented him as an enemy, and Polk as a friend of protection, Clay lost the vote of Pennsylvania; and he lost the vote of New York by his own letter abating the force of his previous opposition to the annexation of Texas. Even his enemies felt that his defeat by Polk was almost a national calamity. In 1848, Zachary Taylor, a Mexican War hero, and hardly even a convert to the Whig party, defeated Clay for the nomination, Kentucky herself deserting her "favourite son."

Clay's quick intelligence and sympathy, and his irreproachable conduct in youth, explain his precocious prominence in public affairs. In his persuasiveness as an orator and his charming personality lay the secret of his power. He had early trained himself in the art of speech-making, in the forest, the field and even the barn, with horse and ox for audience. By contemporaries it was declared to be the finest musical instrument that they ever heard. His eloquence was in turn majestic, fierce, playful, insinuating; his gesticulation natural, vivid, large, powerful. In public he was of magnificent bearing, possessing the true oratorical temperament, the nervous exaltation that makes the orator feel and appear a superior being, transfixing his thought, passion and will into the mind and heart of the listener; but his imagination frequently ran away with his understanding, while his impetuous temper and ardent combativeness hurried him and his party into disadvantageous positions. The case, too, with which he exhorted men of vastly greater learning lured him from the task of intense and arduous study. His speeches were characterized by skill of statement, ingenious grouping of facts, fervent diction, and ardent patriotism; sometimes by biting sarcasm, but also by superficial research, half-knowledge and an unwillingness to reason a proposition to its logical results. In private, his never-failing courtesy, his agreeable manners, and a noble and generous heart for all who needed protection against the powerful or the lawless, endeared him to hosts of friends. His popularity was as great and as inextinguishable among his neighbours as among his fellow-citizens generally. He pronounced upon himself a just judgment when he wrote: "If any one desires to know the leading and paramount object of my public life, the preservation of this Union will furnish him the key."

CLAY (from O. Eng. clay, a word common in various forms to Teutonic languages, cf. Ger. Klei), commonly defined as a fine-grained, almost impalpable substance, very soft, more or less coherent when dry, plastic and retentive of water when wet; it is said to be "clay-ey" or "clayey" when it is crumbly, and consists essentially of hydrous aluminium silicate with various impurities. Of clay are formed a great number of rocks, which collectively are known as "clay-rocks" or "pelitic rocks" (from Gr. γύκος, clay), e.g. mudstone, shale, slate: these exhibit in greater or less perfection the properties above described according to their freedom from impurities. In nature, clays are rarely free from foreign ingredients, many of which can be detected with the unaided eye, while others may be observed by means of the microscope. The commonest impurities are:

1. Organic matter, humus, &c. (exemplified by clay-soils with an admixture of peat, oil shales, carbonaceous shales);
2. Fossils (such as plants in the shales of the Lias and Coal Measures, shells in clays of all geological periods and in fresh water marls);
3. Carbonate of lime (rarely altogether absent, but abundant in marls, cement-stones and argillaceous limestones);
4. Sulphide of iron, as pyrite or marcasite (when finely diffused, giving the clay a dark grey-blue colour, which weathers to brown—e.g., London Clay; also as nodules and concretions, e.g., Gaul); 5. Oxides of iron (staining the clay bright red when ferric oxide, red ochre; yellow when hydrous, e.g., yellow ochre); 6. Sand or detrital silica (forming loams, arenaceous clays, argillaceous sandstones, &c.). Less frequently present are the following:—rock salt (Triassic clays, and marls of Cheshire, &c.); gypsum (London Clay, Triassic clays); dolomite, phosphate of lime, vivianite (phosphate of iron), oxides of manganese, copper ores (e.g., Kupferschiefer), wavelite and amber. As the impurities increase in amount the clay rocks pass gradually into argillaceous sands and sandstones, argillaceous limestones and dolomites, shaly coals and clay ironstones.

Natural clays, even when most pure, show a considerable range of composition, and hence cannot be regarded as consisting of a single mineral; clay is a rock, and has that variability which characterizes all rocks. Of the essential properties of clay some are merely physical, and depend on the minute size of the particles. If any rock be taken (even a piece of pure quartz) and crushed to a very fine powder, it will show some of the peculiarities of clays; for example, it will be plastic, retentive of moisture, and impermeable to water, and will have the extent if the moist mass be kneaded, and then allowed to dry. It happens, however, that many rocks are not disintegrated to this extreme degree by natural processes, and weathering invariably accompanies disintegration. Quartz, for example, has little or no cleavage, and is not attacked by the atmosphere. It breaks up into fragments, which become rounded by attrition, but after they reach a certain minuteness are borne along by currents of water or air in a state of suspension, and are not further reduced in size. Hence sands are more coarse-grained than clays. A great number of rock-forming minerals, however, possess a good cleavage, so that when bruised they split into thin fragments; many of these minerals decompose somewhat readily, yielding secondary minerals, which are comparatively soft and have a scaly character, with eminently perfect cleavages, which facilitate splitting into exceedingly thin plates. The principal substances are mica (as muscovite and biotite), feldspar (kaolin, muscovite and chlorite). Kaolin and muscovite are formed principally after feldspars (the feldspars are the commonest minerals of all crystalline rocks); also from nepheline, leucite, scapolite and a variety of other rock-forming minerals. Chlorite arises from biotite, augite and hornblende. Serpentine, which may be fibrous or scaly, is a secondary product of olivine and certain pyroxenes. Clays consist essentially of the above ingredients (although serpentine is not known to take part in them to any extent, it is closely allied to chlorite). At the same time other substances are produced as decomposition goes on. They are principally finely divided quartz, epidote, zoisite, rutil, limonite, calcite, pyrites, and very small particles of these are rarely absent from natural clays. These fine-grained materials are at first mixed with broken and more or less weathered rock fragments and coarser mineral particles in the soil and subsoil, but by the action of wind and rain they are swept away and deposited in distant situations. "Loess" is a fine calcareous clay, which has been wind-borne, and subsequently laid down on the margins of dry steppes and deserts. Most clays are water-borne, having been carried from the surface of the land by
Rain and transported by the brooks and rivers into lakes or the sea. In this state the fine particles are known as “mud.” They are deposited where the currents are checked and the water becomes very still. If temporarily laid down in other situations they are ultimately lifted again and removed. A little clay, stirred up with water in a glass vessel, takes hours to settle, and even after two or three days some remain in suspension; in fact, it has been suggested that in such cases the clay forms a sort of “colloidal solution” in the water. Traces of dissolved salts, such as common salt, gypsum, or alum, greatly accelerate deposition. For these reasons the principal gathering places of fine pure clays are deep, still lakes, and the sea bottom at considerable distances from the shore. The coarser materials settle nearer the land, and the shallower portions of the sea floor are strewn with gravel and sand, except in occasional depressions and near the mouths of rivers where mud may gather. Farther out the great mud deposits begin, extending from 50 to 200 m. from the land, according to the amount of sediment brought in, and the rate at which the water deepens. A girdle of mud accumulations encircles all the continents. These sediments are fine and tenacious; their principal components, in addition to clay minerals, are small grains of quartz, zircon, tourmaline, hornblende, felspar and iron compounds. Their typical colour is blackish-blue, owing to the abundance of sulphuric acid hydrogen; when fresh they have a sulphurous odour, when weathered they are brown, as their iron is present as hydrous oxides (limonite, &c.). These deposits are tenanted by numerous forms of marine life, and the sulphur they contain is derived from decomposing organic matter. Occasionally water-laden plant debris is mingled with the mud. In a few places a red colour prevails, the iron being mostly oxidized; elsewhere the muds are green owing to abundant glauconite. Traced landwards the muds become more sandy, while on their outer margins they grade into the abysmal deposits, such as the globigerina ooze (see Oceanography). Near volcanoes they contain many volcanic minerals, and around coral islands they are often in large part calcareous.

Microporous sections of some of the more coherent clays and shales may be prepared by saturating them with calcium balsam by long boiling, and slicing the resultant mass in the same manner. In the finer varieties the muds contain abundant very small grains of quartz (about 0.01 to 0.05 mm. in diameter), with often felspar, tourmaline, zircon, epidote, rutile and more or less calcite. These may form more than one-third of an ordinary shale; the greater part, however, consists of still smaller scales of other minerals (0.01 mm. in diameter and less than this). Some of these are recognizable as pale yellowish and white mica; others seem to be chlorite, the remainder is perhaps kaolin, but, owing to the minute size of the flakes, they yield very indistinct reactions to polarized light. They are also often stained with iron oxide and organic substances, and in consequence their true nature is almost impossible to determine. It is certain, however, that the finer-grained rocks are richest in alumina, and in combined water; hence the inference is clear that kaolin or some other hydrous aluminium silicate is the dominating constituent. These results are confirmed by the mechanical analysis of clays. This process consists in finely pulverizing the soil or rock, and levigating it in vessels of water. A series of powders is obtained progressively finer according to the time required to settle the bottom of the vessel. The clay is held to include those particles which have less than 0.005 mm. diameter, and contains a higher percentage of alumina than any of the other ingredients.

As might be inferred from the differences they exhibit in other respects, clay rocks vary greatly in their chemical composition. Some of them contain much iron (yellow, blue and red clays); others contain abundant calcium carbonate (calcareous clays and marls). Pure clays, however, may be found almost quite free from these substances. Their silica ranges from about 50 to 40%, varying in accordance with the amount of quartz and alkali-felspar present. It is almost always more than would be the case if the rock consisted of kaolin mixed with muscovite. Alumina is high in the finer clays (18 to 30%), and they are the most aluminous of all sediments except bauxite. Magnesia is never absent, though its amount may be less than 4%; it is usually contained in minerals of the chlorite group, but partly also in dolomite. The alkalis are very interesting; often they form 5 or 10% of the whole rock; they indicate abundance of white micas or of undecomposed particles of felspar. Some clays, however, such as fireclays, contain very little potash or soda, while they are rich in alumina; and it is a fair inference that hydrated aluminous silicates, such as kaolin, are well represented in these rocks. There are, in fact, a few clays which contain about 45% of alumina, that is to say, more than in pure kaolin. It is probable that these are related to bauxite and certain kinds of latricle.

A few of the most important clay rocks, such as china-clay, brick-clay, red-clay and shale, may be briefly described here.

China-clay is white, friable and earthy. It occurs in regions of granite, porphyry and syenite, and usually occupies funnel-shaped cavities of no great superficial area, but of considerable depth. It consists of very fine scaly kaolin, larger, shining plates of white mica, grains of quartz and particles of semi-decomposed felspar, tourmaline, zircon and other minerals, which originally formed part of the granite. These clays result from the decomposition of the granite by acid vapours, which are discharged after the igneous rock has solidified (“fumarole or pneumatolytic action”). Fluorine and its compounds are often supposed to have been among the agencies which produce this change, but more probably carbonic acid played the principal rôle. The felspar decomposes into kaolin and quartz; its alkalis are for the most part set free and removed in solution, but are partly retained in the white mica which is constantly found in crude china-clays. Semi-decomposed varieties of the granite are known as china-stone. The kaolin may be washed away from its original site, and deposited in hollows or lakes to form beds of white clay, such as pipe-clay; in this case it is always more or less impure. Yellow and pinkish varieties of china-clay and pipe-clay contain a small quantity of oxide of iron. The best known localities for china-clay are Cornwall, Limoges (France), Saxony, Bohemia and China; it is found also in Pennsylvania, N. Carolina and elsewhere in the United States. Brick-clay includes all those varieties of clay which are very refractory to heat. They must contain little alkalis, lime, magnesia and iron, but some of them are comparatively rich in silica. Many of the clays which pass under this designation belong to the Carboniferous period, and are found underlying seams of coal. Either by rapid growth of vegetation, or by subsequent percolation of organic solutions, most of the alkalis and the lime have been carried away.

Any argillaceous material, which can be used for the manufacture of bricks, may be called a brick-clay. In England, Kimmeridge Clay, Lias clays, London Clay and pulverized shale and slate are all employed for this purpose. Each variety needs special treatment according to its properties. The true brick-clays, however, are superficial deposits of Pleistocene or Quaternary age, and occur in hollows, filled-up lakes and deserted stream channels. Many of them are derived from the glacial boulder-clays, or from the washing away of the finer materials contained in older clay formations. They are always very impure.

The red-clay is an abysmal formation, occurring in the sea bottom in the deepest part of the oceans. It is estimated to cover over fifty millions of square miles, and is probably the most extensive deposit which is in course of accumulation at the present day. In addition to the reddish or brownish argillaceous matrix it contains fresh or decomposed crystals of volcanic minerals, such as felspar, augite, hornblende, olivine and pumiceous or palagonitic rocks. These must either have been ejected by submarine volcanoes or drifted by the wind from active vents, as the fine ash discharged by Krakatoa was wafted over the whole globe. Larger rounded lumps of pumice, found in the clay, have probably floated to their present situations, and sank when decomposed, all their cavities becoming filled.
with sea water. Crystals of zeolites (phillipsite) form in the red-clay as radiate, nodular groups. Lumps of manganese oxide, with a black, shining outer surface, are also characteristic of this deposit. They usually encrust pieces of pumice or animal remains. The only fossils of the clay are radiolarias, sharks' teeth and the ear-bones of whales, precisely those parts of the skeleton of marine creatures which are hardest and can longest survive exposure to sea-water. Their comparative abundance shows how slowly the clay gathers. Small rounded spherules of iron, believed by some to be meteoric dust, have also been obtained in some numbers. Among the rocks of the continents nothing exactly the same as this remarkable deposit is known to occur, though fine dark clays, with manganiferous nodules, are found in many localities, accompanied by other rocks which indicate deep-water conditions of deposit.

Another type of red-clay is found in caves, and is known as cave-earth or red-earth (terra rossa). It is fine, tenacious and bright red, and represents the insoluble and thoroughly weathered impurities which are left behind when the calcareous matter is removed in solution by carbonated waters. Similar residual clays sometimes occur on the surface of areas of limestone in hollows and fissures formed by weathering.

Boulder-clay is a coarse unstratified deposit of fine clay, with more or less sand, and boulders of various sizes, the latter usually marked with glacial striations.

Some clay rocks which have been laid down by water are very similar to them in their whole thickness, and are called mudstones. Others split readily into fine leaflets or laminae parallel to their bedding, and this structure is accentuated by the presence of films of other materials, such as sand or vegetable débris. Laminated clays of this sort are generally known as shales; they occur in many formations but are very common in the Carboniferous. Some of them contain much organic débris, and when distilled yield paraffin oil, wax, compounds of ammonia, &c. In these oil-shales there are clear, globular, yellowish bodies which seem to be resins. It has been suggested that the admixture of large quantities of decomposed fresh-water algae among the original mud is the origin of the paraffins.

In New South Wales, Scotland and several parts of America such oil-shales are worked on a commercial scale. Many shales contain large numbers of ovoid or rounded septarian nodules of clay ironstone. Others are rich in pyrites, which, on oxidation, produces sulphuric acid; this attacks the aluminous silicates of the clay and forms aluminium sulphate (alum shales). The illa shales of Whitby contain blocks of semi-mineralized wood, or jet, which is black with a resinous lustre, and a fibrous structure. The laminated structure of shales, though partly due to successive very thin sheets of deposit, is certainly dependent also on the vertical pressure exerted by masses of superincumbent rock; it indicates a transition to the fissile character of clay slates.

**CLAY CROSS**, an urban district in the Chesterfield parliamentary division of Derbyshire, England, near the river Amber, on the Midland railway, 5 m. S. of Chesterfield. Pop. (1901) 8,538. The Clay Cross Colliery and Ironworks Company, whose mines were for a time leased by George Stephenson, employ a great number of hands.

**CLAYMORE** (from the Gaelic claidheamh mór, "great sword"), the old two-edged broadsword with cross hilt, of which the guards were usually turned down, used by the Highlanders of Scotland. The name is also wrongly applied to the single-edged basket-hilted sword adopted in the 16th century and still worn as the full-dress sword in the Highland regiments of the British army.

**CLAYS, PAUL JEAN** (1819-1900), Belgian artist, was born at Bruges in 1819, and died at Brussels in 1900. He was one of the most esteemed marine painters of his time, and early in his career he substituted a sincere study of nature for the extravagant and artificial conventionality of most of his predecessors. When he began to paint, the sea was considered by continental artists as worth representing only under its most tempestuous aspects. Artists cared only for the stirring drama of storm and wreck, and they clung still to the old-world tradition of the romantic school. Clays was the first to appreciate the beauty of calm waters reflecting the slow procession of clouds, the glories of sunset illuminating the sides of ships or gilding the tarred sides of heavy fishing-boats. He painted the peaceful life of rivers, the poetry of wide estuaries, the regulated stir of roadsteads and ports. And while he thus broke away from old traditions he also threw off the trammels imposed on him by his master, the marine painter Theodore Gudin (1802-1880). Endeavouring only to give truthful expression to the nature that delighted his eyes, he sought to render the limpid salt atmosphere, the weight of waters, the transparency of moist horizons, the gem-like sparkle of the sky. A Fleming in his feeling for colour, he set his palette with clean strong hues, and their powerful harmonies were in striking contrast with the rusty, smoky tones then in favour. If he was not a "luminist" in the modern use of the word, he deserves at any rate to be classed with the founders of the modern naturalistic school. This conscientious and healthy interpretation, to which the artist remained faithful, without any important change, to the end of an unusually long and laborious career, attracted those minds which aspired to be bold, and won over those which were moderate. Clays soon took his place among the most famous Belgian painters of his generation, and his pictures, sold at high prices, are to be seen in most public and private galleries. We may mention, among others, "The Beach at Ault," "Boats in a Dutch Port," and "Dutch Boats in the Flying Roads," the last in the National Gallery, London. In the Brussels gallery are "The Port of Antwerp," "Cliffs near Ostend," and a "Calm on the Scheldt"; in the Antwerp museum, "The Meuse at Dordrecht"; in the Pinakothek at Munich, "The Open North Sea"; in the Metropolitan Museum of Fine Arts, New York, "The Festival of the Freedom of the Scheldt at Antwerp in 1863"; in the palace of the king of the Belgians, "Arrival of Queen Victoria at Ostend in 1857"; in the Bruges academy, "Port of Feirugudo, Portugal." Clays was a member of several Academies, Belgian and foreign, and of the Order of Leopold, the Legion of Honour, &c.

(O. M.*)

**CLAYTON, JOHN MIDDLETON** (1796-1856), American politician, was born in Dagsborough, Sussex county, Delaware, on the 24th of July 1796. He came of an old Quaker family long prominent in the political history of Delaware. He graduated at Yale in 1815, and in 1819 began to practise law at Dover, Delaware, where for a time he was associated with his cousin, Thomas Clayton (1777-1854), subsequently a United States senator and chief-justice of the state. He soon gained a large practice. He became a member of the state House of Representatives in 1824, and from December 1826 to October 1828 was secretary of state of Delaware. In 1829, by a combination of anti-Jackson forces in the state legislature, he was elected to the United States Senate. Here his great oratorical gifts gave him a high place as one of the ablest and most eloquent opponents of the administration. In 1831 he was a member of the Delaware constitutional convention, and in 1835 he was returned to the Senate as a Whig, but resigned in the following year. In 1837-1839 he was chief justice of Delaware. In 1845 he again entered the Senate, where he opposed the annexation of Texas and the Mexican War, but advocated the active prosecution of the latter once it was begun. In March 1849 he became secretary of state in the cabinet of President Zachary Taylor, to whose nomination and election his influence had contributed. His brief tenure of the state portfolio, which terminated on the 22nd of July 1850, soon after Taylor's death, was notable chiefly for the negotiation with the British minister, Sir Henry Lytton Bulwer, of the Clayton-Bulwer Treaty (q.v.). He was once more a member of the Senate from March 1855 until his death at Dover, Delaware, on the 9th of November 1856. By his contemporaries Clayton was considered one of the ablest debaters and orators in the Senate.

See the memoir by Joseph P. Comeygs in the *Papers* of the Historical Society of Delaware, No. 4 (Wilmingtton, 1882).
CLAYTON-BULWER TREATY—CLAY-WITH-FLINTS

CLAYTON-BULWER TREATY, a famous treaty between the United States and Great Britain, negotiated in 1850 by John M. Clayton and Sir Henry Lyttton Bulwer (Lord Dalling), in consequence of the situation created by the project of an interoceanic canal across Nicaragua, each signatory being jealous of the activities of the other in Central America. Great Britain had large and indefinite territorial claims in three regions—Belize or British Honduras, the Mosquito Coast and the Bay Islands. On the other hand, the United States, without territorial claims, held in reserve, ready for ratification, treaties with Nicaragua and Honduras, which gave her a certain diplomatic vantage with which to balance the de facto dominance of Great Britain. Agreement on these points being impossible and agreement on the canal question possible, the latter was put in the foreground. The resulting treaty had four essential points. It bound both parties not to "obtain or maintain any exclusive control of the proposed canal, or unequal advantage in its working." It guaranteed the neutralization of such canal. It declared that the intention of the signatories being not only the accomplishment of "a particular object"—i.e., the canal, then supposedly near realization, should be neutral and equally free to the two contracting powers—but also to establish a general principle, they agreed "to extend their protection by treaty stipulation to any other practicable communications, whether by canal or railway, across the isthmus which connects North and South America." Finally, it stipulated that neither signatory would ever "occupy, or fortify, or colonize, or assume or exercise any dominion over Nicaragua, Costa Rica, the Mosquito Coast or any part of Central America," nor make use of any protectorate or alliance, present or future, to such ends.

The treaty was signed on the 10th of April, and was ratified by both governments; but before the exchange of ratifications Lord Palmerston, on the 8th of June, directed Sir H. Bulwer to make a declaration "that the British government did not understand the treaty to apply to the island of Honduras, or its dependencies." Mr Clayton made a counterdeclaration, which recited that the United States did not regard the treaty as applying to the "British settlement in Honduras commonly called British-Honduras...nor the small islands in the neighbourhood of that settlement which may be known as its dependencies"; that the treaty's engagements did apply to all the Central American states, "with their just limits and proper dependencies"; and that these declarations, not being submitted to the United States Senate, could of course not affect the legal import of the treaty. The interpretation of the declarations soon became a matter of contention. The phraseology reflects the effort made by the United States to render impossible a physical control of the canal by Great Britain through the territory held by her at its mouth—the United States losing the above-mentioned treaty advantages,—just as the explicit abnegations of the treaty rendered impossible such control politically by either power. But Great Britain claimed that the excepted "settlement" at Honduras was the "Belize" covered by the extreme British claim; that the Bay Islands were a dependency of Belize; and that, as for the Mosquito Coast, the abnegatory clauses being wholly prospective in intent, she was not required to abandon her protectorate. The United States contended that the Bay Islands were not the "dependencies" of Belize, these being the small neighbouring islands mentioned in the same treaties; that the excepted "settlement" was the British-Honduras of definite extent and narrow purpose recognized in British treaties with Spain; that she had not confirmed by recognition the large, indefinite and offensive claims whose dangers the treaty was primarily designed to lessen; and that, as to the Mosquito Coast, the treaty was retrospective, and mutual in the rigour of its requirements, and as the United States had no de facto possessions, while Great Britain had, the clause binding both not to "occupy" any part of Central America or the Mosquito Coast necessitated the abandonment of such territory. Great Britain was already actually occupying or exercising dominion over the Bay Islands. The United States demanded the complete abandonment of the British protectorate over the Mosquito Indians. It seems to be a just conclusion that when in 1852 the Bay Islands were erected into a British "colony" this was a flagrant infraction of the treaty; that as regards Belize the American arguments were decidedly stronger, and more correct historically; and that as regards the Mosquito question, inasmuch as a protectorate seems certainly to have been recognized by the treaty, to demand its absolute abandonment was unwarranted, although to satisfy the treaty Great Britain was bound materially to weaken it.

In 1859—1860, by British treaties with Central American states, the Bay Islands and Mosquito questions were settled nearly in accord with the American contentions. But by the same treaties Belize was accorded limits much greater than those contended for by the United States. This settlement the British power accepted without cavil for many years.

Until 1867 the United States was constantly for interoceanic canals open equally to the nations and unequivocally neutralized; indeed, until 1880 there was practically no official divergence from this policy. But in 1880—1884 a variety of reasons were advanced why the United States might justly repudiate at will the Clayton-Bulwer Treaty. The new policy was based on national self-interest. The arguments advanced on its behalf were quite indefensible in law and history, and although the position of the United States in 1850—1860 was in general the stronger in history, law and political ethics, that of Great Britain was even more conspicuously the stronger in the years 1880—1884. In 1885 the former government reverted to its traditional policy, and the Hay-Pauncefote Treaty of 1902, which replaced the Clayton-Bulwer Treaty, adopted the rule of neutralization for the Panama Canal.

CLAY WITH-FLINTS, in geology, the name given by W. Whitaker in 1861 to a peculiar deposit of stiff red, brown or yellow clay containing unworn whole flints as well as angular shattered fragments, also with a variable admixture of rounded flint, quartz, quartzite and other pebbles. It occurs in sheets or patches of various sizes over a large area in the south of England, from Hertfordshire on the north to Sussex on the south, and from Kent on the east to Devon on the west. It almost always lies on the surface of the Upper Chalk, but in Dorset it passes on to the Middle and Lower Chalk, and in Devon it is found on the Chert-Beds of the Selborne group (A. J. Jukes-Browne, "The Clay-with-Flints, Its Origin and Distribution," Q.J.G.S., lixii., 1906, p. 132). Many geologists have supposed, and some still do, that the Chalk Clay, or Chalk Bed, was the residue left by the slow solution and disintegration of the Chalk by the processes of weathering; on the other hand, it has long been known that the deposit very frequently contains materials foreign to the Chalk, derived either from the Tertiary rocks or from overlying drift. In the paper quoted above, Jukes-Browne ably summarizes

2 The islands were ceded to Honduras. The Mosquito Coast was recognized as under Nicaraguan rule limited by an attenuated British protectorate over the Indians, who were given a reservation and certain peculiar rights. They were left free to accept full Nicaraguan rule if they desired, e.g., that the "general principle" of that engagement was contingent on the prior realization of its "particular object," which had failed, and the treaty had determined as a special contract; moreover, none of the additional treaties to embody the "general principle" had been negotiated, and Great Britain had not even offered co-operation in the protection and neutrality-guarantee of the Panama railway built in 1850—1855, so that her rights had lapsed; certain engagements of the treaty she had violated, and therefore the whole treaty was voidable, &c.

4 The claims to a part of the first two were very old in origin, but all were vaguely clouded by interruptions of possession, contested interpretations of Spanish-British treaties, and active controversy with the Central American States. The claim to some of the territory was new and still more contestable. See particularly on these claims Travis's book cited below.
The evidence against the view that the deposit is mainly a Chalk residue, and brings forward a good deal of evidence to show that many patches of the Clay-with-Flints lie upon the same plane and may be directly associated with Reading Beds. He concludes that "the material of the Clay-with-Flints has been chiefly and almost entirely derived from Eocene clay, with addition of some flints from the Chalk; that its presence is an indication of the previous existence of Lower Eocene Beds on the same site and nearly at the same relative level, and, consequently, that comparatively little Chalk has been removed from beneath it. Finally, I think that the tracts of Clay-with-Flints have been much more extensive than they are now" (loc. cit. p. 159).

It is noteworthy that the Clay-with-Flints is developed over an area which is just beyond the limits of the ice sheets of the Glacial epoch, and the peculiar conditions of late Pliocene and Pleistocene times; involving heavy rains, snow and frost, may have had much to do with the mingling of the Tertiary and Chalky material. Besides the occurrence in surface patches, Clay-with-Flints is very commonly to be observed descending in "pipes" often to a considerable depth into the Chalk; here, if anywhere, the residual chalk portion of the deposit should be found, and it is surmised that a thin layer of very dark clay with darkly stained flints, which appears in contact with the sides and bottom of the pipe, may represent all there is of insoluble residue.

A somewhat similar deposit, a "conglomérat de silex" or "argile à silex," occurs at the base of the Eocene on the southern and western borders of the Paris basin, in the neighbourhood of Chartres, Thimerais and Sancerreos. (J. A. H.)

CLAZOMENAE (mod. Késtis of), an ancient town of Ionia and a member of the Ionian Dodecapolis (Confederation of Twelve Cities), on the Gulf of Smyrna, about 20 m. W. of that city. Though not in existence before the arrival of the Ionians in Asia, its original founders were largely settlers from Phlius and Cleonea. It stood originally on the isthmus connecting the island of Samos with the mainland, over which Erythrae stood; but the inhabitants, alarmed by the encroachments of the Persians, removed to one of the small islands of the bay, and there established their city. This island was connected with the mainland by Alexander the Great by means of a pier, the remains of which are still visible. During the 5th century it was for some time subject to the Athenians, but about the middle of the Peloponnesian war (412 B.C.) it revolted. After a brief resistance, however, it again acknowledged the Athenian supremacy, and repelled a Lacedaemonian attack. Under the Romans Clazomenae was included in the province of Asia, and enjoyed an immunity from taxation. The site can still be made out, in the neighbourhood of Vouria, but nearly every portion of its ruins has been removed. It was the birthplace of the philosopher Anaxagoras. It is famous for its painted terra-cotta sarcophagi, which are the finest monuments of Ionian painting in the 5th century B.C. (E. Gr.)

CLEANTHES (c. 301–232 or 252 B.C.), Stoic philosopher, born at Assos in the Troad, was originally a boxer. With four drachmas in his possession he came to Athens, where he listened first to the lectures of Crates the Cynic, and then to those of Zeno, the Stoic, supporting himself meanwhile by working all night as water-carrier to a gardener (hence his nickname Φαραγγίας). His power of patient endurance, or perhaps his slowness, earned him the title of "the Ass"; but such was the esteem awakened by his high moral qualities that, on the death of Zeno in 263, he became the leader of the school. He continued, however, to support himself by the labour of his own hands. Among his pupils were his successor, Chrysippus, and Antigonus, king of Macedon, from whom he accepted 2000 minae. The manner of his death was characteristic. A dangerous ulcer had compelled him to fast for a time. Subsequently he continued his abstinence, saying that, as he was already half-way in the road to death, he would not trouble to retrace his steps.

Cleantches produced very little that was original, though he wrote some fifty works, of which fragments have come down to us. The principal is the large portion of the Hymn to Zeus which has been preserved in Stobaeus. He regarded the sun as the abode of God, the intelligent providence, or (in accordance with Stoical materialism) the vivifying fire or aether of the universe. Virtue, he taught, is life according to nature; but pleasure is not according to nature. He originated a new theory as to the individual existence of the human soul; he held that the degree of its vitality after death depends upon the degree of its vitality in life. The principal fragments of Cleantches's works are contained in Diogenes Laertius and Stobaeus; some may be found in Cicero and Seneca.

See G. C. Mohinke, Kleanthes der Stoiker (Greifswald, 1814); C. Wachsmuth, Commentationes de Zeno Critics et Cleanthes Asio (Göttingen, 1874-1875); A. C. Pearson, Fragments of Zeno and Cleanthes (Camb., 1891); article by E. Wellmann in E. Bickel and Gruber's Allgemeine Encyclopädie; R. Hirzel, Untersuchungen zu Ciceros philosophischen Schriften, ii. (1882), containing a vindication of the originality of Cleanthes; A. B. Kröcke, Forschungen über den Gebiete der alten Philosophie (1890); also works quoted under Stoics.

CLeARCHUS, the son of Rhamphias, a Spartan general and condottiere. Born about the middle of the 5th century B.C., Clearchus was sent with a fleet to the Hellespont in 411 and became governor (ἀρχων της) of Byzantium, of which town he was prozeugos. His severity, however, made him unpopular, and in his absence the gates were opened to the Athenian besieging army under Alcibiades (409). Subsequently appointed by the ephors to settle the political dissensions then rife at Byzantium and to protect the city and the neighbouring Greek colonies from Thracian attacks, he made himself tyrant of Byzantium, and, when declared an outlaw and driven thence by a Spartan force, he fled to Cyrus. In the "expedition of the ten thousand" undertaken by Cyrus to dethrone his brother Artaxerxes Mnemon, Clearchus led the Peloponnesians, who formed the right wing of Cyrus's army at the battle of Cunaxa (401). On Cyrus's death Clearchus assumed the chief command and, after the second battle of Cunaxa, appointed the rest of the fellow-generals by Tissaphernes, he was handed over to Artaxerxes and executed (Thuc. viii. 39, 80; Xen. Hellenica, i. 3, 15-19; Anabasis, i. ii.; Diodorus xiv. 12, 19-26). In character he was a typical product of the Spartan educational system. He was a warrior to the finger-tips (πολέμικος και φιλόμελος επιθύμωτος. Xen. Anab. ii. 6, 1), and his tireless energy, unfaltering courage and strategic ability made him an officer of no mean order. But he seems to have had no redeeming touch of refinement or humanity.

CLEARFIELD, a borough and the county-seat of Clearfield county, Pennsylvania, U.S.A., on the W. branch of the Susquehanna river, in the W. central part of the state. Pop. (1890) 2248; (1900) 3081 (310 foreign-born); (1910) 6851. It is served by the New York Central & Hudson River, the Pennsylvania, and the Buffalo, Rochester & Pittsburg railways. The borough is about 1105 ft. above sea-level, in a rather limited space between the hills, which command picturesque views of the narrow valley. The river runs through the borough. Coal and ore-clay abound in the vicinity, and these, with leather, iron, timber and the products of the fertile soil, are the bases of its leading industries. Before the arrival of the whites the place had been cleared of timber (whence its name), and in 1805 it was chosen as a site for the county-seat of the newly erected county and laid out as a town; in 1840 it was incorporated as a borough.

CLEARING-HOUSE, the general term for a central institution employed in connexion with large and interrelated businesses for the purpose of facilitating the settlement of accounts.

Banking.—The London Clearing-House was established between 1790 and 1770 as a place where the clerks of the bankers of the city of London could assemble daily to exchange with one another the cheques drawn upon and bills payable at their respective houses. Before the clearing-house existed, each banker had to send a clerk to the places of business of all the other bankers in London to collect the sums payable by them in respect of cheques and bills; and it is obvious that much
time was consumed by this process, which involved the use of an unnecessary quantity of money and corresponding risks of safe carriage. In 1775 a room in Change Alley was settled upon as a common centre of exchange; this was afterwards removed to Post Office Court, Lombard Street. This clearing centre was at first confined to the bankers—at that time and long afterwards exclusively private bankers—doing business within the city, and the bankers in the west end of the metropolis used one or other of the city banks as their agent in clearing. When the joint-stock banks were first established, the jealousy of the existing banks was powerful enough to exclude them altogether from the use of the Clearing-House; and it was not until 1854 that this feeling was removed so as to allow them to be admitted.

At first the Clearing-House was simply a place of meeting, but it came to be perceived that the sorting and distribution of cheques, bills, &c., could be more expeditiously conducted by the appointment of two or three common clerks to whom each banker’s clerk could give all the instruments of exchange he wished to collect, and from whom he could receive all those payable at his own house. The payment of the balance settled the transaction, but the arrangements were afterwards so perfected that the balance is now settled by means of transfers made at the Bank of England between the Clearing-House account and those of the various banks, the Clearing-House, as well as each banker using it, having an account at the Bank of England. The use of the Clearing-House was still further extended in 1858, so as to include the settlement of exchanges between the country bankers of England. Before that time each country banker receiving cheques on other country bankers sent them to those other bankers by post (supposing they were not carrying on business in the same place), and requested that the amount should be paid by the London agent of the banker on whom the cheques were drawn to the London agent of the banker remitting them. Cheques were thus collected by correspondence, and each remittance involved a separate payment in London. Since 1858, accordingly, a country banker sends cheques on other country banks to his London correspondent, who exchanges them at the Clearing-House with the correspondents of the bankers on whom they are drawn.

The Clearing-House consists of one long room, lighted from the roof. Around the walls and down the centre are placed desks, allotted to the various banks, according to the amount of their business. The desks are arranged alphabetically, so that the clerks may lose no time in passing round the room and delivering their “charges” or batches of cheques to the representatives of the various banks. There are three clearings in London each day. The first is at 10 A.M., the second at noon, and the third at 2.30 P.M. It is the busiest of all, and continues until five minutes past four, when the last delivery must be made. The three clearings were, in 1907, divided into town, metropolitan and country clearings, each with a definite area. All the clearing banks have their cheques marked with the letters "T," "M" and "C," according to the district in which the issuing bank is situated. Every cheque issued by the clearing banks, even though drawn in the head office of a bank, goes through the Clearing-House.

The amount of business transacted at the Clearing-House varies very much with the seasons of the year, the busiest time being when dividends are paid and stock exchange settlements are made, but the volume of transactions averages roughly from 200 to 300 millions sterling a week, and the yearly clearances amount to something like £12,000,000,000. There are provincial clearing-houses at Manchester, Liverpool, Birmingham, Newcastle-on-Tyne, Leeds, Sheffield, Leicester and Bristol. There are also clearing-houses in most of the large towns of Scotland and Ireland. In New York and the other large cities of the United States there are clearing-houses providing accommodation for the various banking institutions (see Banks and Banking).

The progress of banking on the continent of Europe has been slow in comparison with that of the United Kingdom, and the use of cheques is not so general, consequently the need for clearing-houses is not so great. In France, too, the greater proportion of the banking business is carried on through three banks only, the Banque de France, the Société Générale and the Crédit Lyonnais, and a great part of their transactions are settled at their head offices. But at the same time large sums pass through the Paris Chamber de Compagnon (the clearing-house), established in 1872.

There are clearing-houses also in Berlin, Hamburg and many other European cities.

Railways.—The British Railway Clearing-House was established in 1842, its purpose, as defined by the Railway Clearing-House Act of 1850, being “to settle and adjust the receipts arising from railway traffic within, or partly within, the United Kingdom, and passing over more than one railway within the United Kingdom, booked or invoiced at throughout rates or fares.” It is an independent body, governed by a committee which is composed of delegates (usually the chairman or one of the directors) from each of the railways that belong to it. Any railway company may be admitted a party to the clearing-system with the assent of the committee, may cease to be a member at a month’s notice, and may be expelled if such expulsion be voted for by the two-thirds of the delegates present at a specially convened meeting. The committee distributes to the companies proportional to the volume of business passed through it by each. It has two main functions. (1) When passengers or goods are booked through between stations belonging to different railway companies at an inclusive charge for the whole journey, it distributes the money received in due proportions between the companies concerned in rendering the service. To this end it receives, in the case of passenger traffic, a monthly return of the tickets issued at each station to stations on other lines, and, in the case of goods traffic, it is supplied by both the sending and receiving stations (when these are on different companies’ systems) with abstracts showing the character, weight, &c., of the goods that have travelled between them. By the aid of these particulars it allocates the proper share of the receipts to each company, having due regard to the distance over which the traffic has been carried on each line, to the terminal services rendered by each company, to any incidental expenses to which it may have been put, and to the existence of any special agreements for the division of traffic. (2) To avoid the inconvenience of a change of train at points where the lines of different companies meet, passengers are often, and goods and minerals generally, carried in through vehicles from their starting-point to their destination. In consequence, vehicles belonging to one company are constantly forming part of trains that belong to, and run over the lines of, other companies, which thus have the temporary use of rolling stock that does not belong to them. By the aid of a large staff of “number-takers” who are stationed at junctions all over the country, and whose business it is to record particulars of the vehicles which pass through those junctions, the Clearing-House follows the movements of vehicles which have left their owners’ line, ascertains how far they have run on the lines of other companies, and debits each of the latter with the amount it has to pay for their use. This charge is known as mileage”, another charge which is also determined by the Clearing-House, that is, the amount exacted from the detailing companies is a variable amount returned to its owners within a prescribed time. By the exercise of these functions the Clearing-House accumulates a long series of credits to, and debits against, each company; these are periodically added up and set against each other, with the result that the accounts between it and the companies are finally settled by the transfer of comparatively small balances. It also distributes the money paid by the post-office to the railways on account of the conveyance of parcel-post traffic, and through its lost luggage department many thousands of articles left in railway carriages are every year returned to their owners. Its situation in London further renders it a convenient meeting-place for several "Clearing-House Conferences" of railway officials, as of the general managers, the goods managers, and the superintendents of the line, held four times a year for the consideration of questions in which all the companies are interested. The Irish Railway
CLEATOR—CLEAVERS

Cleator, established in 1848, has its headquarters in Dublin, and was incorporated by act of parliament in 1860.

The principle of clearing adopted by banks and railways has been applied with considerable success in other businesses.

In 1874 the London Stock Exchange Clearing-House was established for the purpose of settling transactions in stock, the clearing being effected by balance-sheets and tickets; the balance of stock to be received or delivered is shown on a balance-sheet sent in by each member, and the items are then cancelled against one another and tickets issued for the balances outstanding. The New York Stock Exchange Clearing-House was established in 1892. The settlements on the Paris Bourse are cleared within the Bourse itself, through the Compagnie des Agents de Change de Paris.

In 1888 a society was formed in London called the Beetroot Sugar Association for clearing bargains in beetroot sugar. For every 300 bags of sugar of a definite weight which a broker sells, he issues a filière (a form resembling a dish-warrant), giving particulars as to the ship, the warehouse, trade-marks, &c. The filière contains also a series of transfer transfers, which, when filled up and signed by each successive holder, so transferring the property to a new purchaser. The new purchaser also fills up a copy attached to the transfer, quoting the date and hour of sale. This copy is detached by the seller and retained by him as evidence to determine any liability through subsequent delay in the delivery of the sugar. Any purchaser requiring delivery of the sugar forwards the filière to the clearing-house, and the officials then send on his name to the first seller who tenders him the warrant direct. These filières pass from hand to hand within a limited period, a stamp being affixed on each transfer as a clearing-house fee. The difference between each of the successive transactions is adjusted by the clearing-house to the profit or loss of the seller.

The London Produce Clearing-House was established in 1888 for regulating and adjusting bargains in foreign and colonial Produce. The object of the association is to guarantee both to the buyer and the seller the fulfilment of bargains for future delivery. The transactions on either side are allowed to accumulate during a month and an adjustment made at the end by a settlement of the final balance owing. On the same lines are the Caisse de Liquidation at Havre and the Waaren Liquidations Casse at Hamburg. The Cotton Association also has a clearing-house at Liverpool for clearing the transactions which arise from dealings in cotton.

Authorities.—W. Howarth, Our Clearing System and Clearing Houses (1897), The Banks in the Clearing House (1905); J. G. Cannam, Clearing-houses, their History, Methods and Administration (1901); H. T. Easton, Money, Exchange and Banking (1905); and the various volumes of the Journal of the Institute of Bankers.

CLEAT (a word common in various forms to many Teutonic languages, in the sense of a wedge or lump, cf. "clod" and "clot"), a wedge-shaped piece of wood fastened to ships' masts and elsewhere to prevent a rope, collar or the like from slipping, or to act as a step; more particularly a piece of wood or metal with double or single horns used for belaying ropes. A "clad" is also a wedge fastened to a ship's side to catch the shores in a launching cradle or dry dock. "Clad" is also used in mining for the vertical cleavage-planes of coal.

CLEATOR MOOR, an urban district in the Egremont parliamentary division of Cumberland, England, 4 m. S.E. of Whitehaven, served by the Furness, London & North-Western and Cleator & Workington Junction railways. Pop. (1901) 8120. The town lies between the valleys of the Ehen and its tributary the Dub Beck, in a district rich in coal and iron ore. The mining of these, together with blast furnaces and engineering works, occupies the large industrial population.

CLEAVERS, or Goose-grass, Galium Aparine (natural order Rubiaceae), a common plant in hedges and waste places, with a long, weak, straggling, four-sided, green stem, bearing whorls of 6 to 8 narrow leaves, ½ to 2 in. long, and, like the angles of the stem, rough from the presence of short, stiff, downward-pointing, hooked hairs. The small, white, regular flowers are borne, a few together, in axillary clusters, and are followed by the large, bipartite, two-celled fruit, which, like the rest of the plant, readily clings to a rough surface, whence the common name. The plant has a wide distribution throughout the north temperate zone, and is also found in temperate South America.

CLEBURNE, a town and the county-seat of Johnson county, Texas, U.S.A., 25 m. S. of Fort Worth. Pop. (1890) 3278; (1900) 7493, including 611 negroes; (1910) 10,364. It is served by the Gulf, Colorado & Santa Fé, the Missouri, Kansas & Texas, and the Trinity & Brazos Valley railways. It is the centre of a prosperous farming, fruit and stock-raising region, has large railway repair shops, flour-mills, cotton gins and foundries, a canning factory and machine shops. It has a Carnegie library, and St Joseph's Academy (Roman Catholic; for girls). The town was named in honour of Patrick Ronayne Cleburne (1828–1864), a major-general of the Confederate army, who was of Irish birth, practised law in Helena, Arkansas, served at Shiloh, Perryville, Stone River, Chickamauga, Missionary Ridge, Ringgold Gap, Jonesboro and Franklin, and was killed in the last-named battle; he was called the "Stonewall of the West."

CLECKHEATON, an urban district in the Spen Valley parliamentary division of the West Riding of Yorkshire, England, 5½ m. S. by E. of Bradford, on the Lancashire & Yorkshire, Great Northern and London & North-Western railways. Pop. (1901) 12,524. A chamber of commerce has held meetings here since 1878. The industries comprise the manufacture of woollens, blankets, flannel, wire-card and machinery.

CLEETHORPES, a watering-place of Lincolnshire, England; within the parliamentary borough of Great Grimsby, 3 m. S.E. of that town by a branch of the Great Central railway. Pop. of urban district of Cleethorpe with Thurmaston (1901) 12,578. Cleethorpes faces eastward to the North Sea, but its shore of fine sand, affording good bathing, actually belongs to the estuary of the Humber. There is a pier, and the sea-wall extends for about a mile, forming a pleasant promenade. The suburb of New Clec connects Cleethorpes with Grimsby. The church of the Holy Trinity and St Mary is principally Norman of various dates, but work of a date apparently previous to the Conquest appears in the tower. Cleethorpes is greatly favoured by visitors from the midland counties, Lancashire and Yorkshire.

CLEFT PALATE and HARE-LIP, in surgery. Cleft Palate is a congenital cleavage, or incomplete development in the roof of the mouth, and is frequently associated with hare-lip. The infant is prevented from sucking, and an operation is necessary. Cleft-palate is often a hereditary defect. The most favourable time for operating is between the age of two weeks and three months, and if the cleft is closed at this early date, not only are the nutrition and general development of the child greatly improved, but the voice is probably saved from much of the unpleasant tone which is usually associated with a defective roof to the mouth and is apt to persist even if a cleft has been successfully operated on later in childhood. The greatest advance that has been made in the operative treatment of cleft palate is due to the teaching of Sir W. G. B. Browne, who adopted the ingenious plan of thrusting together to the middle line of the mouth the halves of the palate which nature had unfortunately left apart. But, as noted above, this operation must, to give the best results, be undertaken in the earliest months of infancy. After the cleft in the palate has been effectually dealt with, the hare-lip can be repaired with ease and success. Hare-lip.—In the hare the splitting of the lip is in the middle line, but in the human subject it is on one side, or on both sides of the middle line. This is accounted for on developmental grounds: a cleft in the exact middle line is of extremely rare occurrence. Hare-lip is often associated with cleft palate. Though we are at present unable to explain why development should so frequently miss the mark in connexion with the formation of the lip and palate, it is unlikely that maternal impressions have anything to do with it. As a rule, the supposed "fright" comes long after the lips are developed. They are completely formed by the ninth week. Heredity has a powerful influence
in many cases. The best time for operating on a hare-lip depends upon various circumstances. Thus, if it is associated with cleft palate it may be that the cleft has first to be closed, in which case the child will probably be several months old before the lip is operated on. If the infant is so poor a state of nutrition that it appears unsuitable for surgical treatment, the operation must be postponed until his condition is sufficiently improved. But, assuming that the infant is in fair health, that he is taking his food well and thriving on it, that he is not troubled by vomiting or diarrhoea, and that the hare-lip is not associated with a defective palate, the sooner it is operated on the better. It may be successfully done even within a few hours of birth. When a hare-lip is unassociated with cleft palate, the infant may possibly be enabled to take the breast within a short time of the gap being closed. In such a case the operation may be advisable undertaken within the first few days of birth. The case being suitable, the operation may be conveniently undertaken at any time after the tenth day.

CLEISTHENES, the name of two Greek statesmen, (1) of Athens, (2) of Sicyon, of whom the first is far the more important. (E. O.*)

CLEISTHENES, the Athenian statesman, was the son of Megacles and Agariste, daughter of Cleisthenes of Sicyon. He thus belonged, through his father, to the noble family of the Alcmaeonidae (q.v.), who bore upon them the curse of the Cylonian massacre, and had been in exile during the rule of the Peisistratids. In the hope of washing out the stigma, which damaged their prestige, they spent the latter part of their exile in carrying out with great splendour the contract given out by the Amphictyons for the rebuilding of the temple at Delphi (destroyed by fire in 548 B.C.). By building the Pronaos of Parian marble instead of limestone as specified in the contract, they acquired a high reputation for piety; the curse was consigned to oblivion, and their reinstatement was imposed by the oracle itself upon the Spartan king, Cleomenes (q.v.). Cleisthenes, to whom this far-seeing stonement must probably be attributed, had also on his side (1) the malcontents in Athens who were disgusted with the growing severity of Hippias, and (2) the oligarchs of Sparta, partly on religious grounds, and partly owing to the ascendency of tyranny. Aristotle's Constitution of Athens, however, treats of the Peisistratids with Argos, the rival of Sparta in the Peloponnesian, as the chief ground for the action of Sparta (c. 19). In c. 513 B.C. Cleisthenes invaded Attica, but was defeated by the tyrant's mercenaries at Leipsydrium (S. of Mt. Parnes). Sparta then, in tardy obedience to the oracle, threw off her alliance with the Peisistratids, and, after one failure, expelled Hippias in 511-510 B.C., leaving Athens once again at the mercy of the powerful families.

Cleisthenes, on his return, was in a difficulty; he realized that Athens would not tolerate a new tyrant, nor were the other nobles willing to accept him as leader of a constitutional oligarchy. It was left for him to take the people into partnership as Peisistratus had in a different way done before him. Solon's reforms had failed, primarily because they left unimpaired the power of the great landed estates, in their own districts, doubled the roles of landlord, priest and patriarch. This evil of local influence Peisistratus had concealed by satisfying the nominally sovereign people that in him they had a sufficient representative. It was left to Cleisthenes to adopt the remaining remedy of giving substance to the form of the Solonian constitution. His first attempts roused the aristocrats to a last effort; Isagoras appealed to the Spartans (who, though they disliked tyranny, had no love for democracy) to come to his aid. Cleisthenes retired on the arrival of a herald from Cleomenes, reviving the old question of the curse; Isagoras thus became all-powerful and expelled seven hundred families. The democrats, however, 1

The archonship of Isagoras in 508 is important as showing that Cleisthenes, three years after his return, had so far failed to secure the support of a majority in Athens. There is no sufficient reason for supposing that the election of Isagoras was procured by Cleomenes; all the evidence points to its having been brought about in the ordinary way. Probably, therefore, Cleisthenes did not take the people thoroughly into partnership till after the spring of 508. and, after besieging Cleomenes and Isagoras in the Acropolis, let them go under a safe-conduct, and brought back the exiles.

Apart from the reforms which Cleisthenes was now able to establish, the period of his ascendancy is a blank, nor are we told when and how it came to an end. It is clear, however, and it is impossible in connexion with the Pan-hellenic patriotism to which Athens laid claim, to overrate the importance of the fact—that Cleisthenes, hard pressed in the war with Boeotia, Euboea and Sparta (Herod. v. 73 and foll.), sent ambassadors to ask the help of Persia. The story, as told by Herodotus, that the ambassadors of their own accord agreed to give "earth and water" (i.e. submission) in return for Persian assistance, and that the Ecclesia subsequently disavowed their action as unauthorized, is scarcely credible. Cleisthenes (1) was in full control and must have instructed the ambassadors; (2) he knew that any help from Persia meant submission. It is practically certain, therefore, that he (cf. the Alcmaeonids and the story of the shield at Marathon) was the first to "meddle." (see Curtius, History of Greece). Probably he had hoped to persuade the Ecclesia that the agreement was a mere form. Aelian says that he himself was a victim to his own device of ostracism (q.v.); this, though apparently inconsistent with the Constitution of Athens (c. 22), may perhaps indicate that his political career ended in disgrace, a hypothesis which is explicable on the ground of this act of treachery in respect of the attempted Persian alliance. Whether to Cleisthenes are due the final success over Boeotia and Euboea, the planting of the 4000 cleruchs on the Lelantine Plain, and the policy of the Aeginetan War (see Aegina), in which Athens borrowed ships from Corinth, it is impossible to determine. The eclipse of Cleisthenes in all records is one of the most curious facts in Greek history. It is also curious that we do not know in what official capacity Cleisthenes carried his reforms. Perhaps he was given extraordinary ad hoc powers for a specified time; conceivably he used the ordinary mechanism. It seems clear that he had fully considered his scheme in advance, that he broached it before the last mutiny of Isagoras, and that it was only after the final expulsion of Isagoras and his Spartan allies that it became possible for him to put it into execution.

Cleisthenes aimed at being the leader of a self-governing people; in other words he aimed at making the democracy actual. He realized that the dead-weight which held the democracy down was the influence on politics of the local religious unit. Therefore his prime object was to dissociate the clans and the phratries from politics, and to give the democracy a totally new electoral basis in which old associations and vested interests would be split up and become ineffective. It was necessary that no man should govern a pocket-constituency merely by virtue of his religious, financial or ancestral prestige, and that there should be created a new local unit with administrative powers of a democratic character which would galvanize the lethargic voters into a new sense of responsibility and independence. His first step was to abolish the four Solonian tribes and create ten new tribes. Each of the new tribes was subdivided into "demes" (roughly "townships"); this organization did not, except politically, supersede the system of clans and phratries whose old religious signification remained untouched. The new tribes, however, though geographically arranged, did not represent local interests. Further, the tribe names were taken from legendary heroes (Cecropis, Pandionis, Aegeis recalled the storted kings of Attica), and, therefore, contributed to the idea of a national unity; even Ajax, the eponym of the tribe Aeantis, though not Attic, was famous as an ally (Herod. v. 66) and ranked as a national hero. Each tribe had its shrine and its particular hero-cult, which, however, was free from local association and the dominance of particular

---

1 The explanation given for this step by Herodotus (v. 67) is an amusing example of his incapacity as a critical historian. To compare Cleisthenes of Sicyon (see below), bent on humiliating the Dorians of Sicyon by giving opprobrious names to the Dorian tribes, with his grandson, whose endeavour was to elevate the very persons whose tribal organization he replaced, is clearly absurd.
families. This national idea Cleisthenes further emphasized by setting up in the market-place at Athens a statue of each tribal hero.

The next step was the organization of the deme. Within each tribe he grouped ten demes (see below), each of which had

Demes.

(1) its hero and its chapel, and (2) its census-list kept by the demarch. The demarch (local governor), who was elected popularly and held office for one year, presided over meetings affecting local administration and the provision of crews for the state-navy, and was probably under a system of scrutiny like the dokimasia of the state-magistrates.

According to the Aristotelian Constitution of Athens, Cleisthenes further divided Attica into three districts, Urban and Suburban, Inland (Mesogaios), and Maritime (Paralia), each of which was subdivided into ten tribes; each tribe had three triptyes in each of these districts. The problem of establishing this decimal system in connexion with the demes and triptyes is insoluble. Herodotus says that there were ten demes to each tribe (κάτα ένας φόλας); but each tribe was composed of three triptyes, one in each of the three districts. Since the deme was, as will be seen, the electoral unit, it is clear that in tribal voting the object of ending the old threefold schism of the Plain, the Hill and the Shore was attained, but the relation of deme and triptye is obviously of an unsymmetrical kind. The Constitution of Athens says nothing of the ten-deme-to-each-tribe arrangement, and there is no sufficient reason for supposing that the demes originally were exactly a hundred in number. We know the names of 168 demes, and Ptolemy (3rd century B.C.) enumerated 173. It has been suggested that the demes did originally number exactly a hundred, and that new demes were added as the population increased. This theory, however, presupposes that the demes were originally equal in numbers. In the 5th and 4th centuries this was certainly not the case; the number of demesmen in some cases was only one hundred or two hundred, whereas the deme Acharnae is referred to as a "great part" of the whole state, and is known to have furnished three thousand hoplites. The theory is fundamentally at fault, inasmuch as it regards the deme as consisting of all those resident within its borders. In point of fact membership was hereditary, not residential; Demosthenes "of the Paenian deme" might live where he would without severing his deme connexion. Thus the increase of population could be no reason for creating new demes. This distinction in a deme between demesmen and residents belonging to another deme (the ἐκστημάτων), who paid a deme-tax for their privilege, is an important one. It should further be noted that the demes belonging to a particular tribe do not, as a fact, appear always in three separate groups; the tribe Aeantis consisted of Phalerum and eleven demes in the district of Marathon; other tribes had demes in five or six groups. It must, therefore, be admitted that the problem is insoluble for want of data. Nor are we better equipped to settle the relation between the Cleisthenian division into Urban, Maritime and Inland, and the old divisions of the Plain, the Shore and the Upland or Hill. The "Maritime" of Cleisthenes and the old "Shore" are certainly not coincident, nor is the "Inland" identical with the "Upland".

Lastly, it has been asked whether we are to believe that Cleisthenes invected the demes. To this the answer is in the negative. The demes were undoubtedly primitive divisions of Attica; Herodotus (ix. 73) speaks of the Dioscuri as ravaging the demes of Decelea (see R. W. Macan ad loc.) and we hear of opposition between the city and the demes. The most logical conclusion perhaps is that Cleisthenes, while he did create the demes which Athens itself comprised, did not create the country demes, but merely gave them definition as political divisions. Thus the city itself had six demes in five different tribes, and the other five tribes were represented in the suburbs and the Peiraices.

It is clear that in the Cleisthenian system there was one great source of danger, namely that the residents in and about Athens must always have had more weight in elections than those in distant demes. There can be little doubt that the preponderating influence of the city was responsible for the unwisdom of the later imperial policy and the Peloponnesian war.

A second problem is the franchise reform of Cleisthenes. Aristotle in the Politics (iii. 2, 3 = 1275 b) says that Cleisthenes created new citizens by enrolling in the tribes "many resident aliens and enslaved slaves." But the Aristotelian Constitution of Athens asserts that he gave "citizenship to the masses." These two statements are not compatible. It is perfectly clear that Cleisthenes is to be regarded as a democrat, and it would have been no brine to the people merely to confer a boon on aliens and slaves.

Moreover, a revision of the citizen-roll (diaprephephus) had recently taken place (after the end of the tyranny) and a great many citizens had been struck off the roll as being of impure descent (οἱ τῶν γένεσιν μηδ' ἀνθρώπου). This class had existed from the time of Solon, and, through fear of political extinction by the oligarchs, had been favourable to Pericles. Cleisthenes may have enfranchised aliens and slaves, but it seems certain that he must have dealt with these free Athenians who had lost their rights. Now the sargas presumably did not carry out the function of the citizen-roll (diaprephephus); as "the frith of the tyrants" (so Ath. Pol. 20; by Meyer, Busolt and others contest this) he would not have struck a blow at a class which favoured his own views. A reasonable hypothesis is that Cleisthenes was the originator of the measure of expulsion, and that he now changed his policy, and strengthened his hold on the democracy by reinstating the disfranchised in much larger numbers. The new citizens, whoever they were, must, of course, have been enrolled also in the (hitherto exclusive) pantry lists and the deme-rolls.

The Bouli (q.v.) was reorganized to suit the new tribal arrangement, and was known henceforward as the Council of the Five Hundred, fifty each from each tribe. Its exact constitution is unknown, but it was certainly more democratic than the Solonian Four Hundred. Further, the system of ten tribes led in course of time to the construction of boards of ten to deal with military and civil affairs, e.g., the Strategi (see Strategus), the Apodectae, and others. Of these the former cannot be attributed to Cleisthenes, but on the evidence of Androtion it is certain that it was Cleisthenes who replaced the Colacretae by the Apodectae ("receivers"), who were controllers and auditors of the finance department, and, before the council in the council-chamber, received the revenues. The Colacretae, who had done this work before, remained in authority over the internal expenses of the Prytanæum. A further change which followed from the new tribal system was the reconstitution of the army; this, however, probably took place about 501 B.C., and cannot be attributed directly to Cleisthenes. It has been said that the deme became the local political unit, replacing the naucracy (q.v.). But the naucraries still supplied the fleet, and were increased in number from forty-eight to fifty; if each naucracy still supplied a ship and two mounted soldiers as before, it is interesting to learn that, only seventy years before the Peloponnesian War, Athens had but fifty ships and a hundred horse. 8

The device of ostracism is the final stone in the Cleisthenian structure. An admirable scheme in theory, and, at first, in practice, it deteriorated in the 5th century into a mere party

It should be observed that there are other translations of the difficult phrase ξιγοὶ καὶ δολοίς μετάλλευσον.

Colacretae were very ancient Athenian magistrates; either (1) those who "collected the joints" (νόμος καὶ κράτεις) or (2) those who "collected the joints" (καλα, ἀγαθοῖς) which were left over from public sacrifices, and consumed in the Prytanæum. These officials were again important in the time of Aristophanes (Wasps, 693, 734: Birds, 1541) and they consigned over the payment of the ducræ instituting the Periclean. They are not preserved, though they may have existed, after 403 B.C. At Sicyon also magistrates of this name are found.

It is, however, more probable that the right reading of the passage is ξιγοὶ πεῖπτον instead of ξιγοῖ, which would give a cavalry force in early Athens of 480, a reasonable number in proportion to the total fighting strength.
weapon, and in the case of Hyperbolus (137) became an
absurdity.

In conclusion it should be noticed that Cleisthenes
was the founder of the Athens which we know. To him was due
the spirit of nationality, the principle of liberty duly
apportioned and controlled by decentralized and
democratized administration, which prepared the ground for the
rich developments of the Golden Age with its triumphs of art
and literature, politics and philosophy. It was Cleisthenes who
organized the structure which, for a long time, bore the heavy
burden of the Empire against impossible odds, the structure
which the very different genius of Pericles was able to beautify.
He was the first to appreciate the powerful unity in politics,
literature and society of an organized public opinion.

2. CLEISTHENES of Sicily (c. 600-570), grandfather of the
above, became tyrant of Sicily as the representative of the
conquered Ionian section of the inhabitants. He
explained the destruction of Doric supremacy by giving ridiculous
epithets to their tribal units, which from Hyblees, Dymanes and
Pamphyli became Hytaiae ("Swine-men"), Chairetae ("Pig-
men") and Oneatae ("Ass-men"). He also attacked Doric
Argos, and suppressed the Homeric "rhapsoodists" who sang
the exploits of Doric heroes. He championed the cause of
the Delphic oracle against the town of Crissa (Cirtha) in the Sacred
War (c. 590). Crissa was destroyed, and Delphi became one of the
meeting-places of the old amphiarchy of Anthela, henceforward
often called the Delphic amphiarchy. The Pythian games,
largely the initiative of Cleisthenes were re-established
with new magnificence, and Cleisthenes won the first chariot race in
582. He founded Pythagorean games at Sicyon, and possibly built
a new Sicyonian treasury at Delphi. His power was so great
that when he offered his daughter Agriste in marriage, some of the
most prominent Greeks sought the honour, which fell upon
Megalaces, the Alcmeneid. The story of the rival wooers with
the famous retort, "Hippocleides don't care," is told in Herod.
vi. 123; see also Herod. vi. 67 and Thuc. i. 18.

CLEISTHENES is also the name of an Athenian, pilloried by Aristophanes
(Clouds, 354; Thesm. 574) as a lap and a profligate. (J. M. M.)

CLEITARBUS, one of the historians of Alexander the Great,
son of Deion, also an historian, was possibly a native of Egypt,
or at least spent a considerable time at the court of Ptolemy
Lagus. Quintilian (Inst. x. 1. 79) credits him with more
ability than trustworthyness, and Cicero (Brutus, 11) accuses
him of giving a fictitious account of the death of Themistocles.
But there is no doubt that his history was very popular, and
much used by Diodorus Siculus, Quintus Curtius, Justin and
Plutarch, and the authors of the Alexander romances. His
unnatural and exaggerated style became proverbial.

The fragments, some thirty in number, chiefly preserved in Aelian
and Strabo, will be found in C. Müller’s Scriptores Rerum Alexandrud
Magis (in the Didot Arrian, 1846); monographs by C. Radow, De
Cleitarchi Operibus I, 2, 1, 3 (1851), and J. J. Renan, "Hellenistische

CLEITRAL (Gr. κλειτράλ, an enclosed or shut-up place),
an architectural term applied to a covered Greek temple, in
contradistinction to hypaethral, which designates one which
is roofed; the cell of a cathedral temple completely covers it.

CLEITOR, or CLITOR, a town of ancient Greece, in that part of
Arcadia which corresponds to the modern eparchy of Kalavryta
in the nomos of Elis and Achaea. It stood in a fertile plain
to the south of Mt Chelmos, the highest peak of the Aroian
Mountains, and not far from a stream of its own name, which
joined the Aranous, or Katanae. In the neighbourhood was a
fountain, the waters of which were said to cure those who
drank of them the taste for wine. The town was a place of con-
siderable importance in Arcadia, and its inhabitants were noted
for their love of liberty. It extended over several
neighbouring towns, and in the Theban war fought against
Orchomenus. It joined the other Arcadian cities in the founda-
tion of Megalopolis. As a member of the Achaean league it
was besieged by the Aetolians in 220 b.c., and was on several
occasions the seat of the federal assemblies. It coined money
up to the time of Septimius Severus. The ruins, which bear
the common name of Paleopoli, or Old City, are still to be seen
about 3 m. from a village that preserves the ancient designation.
The greater part of the walls which enclose an area of about a
mile and several of the semi-circular towers with which they
were fortified, information to be obtained from The Clematis as a
Garden Flower, by Thos. Moore and George Jackman. See also
G. Nicholson, Dictionary of Gardening, i. (1858) and Supplements.
Clemenceau—Clement

Clemenceau, Georges (1841- ), French statesman, was born at Mouilleron-en-Paredes, Vendée, on the 28th of September 1841. Having adopted medicine as his profession, he settled in 1869 in Montmartre; and after the revolution of 1870 he had become sufficiently well known to be nominated mayor of the 18th arrondissement of Paris (Montmartre)—an unruly district over which it was a difficult task to preside. On the 8th of February 1871 he was elected as a Radical to the National Assembly for the department of the Seine, and voted—

against the peace preliminaries. The execution, or rather, murder, of Generals Lecomte and Clément Thomas by the communists on 15th March, which he vainly tried to prevent, brought him into collision with the central committee sitting at the hotel de ville, and they ordered his arrest, but he escaped; he was accused, however, by various witnesses, at the subsequent trial of the murderers (November 20th), of not having intervened when he might have done, and though he was cleared of this charge it led to a duel, for his share in which he was prosecuted and sentenced to a fine and a fortnight’s imprisonment.

Meanwhile, on the 20th of March 1871, he had introduced in the National Assembly at Versailles, on behalf of his Radical colleagues, a bill to establish by ordinary legislation the municipal council of the remaining eight districts; but he was not returned himself at the elections of the 26th of March. He tried with the other Paris mayors to mediate between Versailles and the hotel de ville, but failed, and accordingly resigned his mayoralty and his seat in the Assembly, and temporarily gave up politics; but he was elected to the Paris municipal council on the 23rd of July 1871 for the Clignancourt quarter, and retained his seat till 1876, passing through the offices of secretary and vice-president, and becoming president in 1875. In 1876 he stood again for the Chamber of Deputies, and was elected for the 18th arrondissement. He joined the Extreme Left, and his energy and mordant eloquence speedily made him the leader of the Radical section. In 1877, after the Seize Mai (see France: History), he was one of the republican majority who denounced the Broglie ministry, and he took a leading part in resisting the anti-republican policy of which the Seize Mai incident was a symptom, his demand in 1879 for the indictment of the Broglie ministry bringing him into particular prominence. In 1880 he started his newspaper, La Justice, which became the principal organ of Parian Radicalism; and from this time onwards throughout M. Grévy’s presidency his reputation as a political critic, and as a destroyer of ministries who yet would not take office himself, rapidly grew. He led the Extreme Left in the Chamber. He was an active opponent of M. Jules Ferry’s colonial policy and of the Opportunist party, and in 1885 it was his use of the Tongking disaster which principally determined the fall of the Ferry cabinet. At the elections of 1885 he advocated a strong Radical programme, and was returned both for his old seat in Paris and for the Var, selecting the latter. Refusing to form a ministry to replace the one he had overthrown, he supported the Right in keeping M. Freycinet in power in 1886, and was responsible for the inclusion of General Boulangier in the Freycinet cabinet as war minister. When Boulangier (q.v.) showed himself as an ambitious pretender, Clemenceau withdrew his support and became a vigorous combatant against the Boulangist movement, though the Radical press and a section of the party continued to patronize the general.

By his exposure of the Wilson scandal, and by his personal plain speaking, M. Clemenceau contributed largely to M. Grévy’s resignation of the presidency in 1887, having himself declined Grévy’s request to form a cabinet on the downfall of that of M. Rouvier; and he was primarily responsible, by advising his followers to vote neither for Floquet, Ferry nor Freycinet, for the election of an “outsider” as president in M. Carnot. He had arrived, however, at the height of his influence, and several factors now contributed to his decline. The split in the Radical party over Boulangism weakened his hands, and its collapse made his help unnecessary to the moderate republicans. A further misfortune occurred in the Panama affair, Clemenceau’s relations with Cornelius Herz leading to his being involved in the general suspicion; and, though he remained the leading spokesman of French Radicalism, his hostility to the Russian alliance so increased his unpopularity that in the election for 1893 he was defeated for the Chamber, after having sat in it continuously since 1876. After his defeat for the Chamber, M. Clemenceau confined his political activities to journalism, his career being further clouded—so far as any immediate possibility of regaining his old ascendancy was concerned—by the long-drawn-out Dreyfus case, in which he took an active and honourable part as a supporter of M. Zola and an opponent of the anti-Semitic and Nationalist campaign. In 1900 he withdrew from La Justice to found a weekly review, Le Bloc, which lasted until March 1902. On the 6th of April 1902 he was elected senator for the Var, although he had previously continually demanded the suppression of the Senate. He sat with the Socialist Radicals, and vigorously supported the Combes ministry. In June 1903 he undertook the direction of the journal L’Aurore, which he had founded. In it he led the campaign for the revision of the Dreyfus affair, and for the separation of Church and State.

In March 1906 the fall of the Rouvier ministry, owing to the refusal of the anti-clericals to support his measures of church property, at last brought Clemenceau to power as minister of the interior in the Sarrien cabinet. The strike of miners in the Pas de Calais after the disaster at Courrières, leading to the threat of disorder on the 1st of May 1906, obliged him to employ the military; and his attitude in the matter alienated the Socialist party, from which he definitely broke in his notable reply in the Chamber to Jean Jaurès in June 1906. This speech marked him out as the strong man of the day in French politics; and when the Sarrien ministry resigned in October, he became premier. During 1907 and 1908 his premiership was notable for the way in which the new entente with England was cemented, and for the successful part which France played in European politics, in spite of difficulties with Germany and attacks by the Socialist party in connexion with Morocco (see France: History). But on July 20th, 1909, he was defeated in a discussion in the Chamber on the state of the navy, in which bitter words were exchanged between him and Delcassé; and he at once resigned, being succeeded as premier by M. Briand, with a reconstructed cabinet.

Clemencín, Diego (1765-1824), Spanish scholar and politician, was born on the 27th of September 1765, at Murcia, and was educated there at the Colegio de San Fulgencio. Abandoning his intention of taking orders, he found employment at Madrid in 1788 as tutor to the sons of the countess-duchess de Benavente, and devoted himself to the study of archaeology. In 1807 he became editor of the Gaceta de Madrid, and in the following year was condemned to death by Murat for publishing a patriotic article; he fled to Cadiz, and under the Junta Central held various posts from which he was dismissed by the reactionary government of 1814. During the liberal régime of 1820-1823 Clemencín took office as colonial minister, was exiled till 1827, and in 1833 published the first volume of his edition (1833-1839) of Don Quixote. Its merits were recognized by his appointment as royal librarian, but he did not long enjoy his triumph: he died on the 30th of July 1834. His commentary on Don Quixote owes something to John Bowle, and is disfigured by a long, boring spirit; nevertheless it is the most valuable work of its kind, and is still unsuperseded. Clemencín is also the author of an interesting Elégio de la reina Isabel la Católica, published as the sixth volume of the Memorias of the Spanish Academy of History, to which body he was elected on the 12th of September 1800.

Clement (Lat. Clemens, i.e. merciful; Gr. Κλήμεντος), the name of fourteen popes and two anti-popes.

Clement I., generally known as Clement of Rome, or Clemens Romanus (flor. c. A.D. 60), was one of the “Apostolic Fathers,” and in the lists of bishops of Rome is given the third or fourth place—Peter, Linus, (Anencletus), Clement. There is no ground for identifying him with the Clement of Phil. iv. 3. He may have been a freedman of T. Flavius Clemens, who was consul
with his cousin, the Emperor Damiat, in A.D. 95. A 9th-century tradition says he was martyred in the Crimea in 102; early authorities say he died of natural death; he is commemorated on the 23rd of November.

In The Shepherd of Hermas (g.s.) (Vis. 11, iv. 3) mention is made of one Clement whose office it is to communicate with other churches, and this function agrees well with what we find in the letter to the church at Corinth by which Clement is best known. Whilst being on our guard against reading later ideas into the title "bishop" as applied to Clement, there is no reason to doubt that he was one of the chief personalities in the Christian community at Rome, where since the time of Paul the separate house congregations (Rom. xvi.) had been united into one church officered by presbyters and deacons (Clem. 40-42). The letter in question was occasioned by a dispute in the church of Corinth, which had led to the election of several presbyters from their office. It does not contain Clement's name, but is addressed by "the Church of God which sojourneth in Rome to the Church of God which sojourneth in Corinth." But there is no reason for doubting the universal tradition which ascribes it to Clement, or the generally accepted date, c. A.D. 96. No claim is made by the Roman Church to interfere on any ground of superior rank; yet it is noteworthy that in the earliest document outside the canon which we can securely date, the church in the imperial city comes forward as a peacemaker to compose the troubles of a church in Greece. Nothing is known of the cause of the discontent; no moral offence is charged against the presbyters, and their dismissal is regarded by Clement as high-handed and unjustifiable, and as a revolt of the younger members of the community against the elder. After a laudatory account of the past conduct of the Corinthian Church, he enters upon a denunciation of vices and a praise of virtues, and illustrates his various topics by copious citations from the Old Testament scriptures. Thus he paves the way for his tardy rebuke of present disorders, which he reserves until toward the close of the letter. Clement is exceedingly discursive, and his letter reaches its strength and purpose in the last battle to the Hebrews. Many of his general exhortations are very indirectly connected with the practical issue to which the epistle is directed, and it is very probable that he was drawing largely upon the homiletical material with which he was accustomed to edify his fellow-Christians at Rome.

This view receives some support from the long liturgical prayer at the close, which almost certainly represents the intercession used in the Roman eucharist. But we must not allow such a theory to blind us to the true wisdom with which the writer defers his censure. He knows that the roots of the quarrel lie in a wrong condition of the church's life. His general exhortations, courteously expressed in the first person plural, are directed toward a wide reformation of manners. If the wrong spirit can be exorcised, there is hope that the quarrel will end in a general desire for reconciliation. The most permanent interest of the epistle lies in the conception of the grounds on which the Christian ministry rests according to the view of a prominent teacher before the 1st century has closed. The orderliness of nature is appealed to as expressing the mind of its Creator. The orderliness of Old Testament worship bears a like witness; everything is duly fixed by God; high priests, priests and Levites, and the people in the people's place. Similarly in the Christian dispensation all is in order due. "the apostles preached the gospel to us from the Lord Jesus Christ; Jesus Christ was sent from God. Christ then is from God, and the apostles from Christ. . . . They appointed them by the Spirit, as bishops and deacons of those who should believe. . . . Our apostles knew through our Lord Jesus Christ that there would be strife about the name of the bishop's office. For this cause therefore, having received perfect foreknowledge, they appointed the aforesaid, and afterward signified it in a further injunction (e.g.) (late) has now the further evidence of the Latin legend) that, if these should fall asleep, other approved men should succeed to their ministry. . . . It will be no small sin in us if we eject from the bishop's office those who have offered the gifts blamelessly and holily (cc. xlvii., xlviii.)."

Clement's familiarity with the Old Testament points to his being a Christian of long standing rather than a recent convert. We learn from his letter (i. 7) that the church at Rome, though suffering persecution, was firmly held together by faith and love, and was exhibiting its unity in an orderly worship. The epistle was publicly read from time to time at Corinth, and by the 4th century this usage had spread to other churches. We even find it attached to the famous Alexandrian MS. (Codex A) of the New Testament, but this does not imply that it ever reached canonical rank. For the mass of early Christian literature that was gradually attached to his name see Clementine Literature.

The epistle was published in 1633 by Patrick Young from Cod. Alexandrinus, in which a leaf near the end was missing, so that the great part (cc. iv.-xiv.) remained unknown. In 1875 (six years after J. B. Lightfoot's edition) a complete text from the MS. in Constantinople (dated 1585), from which in 1893 he gave us the Didache. In 1876 R. L. Bendly found a complete Syriac text in a MS. recently obtained by the University library at Cambridge. Lightfoot made use of these new materials in an Appendix (1877); his second edition, on which he had been at work at the time of his death, came out in 1890. This must remain the standard edition, notwithstanding Dom Morin's most successful discovery of a new version (1894), which was probably made in the 3rd century, and is a valuable addition to the authorities for the text. Its evidence is used in a small edition of the epistle by R. Knopf (Leipsic, 1899). See also W. Wrede, Unternehmung Pauls nach Griechenland (1897). The most complete edition is that of the New Testament (Berlin, 1877), published with the Greek text in Hefele's Harris edition (1899).

CLEMENT (II.) (Suider) became pope on the 25th of December 1046. He belonged to a noble Saxon family, was bishop of Bamberg, and chancellor to the emperor Henry III., to whom he was indebted for his elevation to the papacy upon the abdication of Gregory VI. He was the first pope placed on the throne by the power of the German emperors, but his short pontificate was only signalized by the convocation of a council in which decrees were enacted against simony. He died on the 9th of October 1047, and was buried at Bamberg.

CLEMENT (III.) (Paolo Scolari), pope from 1187 to 1191, a Roman, was made cardinal bishop of Palestrina by Alexander III. in 1180 or 1181. On the 10th of December 1187 he was chosen at Pisa to succeed Gregory VIII. On the 31st of May 1188 he concluded a treaty with the Romans which removed difficulties of long standing, and in April 1189 he made peace with the emperor Barbarossa. He was settled at Rome by the assembly of Scotland concerning the choice of the archbishop of St Andrews, and on the 13th of March 1188 removed the Scottish church from under the legatine jurisdiction of the archbishop of York, thus making it independent of all save Rome. In spite of his conciliatory policy, Clement angered Henry VI. of Germany by bestowing Sicily on Tancrèd. The crisis was acute when the pope died, probably in the latter part of March 1191.

CLEMENT IV. (Guil Foulques), pope from 1265 to 1268, son of a successful lawyer and judge, was born at St Gilles-sur-Rhône. He studied law, and became a valued adviser of Louis IX. of France. He married, and was the father of two daughters, but after the death of his wife took orders. In 1257 he became bishop of Le Puy; in 1259 he was elected archbishop of Narbonne; and on the 24th of December 1261 Urban IV. created him cardinal bishop of Sabina. He was appointed legate in England on the 22nd of November 1263, and before his return was elected pope at Perugia on the 5th of February 1265. On the 26th of February he invested Charles of Anjou with the kingdom of Sicily; but subsequently he came into conflict with Charles, especially after the death of Manfred in February 1266. To the cruelty and avarice of Charles he opposed a generous humanity. When Charles, after the last of the Hohenstaufen, appeared in Italy the pope excommunicated him and his supporters, but it is improbable that he was in the remotest degree
CLEMENT (POPE)

responsible for his execution. At Viterbo, where he spent most of his pontificate, Clement died on the 29th of November 1348, leaving a name unsullied by nepotism. As the benefactor and protector of Roger Bacon he has a special title to the gratitude of posterity.

Clement V. (Bertrand de Gouth), pope from 1305 to 1314, was born of a noble Gascon family about 1264. After studying the arts at Toulouse and law at Orleans and Bologna, he became a cardinal at Bordeaux and then vicar-general to his brother the archbishop of Lyons, who in 1294 was created cardinal bishop of Albano. Bertrand was made a chaplain to Boniface VIII., who in 1295 nominated him bishop of Comminges (Haute Garonne), and in 1299 translated him to the archbishopric of Bordeaux. Because he attended the synod at Rome in 1302 in the controversy between France and the Pope, he was considered a supporter of Boniface VIII., yet was by no means unfavourably regarded at the French court. At Perugia on the 5th of June 1305 he was chosen to succeed Benedict XI.; the cardinals by a vote of ten to five electing one neither an Italian nor a cardinal, in order to end a conclave which had lasted eleven months. The chronicler Villani relates that Bertrand owned a property to a secret agreement with Philip IV., and when he was in Saintonge, the pope may have been disassembled as gossip, but it is probable that the future pope had to accept certain conditions laid down by the cardinals. At Bordeaux Bertrand was formally notified of his election and urged to come to Italy; but he excused himself to take place at Lyons on the 14th of November 1305. From the beginning Clement V. was subservient to French interests. Among his first acts was the creation of nine French cardinals. Early in 1306 he modified or explained away those features of the bull Clerici Laicos et Unam sanctam which were particularly offensive to the king. Most of the year 1306 he spent at Bordeaux because of ill-health; subsequently he resided at Poitiers and elsewhere, and in March 1309 the entire papal court settled at Avignon, an imperial fief held by the king of Sicily. Thus began the seventy years "Babylonian captivity of the Church." On the 13th of October 1307 came the arrest of all the Knights Templar in France, the breaking of a storm conjured up by royal jealousy and greed. From the very day of Clement's consecration the king had charged the Templars with heresy, immorality and abuses, and the scruples of the weak pope were at length overcome by apprehension lest the State should not wait for the Church, but should proceed independently against the alleged heretics, as well as by the royal threats of pressing the accusation of heresy against the late Boniface VIII. In pursuance of the king's wishes Clement summoned the council of Vienne (see Vienne, Concil 09), which was unable to conclude that the Templars were guilty of heresy. The pope abolished the order, however, as it seemed to be in bad repute and had outlived its usefulness. Its French estates were granted to the Hospitaliers, but actually Philip IV. held them until his death.

In his relations to the Empire Clement was an opportunist. He refused to use his full influence in favour of the candidacy of Charles of Valois, brother of Philip IV., lest France became too powerful; and recognized Henry of Luxemburg, whom his representatives crowned emperor at the Lateran in 1312. When Henry, however, came into conflict with Robert of Naples, Clement supported Robert and threatened the emperor with ban and interdict. But the crisis passed with the unexpected death of Henry, soon followed by the death of the pope on the 20th of April 1314 at Roquemaure-sur-Rhône. Though the sale of offices and oppressive taxation which disgraced his pontificate may in part be explained by the desperate condition of the papal finances and by his saving up gold for a crusade, nevertheless he indulged in unbecoming pomp. Showing favouritism toward his family and his nation, he brought untold disaster on the Church.

(W. W. R.)

Clement VI. (Pierre Roger), pope from the 7th of May 1342 to the 6th of December 1352, was born at Maumont in Limousin in 1291, the son of the wealthy lord of Rosières, entered the Benedictine order as a boy, studied at Paris, and became successively prior of St Baudel, abbot of Fécamp, bishop of Arras, chancellor of France, archbishop of Sens and archbishop of Rouen. He was made cardinal-priest of St Nero and archdeacon and administrator of the bishopric of Avignon by Benedict XII. in 1338, and four years later succeeded him as pope. He continued to reside at Avignon despite the demands of envos and the verses of Petrarch, but threw a sop to the Romans by reducing the jubilee hospital, started one hundred years to fifty. He allowed Cola di Rienzo to a civil position at Rome, and, although at first approving the establishment of the tribunate, he later sent a legate who excommunicated Rienzo and, with the help of the aristocratic faction, drove him from the city (December 1347). Clement continued the struggle of his predecessors with the emperor Louis the Bavarian, excommunicating him after protracted negotiations on the 13th of April 1346, and directing the election of Charles of Moravia, who received general recognition after the death of Louis in October 1347, and put an end to the schism which had long divided Germany. Clement proclaimed a crusade in 1343, but nothing was accomplished beyond a naval attack on Smyrna (29th of October 1344). He also carried on fruitless negotiations for church unity with the Armenians and with the Greek emperor, John Cantacucenus. He tried to end the Hundred Years' War between England and France, but secured only a temporary truce. He communicated Casimir of Poland for marital infidelity and forced him to do penance. He successfully resisted encroachments on ecclesiastical jurisdiction by the kings of England, Castile and Aragon. He again excommunicated an archbishop in 1344, and three years later founded the university there. During the disastrous plague of 1347-1348 Clement did all he could to alleviate the distress, and condemned the Flagellants and Jew-baiters. He tried to do away with the murder of her husband and acquired her. He secured full ownership of the county of Avignon through purchase from Queen Joanna (9th of June 1348) and renunciation of feudal claims by Charles IV. of France, and consideredably enlarged the papal palace in that city. To supply money for his many undertakings Clement revived the practice of selling reservations and expectations, which had been abolished by his predecessor. Oppressive taxation and unblushing nepotism were Clement's great faults. On the other hand, he was famed for his engaging manners, eloquence and theological learning. He died on the 6th of December 1352, and was buried in the Benedictine abbey at Avurvre, but his body was destroyed by Calvinists in 1562. His successor was Innocent VI.

The chief sources for the life of Clement VI. are in Balzulius, Vitae Popum Romanorum, vol. ii. (Paris, 1693); E. Weunsky, Exscripta ex registris Clementis VI. et Innocentii VI. (Innsbruck, 1888); and F. Cerasoli, Clemente VI. e Giovani I. di Napoli—Documenti inedit di Archivo Vaticano, (1890, 2nd ed., 1893); F. E. E. West, History of the Popes, vol. i., trans. by F. I. Antrobus (London, 1899); J. F. Gregorovius, Rome in the Middle Ages, vol. vi., trans. by Mrs G. W. Hamilton (London, 1900-1902); J. B. Christophie,
Histoire de la papauté pendant le XIVe siècle, vol. ii. (Paris, 1852); also article by L. Küpper in the Kirchenlexikon (2nd ed.). (C. H. Ha.)

CLEMENT VII. (Robert of Geneva), (d. 1394), antipope, brother of Peter, count of Genevois, was connected by blood or marriage with most of the sovereigns of Europe. After occupying the episcopal sees of Thérouanne and Cambrai, he attained to the cardinalate at an early age. In 1377, as legate of Pope Gregory XI. in the Romagna, he directed, or rather assisted in, the savage suppression of the revolt of the inhabitants of Cesena against the papal authority. In the following year he took part in the election of Pope Urban VI. at Rome, and was perhaps the first to express doubts as to the validity of that tumultuous election. After withdrawing to Fossi to reconsider the election, the cardinals finally resolved to regard Urban as an intruder and the Holy See as still vacant, and an almost unanimous vote was given in favour of Robert of Geneva (20th of September 1378), who took the name of Clement VII. Thus originated the Great Schism of the West.

To his high connexions and his adroitness, as well as to the gross mistakes of his rival, Clement owed the immediate support of Queen Joanna of Naples and of several of the Italian barons; and the king of France, Charles V., who seems to have been sound beforehand on the choice of the Roman pontiff, soon became his warmest protector. Clement eventually succeeded in winning to his cause Scotland, Castile, Aragon, Navarre, a great part of the Latin East, and Flanders. He had adherents, besides, scattered through Germany, while Portugal on two occasions acknowledged him, but afterwards forsook him. From Avignon, however, where he had immediately fixed his residence, his eyes were always turned towards Italy, his purpose being to wrest Rome from his rival. To attain this end he lavished his gold—or rather the gold provided by the clergy in his obedience—without stint, and conceived a succession of the most adventurous projects, of which one at least was to leave a lasting mark on history.

By the aid of a kingdom to be carved expressly out of the States of the Church and to be called the kingdom of Adria, coupled with the expectation of succeeding to Queen Joanna, Clement incited Louis, duke of Anjou, the eldest of the brothers of Charles V., to take arms in his favour. These tempting offers gave rise to a series of expeditions into Italy carried out almost exclusively at Clement's expense, in the first of which Louis lost his life. These enterprises on several occasions planted Angevin domination in the south of the Italian peninsula, and their most decisive result was the assurance of Provence to the dukes of Anjou and afterwards to the kings of France. After the death of Louis, Clement hoped to find equally brave and interested champions in Louis' son and namesake; in Louis of Orléans, the brother of Charles VI.; in Charles VI. himself; and in John III., count of Armagnac. The prospect of his brilliant progress to Rome was ever before his eyes; and in his thoughts force of arms, of French arms, was to be the instrument of his glorious triumph over his competitor.

There came a time, however, when Clement and more particularly his following had to acknowledge the vanity of these illusive dreams; and before his death, which took place on the 16th of September 1394, he realized the impossibility of overcoming by brute force an opposition which was founded on the convictions of the greater part of Catholic Europe, and discerned among his adherents the germs of disaffection. By his vast expenditure, ascribable not only to his wars in Italy, his incessant embassies, and the necessity of defending himself in the Comtat Venaissin against the incursions of the adventurous Raymond of Turenne, but also to his luxurious tastes and princely habits, as well as by his persistent refusal to refer the question of the schism to a council, he incurred general reproach. Unity was the crying need; and men began to fasten upon him the responsibility of the hateful schism, not on the score of insincerity—which would have been very unjust—but by reason of his obstinate persistence in the course he had chosen.

See N. Valois, La France et le grand schisme d'occident (Paris, 1896).

CLEMENT VII. (Giulio de' Medici), pope from 1523 to 1534, was the son of Giuliano de' Medici, assassinated in the conspiracy of the Pazzi at Florence, and of a certain Fioretta, daughter of Antonia. Being left an orphan he was taken into his own house by Lorenzo the Magnificent and educated with his sons. In 1494 Giulio went with them into exile; but, on Giovanni's restoration to power, returned to Florence, of which he was made archbishop by his cousin Pope Leo X., a special dispensation being granted on account of his illegitimate birth, followed by a formal declaration of the fact that his parents had been secretly married and that he was therefore legitimate. On the 23rd of September 1513 the pope conferred on him the title of cardinal and made him legate at Bologna. During the reign of the pleasure-loving Leo, Cardinal Giulio had practically the whole papal government in his hands and displayed all the qualities of a good administrator; and when, on the death of Adrian VI.—whose election he had done most to secure—he was chosen pope (Nov. 18, 1522), his accession was hailed as the dawn of a happier era. It soon became clear, however, that the qualities which had made Clement an excellent second in command were not equal to the exigencies of supreme power at a time of peculiar peril and difficulty.

Though free from the grosser vices of his predecessors, a man of taste, and economical without being avaricious, Clement VII. was essentially a man of narrow outlook and interests. He failed to understand the great spiritual movement which was convulsing the Church; and instead of bending his mind to the problem of the Reformation, he from the first subordinated the cause of Catholicism and of the world to his interests as an Italian prince and a Medici. Even in these purely secular affairs, moreover, his timidity and indecision prevented him from pursuing a consistent policy; and his ill fortune, or his lack of judgment, placed him, as long as he had the power of choice, ever on the losing side.

Clement's accession at once brought about a political change in favour of France; yet he was unable to take a strong line, and wavered between the emperor and Francis I., concluding a treaty of alliance with the French king, and then, when the crushing defeat of Pavia had shown him his mistake, making his peace with Charles (April 1, 1525), only to break it again by censuring Girolamo Morone's League of Freedom, of which the aim was to assert the independence of Italy from foreign powers. On the betrayal of this conspiracy Clement made a fresh submission to the emperor, only to follow this, a year later, by the Holy League of Cognac with Francis I. (May 22, 1526). Then followed the imperial invasion of Italy and Bourbon's sack of Rome (May 1527) which ended the Augustan age of the papal city in a horror of fire and blood. The pope himself was besieged in the castle of St Angelo, compelled on the 6th of June to ransom himself with a payment of 400,000 scudi, and kept in confinement until, on the 26th of November, he accepted the emperor's terms, which besides money payments included the promise to convene a general council to deal with Lutheranism. On the 6th of December Clement escaped, before the day fixed for his liberation, to Orvieto, and at once set to work to establish peace. After the signature of the treaty of Cambrai on the 3rd of August 1529 Charles met Clement at Bologna and received from him the imperial crown and the iron crown of Lombardy. The pope was now restored to the greater part of his temporal power; but for some years it was exercised in subservience to the emperor. During this period Clement was mainly occupied in urging Charles to arrest the progress of the Reformation in Germany and in efforts to elude the emperor's demand for a general council, which Clement feared lest the question of the mode of his election and his legitimacy should be raised. It was due to his dependence on Charles V. rather than to any conscientious scruples, that Clement evaded Henry VIII.'s demand for the nullification of his marriage with Catherine of Aragon, and so brought about the breach between England and Rome. Some time before his death, however, the dynastic interests of his family led him once more to a rapprochement with France. On the 9th of June 1531 an agreement was
signed for the marriage of Henry of Orleans with Catherine de' Medici; but it was not till October 1533 that Clement met Francis at Marseille, the wedding being celebrated on the 27th.

Before, however, the new political alliance, thus cemented, could take effect, Clement died, on the 29th of September 1534.

Clement VIII. (Aegidius Muñoz), antipope from 1425 to the 26th of July 1429, was a canon at Barcelona until elected at Peñiscola by three cardinals whom the stubborn antipope Benedict XIII. had named on his death-bed. Clement was immediately recognized by Alphonso V. of Aragon, who was hostile to Pope Martin V. on account of the latter's opposition to his claims to the kingdom of Naples, but abdicated as soon as an agreement was reached between Alphonso and Martin through the exertions of Cardinal Pierre de Foix, an able diplomat and relation of the king. Clement spent his last years as bishop of Majorca, and died on the 28th of December 1465.

Clement VIII. (Ippolito Aldobrandini), pope from 1592 to 1605, was born at Fano, in 1535. He became a jurist and filled several important offices. In 1588 he was made a cardinal, and subsequently discharged a delicate mission to Poland with skill. His moderation and experience commended him to his fellow cardinals, and on the 30th of January 1592 he was elected pope, to succeed Innocent IX. While not hostile to Philip II., Clement desired to emancipate the papacy from undue Spanish influence, and to that end cultivated closer relations with France. In 1595 he granted absolution to Henry IV., and removed the last objection to the acknowledgment of his legitimacy. The peace of Vervins (1598), which marked the beginning of Philip's great war, was mainly the work of the pope. Clement also entertained the hope of recovering England. He corresponded with James I. and with his queen, Anne of Denmark, a convert to Catholicism. But James was only half in earnest, and, besides, dared not risk a breach with his subjects. Upon the failure of the line of Este, Clement claimed the reversion of Ferrara and reincorporated it into the States of the Church (1598). He remonstrated against the exclusion of the Jesuits from France, and obtained their readmission. But in their doctrinal controversy with the Dominicans (see MOLINA, Luis) he refrained from a decision, being unwilling to offend either party. Under Clement the publication of the revised edition of the Vulgate, begun by Sixtus V., was finished; the Breviary, Missal and Pontifical received certain corrections; the Index was expanded; the Vatican library enlarged; and the Collegium Clementinum founded. Clement was an unblushing nepotist; three of his nephews he made cardinals, and to one of them gradually surrendered the control of affairs. But on the other hand those who were for him, and stood in the path of the advance of foreigners were at the same time expelled, as Caraffa, Bellarmine and Toledo. During this pontificate occurred the burning of Giordano Bruno for heresy; and the tragedy of the Cenci (see the respective articles). Clement died on the 5th of March 1605, and was succeeded by Leo XI.

See the controversial life by Ciacconius, Vitae et res gestae ssummarum Pontif. Rom. (Rome, 1601-1602); Francolinii, Ippolito Aldobrandini, che fu Clemente VIII. (Perugia, 1867); Ranke's excellent sketch, Pontifik. (Eng. trans. Austin), ii. 234 seq. v. Reumont, Gesch. der Stadt Rom, iii. 2, 592 seq.; Brosch, Gesch. des Kirchentumes (1880), i. 301 seq.

Clement IX. (Giulio Rospigliosi) was born in 1600, became successively auditor of the Rota, archbishop of Tarsus in partibus, and cardinal, and was elected pope on the 20th of June 1667. He affected to be ministerial; to the opulent spirit of the papal controversy, he was instrumental in concluding the peace of Aix-la-Chapelle (1668); healed a long-standing breach between the Holy See and Portugal; aided Venice against the Turks, and laboured unceasingly for the relief of Crete, the fall of which hastened his death on the 9th of October 1669.

Clement X. (Emilio Altiere) was born in Rome, on the 13th of July 1590. Before becoming pope, on the 29th of April 1670 he had been auditor in Poland, governor of Ancona, and nuncio in Naples. His advanced age induced him to resign the control of affairs to his adopted nephew, Cardinal Paluzzi, who embroi ded the papacy in disputes with the resident ambassadors, and incurred the enmity of Louis XIV., thus provoking the long controversy over the regalia (see INNOCENT XI.). Clement died on the 22nd of July 1676.

Clement XI. (Giovanni Francesco Albani), pope from 1700 to 1721, was born in Urbino, on the 22nd of July 1649, received an extraordinary education in letters, theology and law, filled various important offices in the Curia, and finally, on the 23rd of November 1700, succeeded Innocent XII. as pope. His private life and his administration were blameless, but it was his fortune to reign in troublous times. In the war of the Spanish Succession he would willingly have remained neutral, but found himself between two fires, forced first to recognize Philip V., then driven by the emperor to recognize the Archduke Charles. In the peace of Utrecht he was ignored; Sardinia and Sicily, Parma and Piacenza, were disposed of without regard to papal claims. When he died, recently elected with the support of his Jansenist allies, his inheritance rights in Sicily (1715), his interdict was treated with contempt. The prestige of the papacy had hardly been lower within two centuries. About 1702 the Jansenist controversy broke out afresh. Clement reaffirmed the infallibility of the pope, in matters of fact (1705), and, in 1713, issued the bull Unigenitus, condemning 101 Jansenistic propositions extracted from the Moral Reflections of Pasquier Quesnel. The rejection of this bull by certain bishops led to a new party division and a further prolonging of the controversy (see Jansenism and QUESNEL, PASQUIER). Clement also forbade the practice of the Jesuit missionaries in China of "accommodating" their teachings to pagan notions or customs, in order to win converts. Clement was a polished writer, and a generous patron of art and letters. He died on the 10th of March 1721.

Clement XII. (Lorenzo Corsini), pope from 1730 to 1740, succeeded Benedict XIII. on the 12th of July 1730, at the age of seventy-eight. The rascally Cardinal Corsia, who had deluded Benedict, was at once brought to justice and forced to disgorge his dishonest gains. Politically the papacy had sunk to the level of pitiful helplessness, unable to resist the aggressions of the Powers, who ignored or coerced it at will. Yet Clement....
entertained high hopes for Catholicism; he laboured for a union with the Greek Church, and was ready to facilitate the return of the Protestants of Saxony. He deserves well of posterity for his services to learning and art: the suppression of the Arch of Constantine, the restoration of the Capitoline museum with antique marbles and inscriptions, and of the Vatican library with oriental manuscripts (see ASSEMANI); and the embellishment of the city with many buildings. He died on the 6th of February 1740, and was succeeded by Benedict XIV.

CLEMENT XIII. (Carlo della Torre Rezzonico), pope from 1738 to 1769, was born in Venice, on the 7th of March 1695, filled various important posts in the Curia, became cardinal in 1737, bishop of Padua in 1743, and succeeded Benedict XIV. as pope on the 6th of July 1745. He was a man of upright and moderate passions, but his pontificate of twelve years was anything but tranquil. The Jesuits had fallen upon evil days; in 1758 Pombal expelled them from Portugal; his example was followed by the Bourbon countries—France, Spain, the Two Sicilies and Parma (1764-1768). The order turned to the pope as its natural protector; but his protests (cf. the bull Apostolicum passendi munus, 7th of January 1762) were unheeded (see JESUITS). A clash with Parma occurred to aggravate his troubles. The Bourbon kings espoused their relative's quarrel, seized Avignon, Benevento and Ponte Corvo, and united in a peremptory demand for the suppression of the Jesuits (January 1769). Driven to extremities, Clement consented to call a Consistory to consider the step, but on the very eve of the day set for its meeting he died (2d of February 1769), without suspicion of poison, of which, however, there appears to be no conclusive evidence.

A contemporary account of Clement was written by Augustin de Andrés y Sobřas, . . . el nacimiento, estudios y empleos de . . . Clem. XIII. (Madrid, 1759). Raviggi's Clemente XIII. e Clemente XIV. (Paris, 1854) is partition but free from rancour; and appends many interesting documents. See also the bibliographical note under Clement XIV. infr.; and the extended bibliography in Hergenröther, Allg. Kirchengesch. (1880), iii. 509.

CLEMENT XIV. (Lorenzo Ganganelli), pope from 1769 to 1774, son of a Physician of St. Arcangelo, near Rimini, was born on the 31st of October 1705, entered the Franciscan order at the age of seventeen, and became a teacher of theology and philosophy. As regent of the college of S. Bonaventura, Rome, he came under the eye of Clement XIII. and was instructed in his high estimation of his talents and made him consulter of the Inquisition. Upon the recommendation of Ricci, general of the Jesuits, Clement XIII. made him a cardinal; but, owing to his disapproval of the pope's policy, he found himself out of favour and without influence. The conclave following the death of Clement XIII. was the most momentous of at least two centuries. The fate of the Jesuits hung in the balance; and the Bourbon princes were determined to have a pope subservient to their hostile designs. The struggle was prolonged three months. At length, on the 9th of May 1769, Ganganelli was chosen, not as a declared enemy of the Jesuits, but as being least objectionable to each of the contending factions. The charge of simony was inspired by Jesuit hatred; there is absolutely no evidence that Ganganelli pledged himself to suppress the order.

The unexpectedly large papal majority was regarded with a patriarchate; France held Avignon; Naples held Ponte Corvo and Benevento; Spain was ill-affected; Parma, defiant; Venice, aggressive; Poland meditating a restriction of the rights of the nuncio. Clement realized the imperative necessity of conciliating the powers. He suspended the public reading of the bull In Coena Domini, so obnoxious to civil authority; resumed relations with Portugal; revoked the monitorium of his predecessor against Parma. But the powers were bent upon the destruction of the Jesuits, and they had the pope at their mercy. Clement looked abroad for help, but found none. Even Maria Theresa, his last hope, suppressed the order in Austria.

Temporizing and partial concessions were of no avail. At last, convinced that the peace of the Church demanded the sacrifice, Clement signed the brief Dominus ac Redemptor, dissolving the order, on the 21st of July 1773. The powers at once gave substantial proof of their satisfaction; Benevento, Ponte Corvo, Avignon and the Venetians were restored to the Holy See. But it would be unfair to accept this as evidence of a bargain. Clement had formerly indignantly rejected the suggestion of such an exchange of favours.

There is no question of the legality of the pope's act; whether he was morally culpable, however, continues to be a matter of bitter controversy. On the one hand, the suppression is denounced as a base surrender to the forces of tyranny and irreligion, an act of treason to conscience, which reaped its just punishment of remorse; on the other hand, it is ardently maintained that Clement acted in full accord with his conscience, and that the order merited its fate by its own mischievous activities which made it an offence to religion and authority alike. But whatever the guilt or innocence of the Jesuits, and whether their suppression were ill-advised or not, there appears to be no ground for impeaching the motives of Clement, or of doubting that he had the approval of his conscience. The stories of his having swooned after signing the brief, and of having lost hope and even reason, are too absurd to be entertained. The decline in health, which set in shortly after the suppression, and his death (on the 22nd of September 1774) proceeded from wholly natural causes. The testimony of his physician and of his confessor ought to be sufficient to discredit the oft-repeated story of slow poisoning (see Duhr, Jesuiten Fabeln, 4th ed., 1904, pp. 69 seq.).

The suppression of the Jesuits bulks so large in the pontificate of Clement that he has scarcely been given due credit for his praiseworthy attempt to reduce the burdens of taxation and to reform the financial administration, nor for his liberal encouragement of art and learning, of which the Museum Pio-Clementino is a lasting monument.

No pope has been the subject of more diverse judgments than Clement XIV. Zealous defenders credit him with all virtues, and bless him as the instrument divinely ordained to restore the peace of the Church; virulent detractors charge him with ingratitude, cowardice and double-dealing. The truth is at neither extreme. Clement's was a deeply religious and poetical nature, animated by a lofty and refined spirit. Gentleness, equanimity and benevolence were native to him. He cherished high purposes and obeyed a lively conscience. But he instinctively shrank from open conflict; he balanced the probabilities and the sternness of courage that grapples with a crisis.

Caraccioli's Vie de Clement XIV (Paris, 1775) (freq. translated), is incomplete, uncritical and too laudatory. The middle of the 19th century saw quite a spirited controversy over Clement XIV.; V. de Saint-Firmin, in his Histoire de la chaise des Jésuites (Paris, 1846), represented Clement as lamentably, almost culpably, weak; Creteau-Joly, in his Histoire du Congé de Jésus (Paris, 1844-1845, and his Clément XIV. et les Jésuites (Paris, 1847), was outspoken and bitter in his condemnation; this provoked Theiner's Gesch. des Pontifikats Clemens' XIV. (Leipzig, 1848); whose work, by being in the original Latin, was necessarily deficient. Theiner compiled his book from original documents to which, as custodian of the Vatican archives, the author had free access; Creteau-Joly replied with Le Pape Clément XIV; Lettres (Paris, 1852). Raviggi's Clemente XIII. e Clemente XIV. (Paris, 1854) is a weak, ugly, and heartless apology for Clement XIV. See also v. Reumont, Ganganelli, Papst Clemens XIV. Berlin (1847); and Reinhard, Clemens XIV. u. d. Aufhebung der Gesellschaft Jesu (Augsburg, 1854). The letters of Clement have frequently been printed; the gentleness of Caraccioli's collection (Paris, 1876; freq. translated) has been questioned, but most of the letters are now generally accepted, and see also Mittheilungen der XV. Epp. acc. Brinv. ed. Theiner (Paris, 1982). An extended bibliography is to be found in Hergenröther, Allg. Kirchengesch. (1880), iii. 510 seq.

CLEMENT OF ALEXANDRIA (Clemens Alexandrinus), Greek Father of the Church. The little we know of him is mainly derived from his own works. He was probably born about A.D. 150 of heathen parents in Athens. The earliest writer after himself who gives us any information with regard to him is Eusebius. The only points on which his works now existent inform us are his date and his instructors.
while attempting to show that the Jewish Scriptures were older than any writings of the Greeks, he invariably brings down his dates to the death of Commodus, a circumstance which at once suggests that he wrote in the reign of the emperor Severus, from 193 to 211 A.D. (see Ström. lib. i. cap. xxi. p. 403, Potter's edition). The passage in regard to his teachers is corrupt, and the sense is therefore doubtful (Ström. lib. i. cap. i. p. 322, P.).

This treatise," he says, speaking of the Stromataes," has not been printed for mere display, but memoranda are treasured up in it for my old age to be a remedy for forgetfulness,—an image, truly, and a true picture of the things which were in my time seen and heard. My truly blessed and beloved one, Eusebius, was my hope. One of these was in Greece, the other was in Magna Graecia; the one of them was from Coele Syria, the other from Egypt; but there were others, each in his position, of whom we shall speak more particularly. The last of these whom I met was first in power. On falling in with him I found rest, having tracked him while he lay concealed in Egypt. He was in truth the Sicilian bee, and, plucking the flowers of the profane and apocryphal meadow, he produced a wonderfully pure knowledge in the souls of the listeners.

Some have supposed that in this passage seven teachers are named, others that there are only five, and various conjectures have been hazarded as to what persons were meant. The only one about whom conjecture has any basis for speculating is the last, for Eusebius states (H.E. v. 11) that Clement made mention of Pantaenus as his teacher in the Hypotyposes. The reference in this passage is plainly to one whom he might well designate as his teacher.

To the information which Clement here supplies subsequent writers add little. By Eusebius and Photius he is called Titus Flavius Clemens, and "the Alexandrian" is added to his name. But Eusebius tells us that some say Clement was an Athenian, others that he was an Athenian (Hae. xxii. 6), and others imagined that he reconciled this discordance by the supposition that he was born at Athens, but lived at Alexandria. We know nothing of his conversion except that he passed from heathenism to Christianity. This is expressly stated by Eusebius (Propep. Evang. lib. ii. cap. 2), though it is likely that Eusebius had no other authority than the works of Clement. These works, however, warrant the inference. They show a singularly minute acquaintance with the ceremonies of pagan religion, and there are indications that Clement himself had been initiated in some of the mysteries (Propep. cap. ii. sec. 14, p. 13, P.). There is no means of determining the date of his conversion. He attained the position of presbyter in the church of Alexandria (Eus. H.E. vi. 11, and Jerome, De Vir. Ill. 38), and became perhaps the assistant, and certainly the successor of Pantaenus in the catechetical school of that place. Among his pupils were Origen (Eus. H.E. vi. 7) and Alexander, bishop of Jerusalem (Eus. H.E. vi. 7). For a long time he continued in Alexandria, and when and where he died, are all matters of pure conjecture. The only further notice of Clement that we have in history is in a letter written in 211 by Alexander, bishop of Jerusalem, to the Antiochians, and preserved by Eusebius (H.E. vi. 11). The words are as follows:—"This letter I sent through Clement the blessed presbyter, a man virtuous and tried, whom ye know and will come to know completely, who being here by the providence and guidance of the Ruler of all strengthened and increased the church of the Lord." A statement of Eusebius in regard to the persecution of Severus in 202 (H.E. vi. 9) would render it likely that Clement left Alexandria on that occasion. It is conjectured that he went to his old pupil Alexander, who was at that time bishop of Flavia in Cappadocia, and that when his pupil was raised to the see of Jerusalem Clement followed him there. The letter implies that he was known to the Antiochians, and that it was likely he would be still better known. Some have conjectured that he returned to Alexandria, but there is not the shadow of evidence for such conjecture. Alexander, writing to Origen (c. 216), mentions Clement as dead (Eus. H.E. vi. 14).

Eusebius and Jerome give us works of the works which Clement left behind him. Photius also has described some of them. They are as follows:—(1) Παραδειγματα λογου και προφητικων, A Homitary Address to the Greeks. (2) Ο Παπαγομυς, The Tutor, in three books. (3) Στροματα, or Patch-work, in eight books. (4) Τε & ουανουσια

The treatise Who is the Rich Man that is Saved? is an admirable exposition of the narrative contained in St Mark's Gospel x. 17-31. Here Clement argues that wealth, if rightly used, is not unchristian. The Hypotyposes, in eight books, have not come down to us. Clement's views were translated into the Greek language of the church, and were adopted by the successors of Clement, and others. 1

The treatise on the Passover was occasioned by a work of Melito on the same subject. Two fragments of this treatise were given by Patauus, and are contained in the modern editions.

We know nothing of the work called The Ecclesiastical Canon from external testimony, but the title is the ιναμαται αεικα, and defines it as the agreement and harmony of the law and the prophets with the covenant delivered at the appearance of Christ (Ström. cap. xvi. 253, p. 803, P.). No doubt the subject is the harmony of the Old Testament with the work of the Church. 2

The other treatises mentioned by Eusebius and Jerome nothing is known. A fragment of Clement, quoted by Antonius Melissus, is probably taken from the works of Jerome and Photius, but Clement's work Ecclesiastical Canons, but this seems to be a mistake.

The treatises mentioned by Eusebius, fragments of treatises on Providence and the Soul have been preserved. Mention is also made of a work of Clement on the Prophet Amos, and another on Daniel.

In addition to these Clement often speaks of his intention to write on certain subjects, but it may well be doubted whether in most cases, if not all, he intended to devote separate treatises to

1 Zahn thinks we have part of them in the Adumbrations Clem. Alex. in epistolis canonicas (Codex Lindum, 96, sec. ix.). They were perhaps intended as a completion of the preceding course.
CLEMENT OF ALEXANDRIA

489

them. Some have found an allusion to the treatise on the Soul already mentioned. The other subjects are Marriage (γαμεῖς λόγος), Contincence, the Duties of Bishops, Presbyters, Deacons and Widows, Prophecy, the Soul, the Transmigration of the Soul and the Devil, Angels, the Origin of the World, First Principles and the Divinity of the Logos, Allegorical Interpretations of Statements made with regard to God’s anger and similar affections, the Unity of the Church, and the Resurrection.

Euripides in its Merit. Prophecy, a Greek quotation, was only将近 the Hebrews. Sometimes, as in the Apocalypse, it was taken by Clement as a mere allusion, and hence its teaching of the unity of the Church, the divinity of the Logos, and the doctrine of the Resurrection, has been incorporated in the editions of Clement which are not mentioned by himself or any ancient writer. They are Εκ τῶν θεοδοτού καὶ τῆς άνατολής καλουμένης διδασκαλία κατά τὸν Ολόκληρον χρόνον ἐπιστολαί, and Εκ τῶν προφητικῶν κελογία. The first, if it is the work of Clement, must be a bon mot, but the second is an excerpt, for it contains many opinions of which Clement disapproved. Mention is made of Pantaenus in the second, and some have thought it more worthy of him than the first. Others have regarded it as a work similar to the first, and derived from Theodorus.

Clement occupies a profoundly interesting position in the history of Christianity. He is the first to bring all the culture of the Greeks and all the speculations of the Christian heretics to bear on the exposition of Christian truth. He does not attain to a systematic exhibition of Christian doctrine, but he paves the way for it, and lays the first stones of the foundation. In some respects Justin anticipated him. He also was well acquainted with Greek philosophy, and took a general view of it; but he was not more a student of Greek philosophy than of Greek literature. The list of Greek authors, to whom Clement has quoted occupies upwards of fourteen of the quarto pages in Fabricius’s Bibliotheca Graeca. He is at home alike in the epic and the lyric, the tragic and the comic poets, and his knowledge of the prose writers is very extensive. Some, however, of the classic poets he appears to have known only from anthologies; hence he was misled into quoting as from Euripides and others verses which were written by Jewish forgers. He made a special study of the philosophers. Equally minute is his knowledge of the systems of the Christian heretics. And in all cases it is plain that he not merely read but thought deeply on the questions which the civilization of the Greeks and the various writings of poets, philosophers and heretics raised. But it was in the Scriptures that he found his greatest delight. He believed them to contain the revelation of God’s wisdom to men. He quotes all the books of the Old Testament except Ruth and the Song of Solomon, and amongst the sacred writings of the Old Testament he evidently included the book of Tobit, the Wisdom of Solomon, and the Book of Enoch. He is equally full in his quotations from the New Testament, for he quotes from all the books except the epistle to Philemon, the second epistle of St Peter, and the epistle of St James, and he quotes from The Shepherd of Hermas, and the epistles of Clemens Romanus and of Barnabas, as inspired. He appeals also to many of the lost gospels, such as those of the Hebrews, of the Egyptians and of Matthias.

Notwithstanding this adequate knowledge of Scripture, the modern theologian is disappointed to find very little of what he deems characteristically Christian. In fact Clement regarded Christianity as a philosophy. The ancient philosophers sought through their philosophy to attain to a nobler and holier life, and this was also the aim of Christianity. The difference between the two, in Clement’s judgment, was that the Greek philosophers had only glimpses of the truth, that they attained only to fragments of the truth, while Christianity revealed in Christ the absolute and perfect truth. All the stages of the evolution of the Christian philosophy were contained in the epistles of Clement. He worked through the same argument; this full revelation of God’s grace was not confined to the Hebrews alone. The worship of the heavenly bodies, for instance, was given to man at an early stage that he might rise from a contemplation of these sublime objects to the worship of the Creator. Greek philosophy in particular was the preparation of the Greeks for Christ. It was the schoolmaster or paedagogue to lead them to Christ. Plato was Moses illuminating. Clement varies in his statement how Plato got his wisdom or his fragments of the Reason. Sometimes he thinks that they came direct from God, like all good things, but he is also fond of maintaining that many of Plato’s best thoughts were borrowed from the Hebrew prophets; and he makes the same statement in regard to the wisdom of the other philosophers. But however this may be, Christ was the end to which all that was true in philosophies pointed. Christ himself was the Logos, the Reason. God the Father was ineffable. The Son alone can manifest Him fully. He is the Reason that prevails the universe, that brings out all goodness, that guides all good men. It was through possessing somewhat of this Reason that the philosophers attained to any truth and goodness; but in Christians he dwells more fully and guides them through all the perplexities of life. Photius, probably on a careless reading of Clement, argued that he could not have believed in a real incarnation. But the words of Clement are quite precise and their meaning indisputable. The real difficulty attaches not to the Second Person, but to the First. The Father in Clement’s mind becomes the Absolute of the philosophers, that is to say, not the Father at all, but the Monad, a mere point devoid of all attributes. He believed in a personal Son of God who was the Reason and Wisdom of God; and he believed that this Son of God really became incarnate though he speaks of him almost invariably as the Word, and attaches little value to his human nature. The object of his incarnation and death was to free man from his sins, to lead him into the path of wisdom, and to raise him to the level of a God. But man’s salvation was to be gradual. It began with faith, passed from that to love, and ended in full and complete knowledge. There could be no faith without knowledge. But the knowledge is imperfect, and the Christian was to do many things in simple obedience without knowing the reason. But he has to move upwards continually until he at length does nothing that is evil, and he knows fully the reason and object of what he does. He thus becomes the true Gnostic, but he can become the true Gnostic only by contemplation and by the practice of what is right. He has to free himself from the power of passion. He has to give up all thoughts of pleasure. He must prefer goodness in the midst of torture to evil with unlimited pleasure. He has to resist the temptations of the body, keeping it under strict control, and with the eye of the soul undimmed by corporeal wants and impulses, contemplate God the supreme good, and live a life according to reason. In other words, he must strive after likeness to God as he reveals himself in his Reason, or, as Clement thus looks entirely at the lightened moral elevation to which Christianity raises man. He believed that Christ instructed men before he came into the world, and he therefore viewed heathenism with kindly eye. He was also favourable to the pursuit of all kinds of knowledge. All enlightenment tended to lead up to the truths of Christianity, and hence knowledge of every kind not evil was its handmaid. Clement had at the same time a strong belief in evolution or development. The world went through various stages in preparation for Christianity. The man goes through various stages before he can reach Christian perfection. And Clement conceived that this development took place not merely in this life, but in the future through successive grades. The Jew and the heathen had the gospel preached to them in the world below by Christ and his apostles, and Christians will have to pass through processes of purification and trial after death before they reach knowledge and perfect bliss.

The beliefs of Clement have caused considerable difference of opinion among modern scholars. He sought the truth from the scripture and believed that he could get it, believing that all that is good comes from God, wherever it be found. He belongs therefore to no school of philosophers. He calls himself an Eclectic. He was in the main a Neoplatonist, drawing from that school his doctrines of the Monad and his strong tendency towards mysticism. For his moral doctrine he borrowed freely from Stoicism. Aristotelian features may be found but are quite subordinate. But Clement always regards the articles of the Christian creed as the axioms of a new philosophy. Daehne had tried to show that he was Neoplatonic, and Reinkeins has maintained that he was essentially Aristotelian. His mode of viewing Christianity does not fit into any classification. It is the result of the period in which he lived, of his wide culture and the simplicity and noble purity of his character.

It is needless to say that his books well deserve study: but
the study is not smoothed by simplicity of style. Clement professed to despise rhetoric, but was himself a rhetorician, and his style is rugged, involved and difficult. It is singularly simple in his character; his discussion marriage he hesitates to use any but the plainest language. A euphemism is with him a falsehood. But he is temperate in his opinions; and the practical advice in the second and third books of the Paedagogae are remarkably sound and moderate. He is not always very critical, and he is passionately fond of allegorical interpretations, but these are the faults of his age.

All early writers speak of Clement in the highest terms of laudation, and he certainly ought to have been a saint in any Church that reveres saints. But Clement is not a saint in the Roman Church. He was a saint up till the time of Benedict XIV., who read Photius on Clement, believed him, and struck the Alexandrian's name out of the calendar. But many Roman Catholic writers, though they yield a practical obedience to the papal decision, have adduced good reason why it should be reversed (Cognat, p. 451).

Editions.—The standard edition of the collected works will be that of 1770 (Stehlin, 1st vol. containing Protopetaxes and Paedagogae, Leipzig, 1905). Separate editions of Strom. vii., Hort and Major (1929); Q.D.S. Barnard in Texts and Studies, v. 2 (1897); W. Dindorf's edition in 4 vols. (Oxford, 1869) is little more than a reprint of the Bishop's English translation (1794) with the addition of a critical apparatus; Zahn, Gesch. des neut. Kanons, part iii., or Harbach and Preuschen, Gesch. der altl. Litt., vol. i.

Literature.—A copious bibliography will be found in Harbach. Châtelain, Histoire de l'Edit de l'Ordre des Jeunes Philosophes (1898). The following will supply the names of works upon Clement's biblical text, his use of Stoic writers, his quotations from heathen authors, and his relation to heathen philosophy. A valuable book is de Faye, Clem. d'Alex. (1808). For his theological position see Harbach, Dogmata geschichte; Hort, Six Lectures on the Ante-Nicene Fathers; Westcott, "Clem. of Alex." in Diet. Christ. Biot.; Biggs, Christian Platonists of Alex. (1886). A book on Clement's relation to Mysticism is welcome. (C. Br.; J. D.)

CLÉMENT, FRANÇOIS (1774-1793), French historian, was born at Béze, near Dijon, and was educated at the Jesuit College at Dijon. At the age of seventeen he entered the Society of the Benedictines of Saint Maur, and worked with such intense application that at the age of twenty-five he was obliged to take a protracted rest. He now resided in Paris, where he wrote the 11th and 12th vols. of the Histoire littéraire de la France, and edited (with Dom Briot) the 11th and 12th vols. of the Recueil des historiens des Gaules et de la France. The king appointed him on the committee which was engaged in publishing charters, diplomas and other documents connected with French history (see Xavier Charmes, Le Comité des travaux historiques et scientifiques, vol. i., 1886, passim); and the Academy of Inscriptions chose him as a member (1785). Dom Clément also revised the Art de rédiger les dates, edited in 1750 by Dom Clémencet. Three volumes with the Indexes appeared from 1783 to 1792. He was engaged in preparing another volume including the period before the Christian era, when he died suddenly of apoplexy, at the age of sixty-nine. The work was afterwards brought down to 1796 by the Abbe de Courcelles and Fortia d'Urban, with the volumes from 1783 to 1792.

CLÉMENT, JACQUES (1567-1586), murderer of the French king Henry III., was born at Sorbon in the Ardennes, and became a Dominican friar. Civil war was raging in France, and Clément became an ardent partisan of the League; his mind appears to have become unhinged by religious fanaticism, and he talked of exterminating the heretics, and formed a plan to kill Henry III. His project was encouraged by some of the heads of the League; he was assured of temporal rewards if he succeeded, and of eternal bliss if he failed. Having obtained letters for the king, he left Paris on the 31st of July 1589, and reached St Cloud, the headquarters of Henry, who was besieging Paris. On the following day he was admitted to the royal presence, and presenting his letters he told the king that he had an important and confidential message to deliver. The attendants then withdrew, and while Henry was reading the letters Clément mortally wounded him with a dagger which had been concealed beneath his cloak. The assassin was at once killed by the attendants who rushed in, and Henry died early on the following day. Clément's body was afterwards quartered and burned. This deed, however, was viewed with far different feelings in Paris and by the partisans of the League, the murderer being regarded as a martyr and exalted by Pope Sixtus V., while even his canonization was discussed.

CLÉMENTI, MUIZIO (c. 1751-1832), Italian pianist and composer, was born at Rome between 1750 and 1752. His father, a jeweller, encouraged his son's early musical talent. Burioni and Cordicelli were his first masters, and at the age of nine Clementi's theoretical and practical studies had advanced to such a degree that he was able to win the position of organist at a church. He continued his studies under Santarelli and Carpani, and at the age of fourteen wrote a mass which was performed in public. About 1766 Beckford, the author of Vala, persuaded Clementi to follow him to England, where the young composer lived in retirement at one of the country seats of his protector in Dorsetshire until 1770. In that year he first appeared in London, where his success both as composer and pianist was rapid and brilliant. In 1777 he was for some time employed as conductor of the Italian opera, but he soon afterwards left London for Paris. Here also his concerts were not crowded by enthusiastic audiences, and the same success accompanied Clementi on a tour about the year 1780 to southern Germany and Austria. At Vienna, which he visited between 1781 and 1782, he was received with high honour by the emperor Joseph II., in whose presence he met Mozart, and fought a kind of musical duel with him. His technical skill proved to be equal if not superior to that of his rival, who on the other hand infinitely surpassed him by the passionate beauty of his interpretation. It is worth noting that one of the finest of Clementi's sonatas, that in B flat, shows an exactly identical opening theme with Mozart's overture to the Fandango. In May 1782 Clementi returned to London, where for the next twelve years he continued his lucrative occupations of fashionable teacher and performer at the concerts of the aristocracy. He took shares in the pianoforte business of a firm which went bankrupt in 1800. He partly established pianoforte and music business of his own, under the name of Clementi & Co. Other members were added to the firm, including Collard and Davis, and the firm was ultimately taken over by Messrs Collard alone. Amongst his pupils on the pianoforte during this period may be mentioned John Field, the composer of the celebrated Nocturnes. In his company Clementi paid, in 1804, a visit to Paris, Vienna, St Petersburg, Berlin and other cities. While he was in Berlin, Meyerbeer became one of his pupils. He also revisited his own country after an absence of more than thirty years. In 1810 Clementi returned to London, but refused to play again in public, devoting the remainder of his life to composition. Several symphonies belong to this time, and were played with much success at contemporary concerts, but none of them seem to have been published. His intellectual and musical faculties remained unimpaired until his death, on the 9th of March 1832, at Evesham, Worcestershire.

Of Clementi's pianoforte music, Haydn writes that it was "marked by a most beautiful legato, a supple touch in lively passages, and a most unfailing technique." Mozart may be said to have closed the old and Clementi to have founded the newer school of technique on the piano. Amongst Clementi's compositions the most remarkable are sixty sonatas for pianoforte, and the great collection of Études called Gradus ad Parnassum.

Clementine literature, the name generally given to the writings which at one time or another were fathered upon Pope Clement I. (c.v.), commonly called Clemens Romanus, who was early regarded as a disciple of St Peter. Thus they are for the most part a species of the larger pseudo-Petrine genus. Chief among them are: (1) the so-called Second Epistle: (2) two Epistles on Virginity; (3) the Hymnics and Recognitions; (4) the Apostolic Constitutions (c.v.); and (5) five epistles forming part of the Forged Decretals (see Decretals). The present article deals mainly with the third group, to which the title "Clementine literature" is usually confined, owing to the stress
CLEMENTINE LITERATURE

I

laid upon it in the famous Tübingen reconstruction of primitive Christianity, in which it played a leading part; but later criticism has lowered its importance as its true date and historical relations have been progressively ascertained. (1) and (2) became "Clementine" only by chance, but (3) was so originally by literary device or fiction, the cause at work also in (4) and (5). But while all in the cases of Clement's authorship came ultimately from his prestige as writer of the genuine Epistle of Clement (see CLEM. I.), both (3) and (4) were due to this idea as operative on Syrian soil; (5) is a secondary formation based on (3) as known to the West.

(1) The "Second Epistle of Clement."—This is really the earliest extant Christian homily (see Apostolic Fathers). Its theme is the duty of Christian repentance, with a view to obedience to Christ's precepts as the true confession and homage which He requires. Its special charge is "Preserve the flesh pure and the seal (i.e. baptism) unimpaired" (viii. 6). But the peculiar way in which it enforces its morals in terms of the Platonic contrast between the spiritual and sensuous worlds, as archetype and temporal manifestation, suggests a special local type of theology which must be taken into account in fixing its provenance. This theology, the fact that the preacher seems to quote the Gospel according to the Egyptians (in ch. xii. and possibly elsewhere) as if familiar to his hearers, and indeed its literary affinities generally, all point to Alexandria as the original home of the homily, at a date about 120-140 (see Zeit. f. N.T. Wissenschaft, vi. 123 ff.). Neither Corinth (as Lightfoot) nor Rome (as Harnack, who assigns it to Bishop Soter, c. 166-174) satisfies all the internal conditions, while the Eastern nature of the external evidence and the homily's quasi-canonical status in the Codex Alexandrinus strongly favour an Alexandrine origin.

(2) The Two Epistles to Virgins, i.e. to Christian celibates of both sexes. These are known in their entirety only in Syriac, and were first published by Westermarck (1752), who held them genuine. This view is now generally discredited, even by Roman Catholics. The best known Epistle for its antiquity (Peter Apol., vol. ii.). External evidence begins with Ephippius (Haer, xxv. 15) and Jerome (Ad Join. i. 12); and the silence of Eusebius tells heavily against the existence before the 4th century, at any rate as writings of Clement. The Monophysite Timothy of Alexandria (A.D. 457) cites one of them as Clement's, while Antiochus of St. Saba (c. A.D. 630) makes copious but unacknowledged extracts from both in the original Greek. There is no trace of their use in the West. Thus their Syriac origin is manifest, the more so that in the Syriac MS. they are appended to the New Testament, like the better-known epistles of Clement in the Codex Alexandrinus. Indeed, judging from another Syriac MS. of earlier date, which includes the latter writings in its canon, it seems that the Epistles on Virginity gradually replaced the earlier pair in certain Syrian churches—even should Lightfoot be right in doubting if this had really occurred by Ephippius's day (S. Clement of Rome, i. 416). Probably the Epistles did not originally bear Clement's name at all, but formed a single epistle addressed to ascetics among an actual circle of churches. In that case they, or rather it, may date from the 3rd century in spite of Eusebius's silence, and are not pseudo-Clementine in any real sense. It matters little whether or not the false ascription was made before the division into two implied already by Ephippius (c. A.D. 375). Special occasion for such a hortatory letter may be discerned in its polemic against intimate relations between ascetics of opposite sex, implied to exist among its readers, in contrast to usage in the writer's own locality. Now we know that spiritual unions, prompted originally by high-strung Christian idealism as to a religious fellowship transcending the law of nature in relation to sex, did exist between persons living under vows of celibacy during the 3rd century in particular, and not least in Syria (cf. the case of Paul of Samosata, c. 265; and the Syriac liturgy of the Church in Syria, c. 314). It is natural, then, to see in the original epistle a protest against the dangers of such spiritual boldness (cf. "Subintroductae" in Herzog-Hauck's Realencyclopaedia), prior perhaps to the famous case at Antioch just noted.

Possibly it is the feeling of south Syria or Palestine that here expresses itself in remonstrance against usages prevalent in north Syria. Such a view finds support also in the New Testament canon implied in these epistles.

(3) a] The Epistle of Clement to James (the Lord's brother). This was originally part of (3) b], in connexion with which its origin and date are discussed. But as known to the West through Ruinanus's Latin version, it was quoted as genuine by the synod of Vaison (A.D. 442) and throughout the middle ages. It became "the starting point of the most momentous and gigantic of medieval forgeries, the Isidorian Declaratums," where it stands at the head of the pontifical letters, extended to more than twice its original length. This extension perhaps occurred during the 5th century. At any rate the letter in this form, along with a "second epistle to James" (on the Eucharist, church furniture, &c.), dating from the early 6th century, had separate currency long before the 9th century, when they were incorporated in the Declaratums by the forger who raised the Clementine epistles to five (a. Lightfoot, Clement. i. 414 ff.).

(3) b] The "Homilies" and "Recognitions."—The two chief extant Clementine writings, differing considerably in some respects in doctrine, are both evidently the outcome of a peculiar speculative type of Judaistic Christianity, for which the most characteristic name of Christ was "the true Prophet." The framework of both is a narrative purporting to be written by Clement (of Rome) to St James, the Lord's brother, describing at the beginning his own conversion and the circumstances of his first acquaintance with St Peter, and then a long succession of incidents accompanying St Peter's discourses and disputations, leading up to a romantic recognition of Clement's father, mother and two brothers, from whom he had been separated since childhood. The problems discussed under this fictitious guise are with rare exceptions fundamental problems for every age; and, whatever may be thought of the positions maintained, the discussions are hardly ever feeble or trivial. Regarded simply as mirroring the past, few, if any, remains of Christian antiquity present us with so vivid a picture of the working of men's minds under the influence of the new leaven which had entered into the world (Hort, Clem. Recog., p. xiv.).

The indispensable preliminary to a really historic view of these writings is some solution of the problem of their mutual relations. The older criticism assumed a dependence of one upon the other, and assigned one or both to the latter part of the 2nd century. Recent criticism, however, builds on the principle, which emerges alike from the external and internal evidence (see Salmon in the Dict. of Christian Biography), that both used a common basis. Our main task, then, is to define the nature, origin and date of the parent document, and if possible its own literary antecedents. Towards the solution of this problem two contributions of prime importance have recently been made. The earlier of these is by F. J. A. Hort, and was delivered in the form of lectures as far back as 1864, though issued posthumously only in 1907; the other is the elaborate monograph of Dr Hans Waetz (1904).

Criticism.—(i.) External Evidence as to the Clementine Romance. The evidence of ancient writers really begins, not with Origen, but with Eusebius of Caesarea, who in his Eccl. Hist. iii. 38, writes as follows: "Certain men have quite lately brought forward as written by him (Clement) other verbose and lengthy writings, containing dialogues of Peter, forsooth, and Apion, whereof not the slightest mention is to be found among the ancients, for they do not even preserve in purity the stamp of the Apostolic orthodoxy." Apion, the Alexandrine grammarians
and foe of Judaism, whose criticism was answered by Josephus, appears in this character both in Homilies and Recognitions, though mainly in the former (iv. 6–vii. 5). Thus Eusebius implies (1) a spurious Clementine work containing matter found also in our Homilies at any rate; and (2) its quite recent origin. Next we note that an extract in the Philochoia is introduced as follows: “Yea, and Clement the Roman, a disciple of Peter the Apostle, after using words in harmony with these on the present problem, in conversation with his father at Laodicea in the Circuits, speaks a very necessary word for the end of arguments touching this matter, viz. those things which seem to have proceeded from genesis (= astrological destiny), in the fourteenth book.” The extract answers to Recognitions, x. 10–13, but it is absent from our Homilies. Here we observe that (1) the extract agrees this time with Recognitions, not with Homilies; (2) its framework is that of the Clementine romance found in both; (3) the tenth and last book of Recognitions is here parallel to book xiv. of a work called Circuits (Periodoi).

This last point leads on naturally to the witness of Epiphanius (c. 375), who, speaking of Ebionites or Judaizing Christians of various sorts, and particularly the Essene type, says (Haer. xxx. 15) that “they used, certainly, to be called the so-called Circuits of Peter, which were written by the hand of Peter, falsifying their contents, though leaving a few genuine things.” Here Epiphanius simply assumes that the Ebionite Circuits of Peter was based on a genuine work of the same scope, and goes on to say that the spurious elements are proved such by contrast with the tenor of Clement’s “encyclic epistles” (i.e. those to virgin, (2) above) for these enjoin virginity (celibacy), and praise Elijah, David, Samson, and all the prophets, whereas the Ebionite Circuits favour marriage (even in Apostles) and deprecate the prophets between Moses and Christ, “the true Prophet.” “In the Circuits, then, they adapted the whole to their own views, representing Peter falsely in many ways, as that he was daily baptized for the sake of purification, as these also do; and they say that he likewise abstained from animal food and meat, as they themselves also do.” Now all the points here noted in the Circuits can be traced in our Homilies and Recognitions, though toned down in different degrees.

The witness of the Arianizing Opus Imperfectum in Maththaeum (c. 380) is in general similar. Its usual form of citation is “Peter in Clement” (apud Clementem). This points to “Clement” as a brief title for the Clementine Periodoi, a title actually found in a Syriac MS. of A.D. 411 which contains large parts of Recognitions and Homilies, and twice used by Rufinus, e.g. when he proposes to inscribe his version of the Recognitions “Rufinus Clement.” Rufinus in his preface to this work—in which for the first time we meet the title Recognition(s)—observes that there are two editions to which the name applies, two collections of books differing in some points but in many respects containing the same narrative. This he remarks in explanation of the order of his version in some places, which he feels may strike his friend Gaudentius as unusual, the inference being that the other edition was the better-known one, although it lacked “the transformation of Simon” (i.e. of Clement's father into Simon’s likeness), which is common to the close both of our Recognitions and Homilies, and so probably belonged to the Circuits. We may assume, too (e.g. on the basis of our Syriac MS. that the Greek edition of the Recognition(s) actually used by Rufinus was much nearer the text of the Periodoi of which we have found traces than we should imagine from its Latin form.

So far we have no sure trace of our Homilies at all, apart from the Syriac version. Even four centuries later, Photius, in referring to a collection of books called both Acts of Peter and the Recognition of Clement, does not make clear whether he means Homilies or Recognitions or either. “In all the copies which we have seen (and they are not a few) after those different epistles (viz. Peter to James and Clement to James, prefixed, the one in some MSS. the other in others) and titles, we found without variation the same treatise, beginning, I, Clement, &c.” But it is not clear that he had read more than the opening of these MSS. The fact that different epistles are prefixed to the same work leads him to conjecture “that there were two editions made of the Acts of Peter (his usual title for the collection), but in course of time the one perished and that of Clement prevailed.”

This is interesting as anticipating a result of modern criticism, as will appear below. The earliest probable reference to our Homilies occurs in a work of doubtful date, the pseudo-Athanasian Synopsis, which mentions “Clementines, whence came by selection and rewriting the true and inspired form.” Here we have the first sure trace of an expurgated recension, made with the idea of recovering the genuine form assumed, as earlier by Epiphanius, to lie behind an unorthodox recension of Clement's narrative. As, moreover, the extant Epitome is based on our Homilies, it is natural to suppose it was also the basis of earlier orthodox recensions, one or more of which may be used in certain Florilegia of the 7th century and later. Nowhere do we find the title Homilies given to any form of the Clementine collection in antiquity.

(ii). The Genesis of the Clementine Literature. It has been needful to cite so much of the evidence proving that our Homilies and Recognitions are two recensions of a common basis, at first known as the Circuits of Peter and later by titles connecting it rather with Clement, its ostensible author, because it affords data also for the historical problems touching (a) the contents and origin of the primary Clementine work, and (b) the conditions under which our extant recensions of it arose.

(a) The Circuits of Peter, as defined on the one hand by the epistle of Clement to James originally prefixed to it and by patristic evidence, and on the other by the common element in our Homilies and Recognitions, may be conceived as follows. It contained accounts of Peter's teachings and discussions at various points on a route beginning at Caesarea, and extending northwards along the coast-lands of Syria as far as Antioch. During this tour he meets with persons of typically erroneous views, which it was presumably the aim of the work to refute in the interests of true Christianity, conceived as the final form of divine revelation—a revelation given through true prophecy embodied in a succession of persons, the chief of whom were Moses and the prophet whom Moses foretold, Jesus the Christ. The prime exponent of the spurious religion is Simon Magus. A second protagonist of error, this time of Gentile philosophic criticism directed against fundamental Judaism, is Apion, the notorious anti-Jewish Alexiadene grammaticus of Peter's day; while the rôle of upholder of astrological fatalism (Genesis) is played by Faustus, father of Clement, with whom Peter and Clement debate at Laodicea. Finally, all this is already embedded in a setting determined by the romance of Clement and his lost relatives, “recognition” of whom forms the dénouement of the story.

There is no reason to doubt that such, roughly speaking, were the contents of the Clementine work to which Eusebius alludes slightly, in connexion with that section of it which had to his eye least verisimilitude, viz. the dialogues between Peter and Apion. Now Eusebius believed the work to have been quite recent and suspicious origin. This points to a date about the last quarter of the 3rd century; and the prevailing doctrinal tone of the contents, as known to us, leads to the same result. The standpoint is that of the peculiar Judaizing or Ebionite type which was implicitly held by most of the more orthodox among pre-Christian Jews asEssene. The Essene, while clinging to what they held to be original Mosaic law, yet conceived and practised their ancestral faith in ways which showed distinct traces of syncretism, or the operation of influences foreign to Judaism proper. They thus occupied an ambiguous position on the borders of Judaism. Similarly Christian Essen-}
If the home of the Periodoi was the region of the Syrian Laodicea, we can readily explain most of its characteristics. Photius refers to the "excellences of its language and its learning"; but Waitz describes the aim and spirit of its contents as those of an apology for Christianity against heresy and paganism, in the widest sense of the word, written in order to win over both Jews (cf. Recognitions, i. 53-70) and pagans, but mainly the latter. In particular it had in view persons of culture, as most apt to be swayed by the philosophical tendencies in the sphere of religion prevalent in that age, the age of neo-Platonism. It was in fact designed for propaganda among religious seekers in a time of singular religious restlessness and varied inquiry, and, above all, for use by catechumens (cf. Ep. Clem. 2, 13) in the earlier stages of their preparation for Christian baptism. To such its romantic setting would be specially adapted, as falling in with the literary habits and tastes of the period; while its doctrinal peculiarities would least give offence in a work of the aim and character just described.

As regards the sources, the narrative part of the Periodoi, it is possible that the "recognition" motif was a literary commonplace. The account of Peter's journeys was no doubt largely based on the local legend, perhaps already embodied in Eusebius's Writings of Peter. A period of such a date is afforded by the silence of the Syrian Didascalia, itself perhaps dating from about 250, as to any visit of Simon Magus to Caesarea, in contrast to the reference in its later form, the Apostolic Constitutions (c. 350-420), which is plainly coloured (vi. 9) by the Clementine story. On the other hand, the Didascalia seems to have been evoked partly by Judaizing propaganda in north Syria. If, then, it helps to date the Periodoi as after 250, it may also suggest as place of origin one of the large cities lying south of Antioch, say Laodicea (itself on the coast about 30 m. from Apamea), where the Clementine story reaches its climax. The intimacy of local knowledge touching this region implied in the narrative common to Homilies and Recognitions is notable, and tells against an origin for the Periodoi outside Syria (e.g. in Rome, as Waitz and Harnack hold, but Lightfoot disproves, Clem. i. 55 f., 64,100, cf. Hort, p. 131). Further, though the curtain even in it fell on Peter at Antioch itself (our one complete MS. of the Homilies is proved by the Epitome, based on the text of St. John, to be here abridged), the interest of the story culminates at Laodicea.

If we assume, then, that the common source of our extant Clementines arose in Syria, perhaps c. 265, had it also a written source or sources which we can trace? Though Hort doubts it, most recent scholars (e.g. Waitz, Harnack) infer the existence of at least one source, "Preachings (Keryg mata) of Peter," containing no reference at all to Clement. Such a work seems implied by the epistle of Peter to James and its appended adjuration, prefixed in our MSS. to the Homilies along with the epistle of Clement to James. Thus the later work aimed at superseding the earlier, much as Photius suggests (see above).

It was, then, to these "Preachings of Peter" that the most Ebionite features, and especially the anti-Pauline allusions under the guise of Simon still inhering in the Periodoi (as implied by Homilies in particular), originally belonged. The fact, however, that these were not merely completely suppressed in the later work, proves that it, too, arose in circles of kindred, though largely modified, Judaio-Christian sentiment (cf. Homilies, vii., e.g. ch. 8). The differences of standpoint may be due not only to lapse of time, and the emergence of new problems on the horizon of Syrian Christianity generally, but also to change in locality and in the degree of Greek culture represented by the two works. A probable date for the "Preachings" used in the Periodoi is c. 200.

1 While Hort and Waitz say c. 200, Harnack says c. 260. The reign of Gallienus (260-268) would suit the tone of its references to the Roman emperor (Waitz, p. 74), and also any polemic against the Neoplatonic philosophy of revelation by visions and dreams which it may contain.

2 Even Waitz agrees to this, though he argues back to a yet earlier anti-Pauline (rather than anti-Marcionite) form, composed in Caesarea, c. 135.
commending the Christian religion over against all non-Christian rivals or gnostic perversions. That is, more than one effort of this sort had been made to adapt the story of Clement’s Recognitions to general Christian use. Later the Homilies underwent full adaptation to Catholic feeling even before the Epitome, in its two extant forms, was made by more drastic methods of expurgation. One kind of adaptation at least is proved to have existed before the end of the 4th century, namely a selection of certain discourses from the Homilies under special headings, following on Recognitions, i–iii, as seen in a Syriac MS. of A.D. 411. As this MS. contains transcriptional errors, and as its archetype had perhaps a Greek basis, the Recognitions may be dated c. 350–375. (Its Christology suggested to Rufinus an Ariasian like that of Eunomius of Cyzicus, c. 362), and the Homilies prior even to 350. But the different circles represented by the two make relative dating precarious.

Summary.—The Clementine literature throws light upon a very obscure phase of Christian development, that of Judaeo-Christianity, and proves that it embraced more intermediate types, between Ebionism proper and Catholicism, than has generally been realized. Incidentally, it points to the circumstances in matters of belief and usage among Syrian Christians generally in the 3rd and 4th centuries, notably their apologetic and catechetical needs and methods. Further, it discloses, as Holt observes, certain incontestable problems which much early Christian theology passes by or deals with rather perfunctorily; and it does so with a freshness and reality which, as we compare the original 3rd-century basis with the conventional manner of the Epitome, we see to be not unconnected with origin in an age yet free from the trammels of formal orthodoxy. Again it is a notable specimen of early Christian pseudography, and one which had manifold and far-reaching results. Finally the romance to which it owed much of its popular appeal, became, through the medium of Rufinus’s Latin, the parent of the late medieval legend of Faust, and so the ancestor of a famous type in modern literature.

Cleobulus, one of the Seven Sages of Greece, a native and tyrant of Lindus in Rhodes. He was distinguished for his strength and his handsome person, for the wisdom of his sayings, the acuteness of his riddles and the beauty of his lyric poetry. Diogenes Laërtius quotes a letter in which Cleobulus invites Solon to take refuge with him against Pelasstratus; and this might imply that he was alive in 360 B.C. He is said to have held advanced views as to female education, and he was the father of the wise Cleobuline, whose riddles were not less famous than his own (Diogenes Laërtius i. 89–93).

See F. G. Mullach, Fragmenta Philosphorum Graecorum, i.

Cleomenes (Kleomenes), the name of three Spartan kings of the Agiad line.

Cleomenes I. was the son of Anaxandridas, whom he succeeded about 520 B.C. His chief exploit was his crushing victory near Tyrins over the Argives, some 6000 of whom he burned to death in a sacred grove to which they had fled for refuge (Herodotus vi. 76–82). This secured for Sparta, the undisputed hegemony of the Peloponnese, and led Athens into the politics of central Greece was less successful. In 510 he marched to Athens with a Spartan force to aid in expelling the Peloponnesians, and subsequently returned to support the oligarchical party, led by Isagoras, against Cleisthenes (q.v.). He expelled seven hundred families and transferred the government from the council to three hundred of the oligarchs, but being blockaded in the Acropolis he was forced to capitulate. On his return home he collected a large force with the intention of making Isagoras despot of Athens, but the opposition of the Corinthian allies and of his colleague Demaratus caused the expedition to break up after reaching Eleusis (Herod. v. 63–75; Aristotle, Ath. Pol. 19, 20). In 491 he went to Aegina to punish the island for its submission to Darius, but the intrigues of his colleague once again rendered his mission abortive. In revenge Cleomenes accused Demaratus of illegitimacy and secured his deposition in favour of Leotychides (Herod. vi. 50–73). But when it was discovered that he had bribed the Delphian priests to substantiate his charge he was himself obliged to flee; he went first to Thessaly and then to Arcadia, where he attempted to foment an anti-Spartan rising. About 488 B.C. he was recalled, but shortly afterwards, in a fit of madness, he committed suicide (Herod. vii. 74, 75). Cleomenes seems to have received scant justice at the hands of Herodotus or his informants, and Pausanias (iii. 3, 4) does little more than condense Herodotus’s narrative.

In spite of some failures, largely due to Demaratus’s jealousy, Cleomenes strengthened Sparta in the position, won during his father’s reign, of champion and leader of the Hellenic race; it was to him, for example, that the Ionian cities of Asia Minor first applied for aid in their revolt against Persia (Herod. vi. 45–51).

For the chronology see J. Wells, Journal of Hellenic Studies (1905), p. 193 ff., who assigns the Argive expedition to the outset of the reign, whereas nearly all historians have dated it in or about 495 B.C.

Cleomenes II. was the son of Cleombrotus I., brother and successor of Agesipolis II. Nothing is recorded of his reign save the fact that it lasted for nearly sixty-one years (370–309 B.C.).

Cleomenes III., the son and successor of Leonidas II., reigned about 235–210 B.C. He made a determined attempt to reform the social condition of Sparta along the lines laid down by Agis IV., whose widow Agiatis he married; at the same time he aimed at restoring Sparta’s hegemony in the Peloponnese. After twice defeating the forces of the Achaean League in Arcadia, near Mount Lycaem and at Leuctra, he strengthened his position by assassinating four of the ephors, abolishing the ephebate, which had usurped the supreme power, and banishing some eighty of the leading oligarchs. The authority of the council was also curtailed, and a new board of magistrates, the patronomies, became the chief officers of state. He appointed his own brother Eucleidas as his colleague in succession to the Euryptiad Archidamus, who had been murdered. His social reforms included a redistribution of land, the remission of debts, the restoration of the old system of training (klyogy) and the amission of picked periocoi into the citizen body. As a general Cleomenes did much to revive Sparta’s old prestige. He defeated the Achaeans at Dyme, made himself master of Argos, and was eventually joined by Corinth, Phlius, Epidaurus and other cities. But Aratus, whose jealousy could not brook to see a Spartan at the head of the Achaean league called in Antigonus Doson of Macedonia, and Cleomenes, after conducting successful expeditions to Megalopolis and Argos, was finally defeated at Selasia, to the north of Sparta, in 222 or 221 B.C. He took refuge at Alexandria with Ptolemy Euergetes, but was arrested by his successor, Ptolemy Philopator, on a charge of conspiracy. Escaping from prison he tried to raise a revolt, but the attempt failed and in avoiding capture he put an end to his life. He was buried and as politician Cleomenes was one of Sparta’s greatest men, and with him perished her last hope of recovering her ancient supremacy in Greece.

See Polybius ii. 45–70, v. 35–39, viii. 1; Plutarch, Cleomenes; Aratus, 35–46; Philopoemen, 5, 6; Pausanias ii. 9; Gehert, De Cleomenes (Leipzig, 1883); Holm, History of Greece, iv. cc. 10, 15. (M. N. T.)

Cleon (d. 422 B.C.), Athenian politician during the Peloponnesian War, was the son of Cleaenetus, from whom he inherited a lucrative tavernry business. He was the first prominent representative of the commercial class in Athenian politics. He came into notice first as an opponent of Pericles, to whom his advanced ideas were naturally unacceptable, and in his opposition somewhat curiously found himself acting in concert with the aristocrats, who equally hated and feared Pericles. During the dark days of 430, after the unsuccessful expedition of Pericles to
Peloponnesus, and when the city was devastated by the plague, Cleon headed the opposition to the Periclean régime. Pericles was accused by Cleon of maladministration of public money, with the result that he was actually found guilty (see Grote's *Hist. of Greece*, abridged ed., 1897, p. 426, note i). A reversion of feeling, however, soon took place. Pericles was reinstated, and Cleon now for a time fell into the background. The death of Pericles (429) left the field clear for him. Hitherto he had only been a vigorous opposition speaker, a trenchant critic and accuser of state officials. He now came forward as the professed champion and leader of the democracy, and, owing to the moderate abilities of his rivals and opponents, he was for some years undoubtedly the foremost man in Athens. Although rough and unpolished, he was gifted with natural eloquence and a powerful voice, and knew exactly how to work upon the feelings of the people. He strengthened his hold on the poorer classes by his measure for trebling the pay of the jurymen, which provided the poorer Athenians with an easy means of livelihood. The notorious fondness of the Athenians for litigation increased his power; and the practice of "sycophancy" (raking up material for false charges; see SYCOPHANT), enabled him to remove those who were likely to endanger his ascendancy. Having no further use for his former Aristeides, he had the means to drive off his friends, and thus felt at liberty to attack the secret combinations for political purposes, the oligarchical clubs to which they mostly belonged. Whether he also introduced a property-tax for military purposes, and even held a high position in connexion with the treasury, is uncertain. His ruling principles were an inveterate hatred of the nobility, and an equal hatred of Sparta. It was mainly through him that the opportunity of concluding an honourable peace (in 425) was lost, and in his determination to see Sparta humbled he misled the people as to the extent of the resources of the state, and dazzled them by promises of future benefits.

In 427 Cleon gained an evil notoriety by his proposal to put to death indiscriminately all the inhabitants of Mytilene, which had put itself at the head of a revolt. His proposal, though accepted, was, fortunately for the credit of Athens, rescinded, although, as it was, the chief leaders and prominent men, numbering about 1000, fell victims. In 425, he reached the summit of his fame by capturing and transporting to Athens the Spartans who had been blockaded in Sparta (see PYLAEI). He was probably due to the military skill of his colleague Demosthenes, but it must be admitted that it was due to Cleon's determination that the Ecclesia sent out the additional force which was needed. It was almost certainly due to Cleon that the tribute of the "allies" was doubled in 425 (see DELIAN LEAGUE). In 422 he was sent to recapture Amphipolis, but was outgeneralled by Brasidas and killed. His death removed the chief obstacle to an arrangement with Sparta, and in 421 the peace of Nicias was concluded (see PELOPONNESIAN WAR).

The character of Cleon is represented by Aristophanes and Thucydidcs in an extremely unfavourable light. But neither can be considered an unprejudiced witness. The poet had a grudge against Cleon, who had accused him before the senate of having ridiculed (in his Babylonians) the policy and institutions of his country in the presence of foreigners and at the time of a great national war. Thucydidcs, a man of strong oligarchical prejudices, had also been prosecuted for military incapacity and exiled by a decree proposed by Cleon. It is therefore likely that Cleon had done to him in the portraits handed down by these two writers.

CLEOPATRA, the regular name of the queens of Egypt in the Ptolemaic dynasty after Cleopatra, daughter of the Seleucid Antiochus the Great, wife of Ptolemy V, Epiphanes. The best known was the daughter of Ptolemy XIII. Auletes, born 69 or 68 B.C. At the age of seventeen she became queen of Egypt jointly with her younger brother Ptolemy Dionysus, whose wife, in accordance with Egyptian custom, she was to become. A few years afterwards, deprived of all royal authority, she withdrew into Syria, and in preparation to recover her rights by force of arms. At this juncture Judas Caesar followed Pompey into Egypt. The personal fascinations of Cleopatra induced him to undertake a war on her behalf, in which Ptolemy lost his life, and she was replaced on the throne in conjunction with a younger brother, of whom, however, she soon rid herself by poison. In Rome she lived openly with Caesar as his mistress until his assassination, when, aware of her unpopularity, she returned at once to Egypt. Subsequently she became the ally and mistress of Mark Antony (see ANTONIUS). Their connexion was highly unpopular at Rome, and Octavian (see AUGUSTUS) declared war upon them and defeated them at Actium (31 B.C.). Cleopatra took to flight, and escaped to Alexandria, where Antony joined her. Having no prospect of ultimate success, she accepted the proposal of Octavian that she should assassinate Antony, and enticed him to join her in a mausoleum which she had built in order that "they might die together." Antony committed suicide, in the mistaken belief that she had already done so, but Octavian refused to yield to the charms of Cleopatra who put an end to her life, by applying an asp to her bosom, according to the common tradition of our thirty-ninth year of her age (49th of August 30, B.C.). With her ended the dynasty of the Ptolemies, and Egypt was made a Roman province. Cleopatra had three children by Antony, and by Julius Caesar, as some say, a son, called Caesarion, who was put to death by Octavian. In her the type of queen characteristic of the Macedonian dynasties stands in the most brilliant light. Imperious will, masculine boldness, relentless ambition like hers had been exhibited by queens of her race since the old Macedonian days before Philip and Alexander. But the last Cleopatra had perhaps some special intellectual endowment. She surprised her generation by being able to speak the many tongues of her subjects. There may have been an individual quality in her luxurious profligacy, but then her predecessors had not had the Roman lords of the world for woorers.

For the history of Cleopatra see ANTONIUS, MARCUS; CAESAR, GAUiUS JULIUS; PTOLEMIES. The life of Antony by Plutarch is our main authority; it is upon this that Shakespeare's *Antony and Cleopatra* is based. Her life is the subject of monographs by Stahr (1879, an apologia), and Houssaye, *Aspasia, Cleopatre*, &c. (1879).
hours of the night as well as of the day. In the cloyster or
hydraulic clock of Ctesibius of Alexandria, made about 155 B.C.,
the movement of water-wheels caused the gradual rise of a little
figure, which pointed out the hours with a little stick on an index
attached to the machine. The cloyster is said to have been
known to the Egyptians. There was one in the Tower of the
Winds at Athens; and the turret on the south side of the tower is
supposed to have contained the cistern which supplied the water.

1879; G. Bilfinger, Die Zeitmesser der antiken Völker (1886), and
Die antiken Stundenangaben (1888).

CLERESTORY, or CLEARSTORY (Ital. chiaro piano, Fr. claire-
voie, claire étage, Ger. Lichtgaden), in architecture, the upper
storey of the nave of a church, the walls of which rise above the
aisles and are pierced with windows ("clere" being simply
"clear," in the sense of "lighted"). Sometimes these windows are
very small, being mere quatrefoils or spherical triangles.
In large buildings, however, they are important objects, both
for beauty and utility. The windows of the clerestories of
Norman churches are larger, in less importance than in the later styles. In Early English they were
larger; and in the Decorated they are more important still,
being lengthened as the triformion diminishes. In Perpendicular
work the latter often disappears altogether, and in many
later churches, as at Taunton, and many churches in Norfolk
and Suffolk, the clerestories are close ranges of windows. The
term is equally applicable to the Egyptian temples, where the
lighting of the hall of columns was obtained over the stone
roofs of the adjoining aisles, through slits pierced in vertical
slabs of stone. The Romans also in their baths and palaces
employed the same method, and probably derived it from the
Greeks; in the palaces at Crete, however, light-wells would
seem to have been employed.

CLERFAYT (or CLAREFAYT), FRANÇOIS SEBASTIEN CHARLES
JOSEPH DE CROIX, COUNT OF (1733-1798), Austrian field
marshal, entered the Austrian army in 1753. In the Seven Years' War he greatly distinguished himself, earning rapid
promotion, and receiving the decoration of the order of Maria
Theresa. At the conclusion of the peace, though still under
thirty, he was already a colonel. Duties, the outbreak of the
Netherlands in 1787, he was, as a Walloon by birth, subjected
great pressure to induce him to abandon Joseph II., but he
resisted all overtures, and in the following year went to the
Turkish war in the rank of lieutenant field marshal. In
an independent command Clerfayt achieved great success, defeating
the Turks at Mehadia and Calafat. In 1792, as one of the most
distinguished of the emperor's generals, he received the command of
the Austrian contingent in the duke of Brunswick's army,
and at Croix-sous-Bois his corps inflicted a reverse on the troops of
the French revolution. In the Netherlands, to which quarter
he was transferred after Jemappes, he opened the campaign
of 1793 with the victory of Aldenhoven and the relief of Maes-
tricht, and on March 18th mainly brought about the complete
defeat of Dumouriez at Neerwinden. Later in the year, however,
his victorious career was checked by the reverse at Wattignies,
and in 1794 he was unsuccessful in West Flanders against
Pichegru. In the course of the campaign Clerfayt succeeded
the duke of Saxo-Coburg in the supreme command, but was
soon recalled and replaced by his former antagonist, and
only crossed the Rhine in 1795, now field marshal, he commanded on the
middle Rhine against Jourdan, and this time the fortune of war
changed. Jourdan was beaten at Höchst and Mainz brilliantly
relieved. But the field marshal's action in concluding an
armistice with the French not being approved by Thugut,
he resigned the command, and became a member of the Aulic
Council in Vienna. He died in 1798. A brave and skilful
soldier, Clerfayt perhaps achieved more than any other Austrian
commander (except the archduke Charles) in the hopeless
struggle of small dynastic armies against a "nation in arms."

See von Vivenot, Thugut, Clerfayt, and Würmer (Vienna, 1889).

CLERGY (M.E. dergie, O. Fr. clergie, from Low Lat. form
clericia [Skeat], by assimilation with O. Fr. clergé, Fr. clergé,
from Low Lat. clericatus), a collective term signifying in English
strictly the body of "clerks," i.e. men in holy orders (see CLERK).
The word has, however, undergone sundry modifications of
meaning. Its M.E. senses of "clerkship" and "learning" have
long since fallen obsolete. On the other hand, in modern
times there has been an increasing tendency to depart from its
strict application to technical "clerks," and to widen it out so as
to embrace all varieties of ordained Christian ministers. While,
however, it is now not unusual to speak of "the Nonconformist
clergy," the word "clergymen" is still, at least in the United
Kingdom, used of the clergy of the Established Church in con-
tradistinction to "minister." As applied to the Roman Catholic
Church the word embraces the whole hierarchy, whether its
clerici be in holy orders or merely in minor orders. The term
has also been sometimes loosely used to include the members
of the regular orders; but this use is improper, since monks
and friars, as such, have at no time been clerici. The use of the word
"clergy" as a plural, though the New English Dictionary quotes
the high authority of Cardinal Newman for it, is less rare than
wrong; in the case cited "some hundred Clergy should have
been " Some hundred of the Clergy."

In distinction to the "clergy" we find the "laity" (Gr. λαός,
people), the great body of "faithful people" which, in nearly
all nations, comprises the "laity" of the Christian Church, stands in
relation to the clergy as a flock of sheep to its shepherd. This
distinction was of early growth, and developed, with the increasing
power of the hierarchy, during the middle ages into a very
lively opposition (see ORDER, HOLY; CHURCH HISTORY;
PAPACY; INVESTITURES). The extreme claim of the great
medieval popes, that the priest, as "ruler over spiritual things,"
was as much superior to temporal rulers as the soul is to the
body (see INNOCENT III.), led logically to the vast privileges
and immunities enjoyed by the clergy during the middle ages.
In those countries where the Reformation triumphed, this
triumph represented the victory of the civil over the clerical
powers in the long contest. The victory was, however, by no
means complete. The Presbyterian model was, for instance,
sacredotal in its essence as the Catholic; Milton complained
with justice that "new presbyter is but old priest writ large,"
and declared that "the Title of Clergy St Peter gave to all God's
people, its later restriction being a papal and prelatical usurpa-
tion (i.e. 1 Peter v. 3, for κληρικοί and κληρικόν).

Clerical immunities, of course, differed largely at different
times and in different countries; clerical bodies having been
gradually curtailed from a period a little earlier than the close
of the middle ages. They consisted mainly in exemption from
public burdens, both as regards person and pocket, and in
immunity from lay jurisdiction. This last enormous privilege,
which became one of the main and most efficient instruments of
the subjection of Europe to clerical tyranny, extended to
matters both civil and criminal; though, as Bingham shows,
it did not (always and everywhere) prevail in cases of heinous
crime (Origines Eccles. bk. v.).

This diversity of jurisdiction, and subjection of the clergy
only to the sentences of judges bribed by their esprit de corps
to judge leniently, led to the adoption of a scale of punishments
for the offences of clerks avowedly much lighter than that
which was inflicted for the same crimes on laymen; and this in turn
led to the survival in England, long after the Reformation, of
the curious legal fiction of benefit of clergy (see below), used
to mitigate the extreme harshness of the criminal law.

CLERGY, BENEFIT OF, an obsolete but once very important
feature of English criminal law. Benefit of clergy began with
the claim of the priory of Caen in the 12th century that every clericus
should be exempt from the jurisdiction of the temporal courts and be subject to the spiritual
courts alone. The issue of the conflict was that the common
law courts abandoned the extreme punishment of death assigned
to some offences when the person convicted was a clericus, and
the church was obliged to accept the compromise and let a
secondary punishment be inflicted. The term "clerk" or
clericus always included a large number of persons in what
were called minor orders, and in 1350 the privilege was extended to secular as well as to religious clerks; and, finally, the test of being a clerk was the ability to read the opening words of verse 1 of Psalm lii, hence generally known as the “neck-verse.” Even this requirement was abolished in 1705. In 1457 it was enacted that every layman, when convicted of a clergiable felony, should be branded on the thumb, and disabled from claiming the benefit a second time. The privilege was extended to peers, even if they could not read, in 1547, and to women, partially in 1622 and fully in 1692. The partial exemption claimed by the Church did not apply to the more atrocious crimes, and hence offenses came to be divided into clergiable and unclergiable. According to the common practice in England of working out modern improvements through antiquated forms, this exemption was made the means of modifying the severity of the criminal law. It became the practice to claim and be allowed the benefit of clergy; and when it was the intention by statute to make a crime really punishable with death, it was awarded “without benefit of clergy.” The benefit of clergy was abolished by a statute of 1827, but as this statute did not repeal that of 1547, under which peers were given the privilege, a further statute was passed in 1841 putting peers on the same footing as commons and clergy. For a full account of benefit of clergy see Pollock and Maitland, History of English Law, vol. i. 424-440; also Stephen, History of the Criminal Law of England, vol. i. E. Friedberg, Corpus juris canonici (Leipzig, 1879-1881).

CLERGY RESERVES, in Canada. By the act of 1791, establishing the provinces of Upper and Lower Canada, the British government set apart one-eighth of all the crown lands for the support of “a Protestant clergy.” These reserves, after being for many years a stumbling-block to the economic development of the province, and the cause of much bitter political and ecclesiastical controversy, were secularized by the Canadian parliament in 1854, and the proceeds applied to other purposes, chiefly educational. Owing to the wording of the imperial act, the amount set apart is often stated as one-seventh, and was sometimes claimed as such by the clergy.
